If we could get a 68030 board out for the ST, I'd bet the people at Codehead wouldn't sleep for weeks, just thinking of new things to do. The 68030 is very far ahead of the 68000 and opens up all kinds of possibilities. But software compatibility ought to be very high, since the 68030 is very compatible with 68000 software.

We will also "clock" the 68030 processor at a much higher speed than the ST's 68000. The ST runs at 8 mhz (millions instructions / second); we'll go for at least 16 Mhz and possibly more.

The primary intent of the 68030 board will be *speed*. While it is difficult to estimate the speed improvement, we're confident of at least 4 - 8 times speed increase.

Why not an exact figure? Well, it's the old drag-racing adage:

Speed costs money; how fast do you want to go?

For instance, we can use a 25 mhz 68030, the same processor as in the new NeXT and Mac IIci, but it will cost a lot; a 16 mhz 68030 would be much less expensive. We don't want to make a product so expensive that ST owners can't afford it; we want this to be a *practical*, *affordable* upgrade for ST owners. We want to keep the pricing as far under $1000 as we can, probably with options to let a user expand later as their budget can afford.

[Of course, I'll probably put a 25 Mhz 68030 in mine...]

Memory Limit

We also want to "break" the 4 megabyte memory limit. We see no reason why the ST shouldn't be able to go to 12 megabytes with a bit of work, and with a faster processor, there will be plenty of uses for that memory. (If nothing else, the digitized music industry could really use extra RAM to hold digital samples. But imagine a 10 megabyte Ramdisk...). This will also solve the primary problem of why it's hard to accelerate the ST: video contention.

Compete with TT? Nope.

We aren't trying to compete with the Atari TT here, either. The TT is a completely new machine, with multiple serial ports, VME slots, new high res color modes, and so forth. For instance, the UNIX option is definitely not intended for home users! What we are trying to do is give your ST enough horsepower to extend its useful life some years.

That's a brief, 83-line intro to the Gadgets 68030 project. Again, we're certainly going to do one of these for us, to make code development for Spectre/GCR much, much faster; we're interested if anyone else out there wants a very fast, large memory ST.

-end-

Okay, that's the "brief" intro. Hope it came through ok!

Here come the questions...

<[Bruce] B.HANSFORD>
Dave - this sounds great. Question - how will the speed of a 16mhz 68030 compare with an accelerator board like T16? ga

Well, it's a difficult question -- apples and oranges. Whups, I shouldn't say "Apples". Anyway. The 030 has a different architecture and generally runs faster, and does more, at 16 mhz than the 68000. A real whiz like Jim Allen could tell you exactly why. Now the present T-16 board ends up at around 12 Mhz in best case, because it's fighting with video memory;

Yes the 030 will kick butt!

(heh!)

The 68030 will run without fighting with memory, and is more efficient to begin with. We are confident in the 4-8X speed improvement.

But it isn't cheap...speed costs money.

How much? GA

Jeff -- it depends on the Mhz model of 68030. 16 mhz is ok, 25 is $$.

And 33 is $$$$$.

So to try to answer the question, the T-16 is around 12 mhz, the 68030 in equivalent terms is probably a 20-25 mhz 68000 .. .Jim, think that's fair?

Yah, equal to a 25Mhz 68000.

Is it just a matter of simply putting in a new cpu or ...?

Well, it's a whole circuit board. It will take over the function of the 68000 and delegate the 68000 to things like disk I/O. There's several ways to do it: chop out the old 68K and replace it; plug into Mega slot; piggyback 68000 -- and so forth. This isn't that major a design consideration, actually. (Not exactly an answer, but it's the truth right now.) .ga.

<[Jim] J.HARRISON4>
So it isn't a new motherboard right...

That's correct. We want to use the present ST keyboard, display, etc. as is; we want to accelerate the main ST with the software you use.

<[Jim] J.HARRISON4>
it will be a plug in so we still have reverse compatibility right?

(Oh, yes -- you can always "go back" to 8 mhz.)

REAL 8Mhz!!! 68000 8Mhz!!!

[By the way, if you're asking a question, do feel free to let me know if you're interested in such a board -- more or less the point of the CO. And suggestions are welcome.]

<[Jim] J.HARRISON4>
Sounds good, something will always be incompatible and I hate to lose the ability to run some stuff. I have everything you ever built and I don't see any reason to stop now, good show. That's all for me .ga.

Me too. It's important to stay compatible -- hence the emphasis on that with GCR.

Thanks, Jim! Okay, 1 yes, 0 no. We're winning.

2 parter: first, I think this'd be a great hack *if* you could pull it off. But I see a lot of problems. First of all, what TOS is it gonna run? Do you plan on licensing TOS from Atari?

next question? (grin)

Suppose we could just leave it in Spectre mode.

No, seriously, when there's a will, there's a way. The old 192 K ROMs may not appreciate the 68030, but the Mac ROMs didn't appreciate the ST, either, and golly, they work.

Heh.. that'd work Okay, second question: My understanding right now is that fast cache memory would be more limiting than the price of the actual CPU, and you're gonna want a lot of cache memory

on this thing for it to work effectively with ST RAM right? ga

Well, ST RAM is effectively video shifter limited. So we either kick the shifter onto a dedicated 32K static RAM, and free it up for 16 Mhz use, or just blow it off. With RAM prices toppling faster than Ken's UNIX hairdo, we feel that leaving RAM up to the user isn't a big problem. Buy as much as you want.

Limiting the video memory will cause you a _lot_ of compatibility problems, but I think you should be able to figure out a way to work it out. Well, best of luck!

You mean like the Moniterm Ken?

Exactly, Jim.

Thanks, Ken. We got your resume, and will look at it tomorrow.

Not if you keep a 640X400 res!!!! Just point at the static ram!!!

Righto -- the static can be mapped anywhere.

Before we continue, all of you may have noticed that Dave isn't alone here. Jim Allen is the maker of Turbo 16 accelerator. Dave, would you care to explain Jim's presence here?

Oh, Jim's the leading 68030 guru I know of, and is a good tech advisor so I thought it might be prudent to have him along.

Dave is the SW guru!!!

Also, Doug Wheeler is online, too.

Hi.

The HW is not a big deal...this is a SW project!!!

Anywho, it's entirely possible that Jim might have something to do with this board ..

<[John] JJKENNEDY>
Jim, will there be an upgrade path with the T-16

Too early to tell...

I'm sure we can work something out!!!

Agreed. Next!

$10 trade-in?

(isn't this nice.. not ONE "where's my GCR" question!!)

A zero missing I think...

HOW ABOUT DOING SOMETHING WITH A 68881 WHICH WOULD BE CHEAPER
AS YOUR START ARTICLE STATES 10-30X SPEED UP IS POSSIBLE

Very few ST applications use the 68881 floating point unit. The software must be written with the 68881 in mind, and as far as I know, DynaCadd is the only one that does it. Otherwise the 68881 is just a lump.. does nothing.

Chicken and egg.

Does that ansdwer your question?

COULDN'T A TSR REDIRECT SOME FP TO THE 68881 AND AWAY FROM THE 68

68881 is only useful for floating point math, not general operations.

YES BUT MUCH OF WHAT ONE WANTS FROM A 030 FOR SPEED INVOLVES GRAPHICS MANIPULATION INCLUDING THE MATH

Not really ... mostly programs do the math inside themselves, and don't even bother to ask if a 68881 is there to help them.

The ST doesn't have a "system" math library that can be FIXED like the Mac.

I agree. So we give *present* software a major acceleration, and let the software writers fix it for 68881 whenever they get around to it.

Mac SW will imediately use the 881/882 in Spectre mode on the 030 board !!!

<[fred beckman] FB>
I Want one and I know where my GCR is!

Okay, that makes it 2:0 with Ken abstaining. (grin)

He'll bite...eventually

<[fred beckman] FB>
The 030 sounds like a great enhancement to the ST line.

Thanks, Fred. We want to give people a good upgrade path for as little as we can afford to.

Any ideas what effects the 68030 would have on PC-Ditto II or GCR?

I don't know on PCD-II, since I haven't seen one. The GCR, it would make scream -- very very fast Mac emulation. Excuse me, I'm slobbering on the keyboard.

HW emulators will be uneffected.

<[Min] MINSYEE>
Dave, I want one... (Hello, Businessland: cancel that order for the IIci :-)

hehehehehe!

<[Min] MINSYEE>
Couple of things, Dave. First, there's no doubt in my mind that you're the person to do it if it can be done...

(oh, we're already doing it. Not to worry.)

Secrets...

<[Min] MINSYEE>
...just wonder about fitting that in with the other demands of Spectre development. Other thing is: the installation?

Second question first.

I think easiest "installation" of course is a Mega-plug-in, but that locks out 520/1040 owners. That's just a push-in-board. A T-16'ish replace 68000 installation isn't all that impractical. But really, there are so many ways to hook into the 68K bus, it isn't that important.

First question: It fits in nicely with Spectre development. We started out witrh the idea to get a faster machine to speed up assemblies, and other Spectre development (assembling Spectre takes *forever*!). It's a natural ouytgrowth of that.

<[Min] MINSYEE>
A big part of the Spectre success is that it's a plug-in.

Remember, we're more discussing the idea here, not what pin connects to what pin -- whether or not a high horsepower ST is something that's wanted.

<[Eric] MAJOR-HAVOC>
Could this board also have a SCSI port? My vote: YES, do it!

Hmmmm. The NCR 8530 supports SCSI pretty directly. But with ACSI, is there a real need for it? Atari's DMA is mighty, mighty fast. Jim --opinion?

I think the ASCI is good enough!

<[Eric] MAJOR-HAVOC>
ok thanks, hope it all goes well! ga

Certainly an interesting idea, though -- would help us in Mac emulation in GCR.

Some things are tougher than others

(Is that a vote? It's 3:0, 1 undecided, 1 unrepentent)

Mac compatibility would drive it.

dave would this 030 board be linked to spectre so you could run programs that would require the 030 like soft PC and some versions of excel and I vote positively YES!! to sell it!

Yes, it would, and thank you! The 128K ROMs support the 030 directly, with a little hacking ...softPC should run without any trouble, but you never know until you try it. Besides, pc-ditto-II should be pretty cool.

And you could use things like Virtual memory programs!!

You bet. Jim brings up an interesting point:

The 68030 is so powerful it can support many different machines *at once* in the same memory architectyure (if you have enough memory). So, with 68030 helping us in hardware, it would be easy to bring up an ibm/Mac/ST that would be a keyflip away between the machines .. or, multiple STs, where if one ST crashes, the others keep right on going. The 68030 is really an amazing chip. .ga.

That's for sure!!!

That makes it 4:0:1

OK. The 68030 resides with the 68000. How about running Dave, how about MacII like graphics for DTP, CAD

Oh, I see. The 256K ROMs are required to support color as in Mac II, and they're not available on the market for sale, so I can't "do" them. (Or did I misguess the question?) .ga.

No, you got the question. Just looking for better graphics that the 68030 might support...

Primarily, the speed improvement will make a big difference.
However, I will say we're thinking about just-for-fun tossing in one of thos
e ultra-high-powered TI graphics chips ... I mean, if we have 5 meg of RAM, a 68030, and so on, why not add a video output? That's very undecided, though.

<[Dave Troy] TOAD-SERV.>
Dave: three things - 1) YES I want one - can we trade for Toadfile 44 carts? ;-) 2) I got all my GCRs today! ;-) (again) and 3) This isn't my area, but how are you going to implement memory, in terms of installation & managment, how will it fit (physically) and what will be the fate of the old MMU in light of the built in MMU in the 030?

The new RAM will be on the 68030 board. There will be an interface, some way, into the ST's old memory, provided we don't decide to shut down the shifter and use it directly at 16 mhz. The 68030 handles most of its own memory management. For right off, I'd give it a straight memory map, but that's all programmable, for all the hackers out there, to do all sorts of fun stuff! Does that answer the question?

<[Dave Troy] TOAD-SERV.>
Yes - Dave it sounds funky! I am sure you can do it. Count me in for a few dozen.

Okay, 4+a few dozen:0:unrepentanty holdout.

Any connection with HyperWeb here?

Doug: Noper. HyperWeb is a DOS project -- software.

Lots go'in on?

oh yes .. plenty going on..

Availability?

HyperWeb -- no availability announcement for some time, I
would expect.

Dave, how about "Spectre GCR030, The Premier Macintosh IIci Emulator"?

hehehehehehh! You've just rolled Sandy on the floor. Mind if we
steal that?

Nope, you can have it. Any Idea of time frame? ga

Time frame...hmmm. Well, it's a bitch to get something to market.
However, I'm told that the elves at Santaland are busy with CAD
programs laying out PCB's, so, if people are interested, we'll put
more resources into the project.

OK, I have a few Ques. I'll try to be quick.

Go for it, Dave. I'll try to interrupt

Back to which TOS? You said a hac of old TOS?

There's several ways there, dependent partly (but not completely) on
Atari.

It would have to handle the problem of different type of stack frames
on traps.

That's easy enough..(Apple does it in their MacTrap handler)

Are you thinking about writing a TOS "emulator" to handle "bad"
programs (i.e. the real cheaters)?

Atari should do that for the TT!!!

Oh, heck, we might just kick the old 68000 back on and let it run that
way, if necessary. I presume we'll break a few programs, but a vast
number will work, and that's the point. In the Mac world, we broke a
few badly written programs, but all the important stuff worked.

You said that there was RAM on the 030 board, 32-bit right?

The ram will be 32 bit and might even use a second MMU chip

I believe otherwise the 68030 loses speed.

How about a VM RTX? Can you say Demand paged RTX. AHH OOOO NOOO!

"Demand Paged RTX". ?

What do you think of the idea?

Very interesting. Have to admit I hadn't thought of it. Let's talk later.

("VERY interesting idea.)

Yep.

Kinda makes your finger tingle, doesn't it Jim?

A pretty good reception.

Will mac 030 software compatibility be a problem since apple at 512K ROMS?

No. The 128K ROMs are 030 compatible.

No

I'm sure a few dumb PD programs will break, but big deal ... all the major stuff, and most of the minor stuff, will work.

Lots of 030 accelerators for Macs

on another topic has GCR Problem with GTS-100 drives been solved

We've found that many GTS-100 drives have problems reading from track 65-79. We have a GTS-100 that we bought here in town and have it spread out here in front of me, with a 'scope hooked up to it, probing its innards. Doug is handling anesthedia, I believe. Anywho, nothing solid yet -- we did get an error-free session, but it didn't repeat nicely. We do have a good idea what's wrong, though.

Dave, I want one, too! And since you mentioned it a few minutes ago, where IS my GCR (didn't want to dissappoint you!)?..

What's your zipcode, please?

Seriously, I'm told it's on its way, but I'm getting impatient

Need your zipcode..

02889

Okay, Sandy is looking it up. Next question while she does?

nothing else from me, thanks.

Ronald Perry, right? It weas shipped last Tuesday, the 31st. Heck, you should have it or darn close..

okay, next question?

Dave, can you do anything to get output to a projection TV so I can demo the GCR at Mac meetings ?

Hmmmmm. That's beyond my knowledge. I know at Comdex last year
they had a big screen hooked to monochrome; you could ask Frank Foster at Atari
how they did it. That's all I know, though.

An overhead project hookup is around but costs $$$.

OK save a 68030 for me.

Of course, there's always the Moniterm. Okay, that makes it several
dozen:0:Ken (grin). Thanks! .ga.

Hahahaha

I've heard that the Spectre won't work with programs that use Midi/SCSI
to talk to musical instruments (i'm thinking of Alchemy for ex.).
Will the new board allow this? g.a.

It is true that Spectre won't work with only the MIDI Input-Output
portions of various Mac MIDI programs (like Opcode Systems, etc,
et all). It is possible that the mapper function of the 68030 could
fix that. Interesting, interesting idea! HmmMMMMmmmm. Thank you.

Follow up - Consider using a Stacy with an 030 running this s/w.
Portable MAC for music purposed s but much more reasonable. ga.

Sure be nice. I dunno, though; many musicians tell me the ST is far
superior in music software (but those discussions are always sort of
like religious discussions). Still, a darn-fast-Stacy wouldn't hurt,
either -- particularly if the faster MIDI implementations get
standardized.

Speaking of Spectre, we had a mild event this week --

Microsoft Word 3.02, my old old enemy, came up this week and worked.
.. I fought that $%^#@$%^ thing for 1 1/2 years, beat it this week.

Mr. Wizard strikes again!!!

The program was reading "from" 0, not writing to it. This also
appears to have greatly styabilized Multifinder. Jim's Zax found Yet
Another Bug... anyway, back to the "0-3-0-CO".

<[Norm] N.RECHTMAN1>
Dave, back to the drive question

Hi Norm!

<[Norm] N.RECHTMAN1>
Are there other manufacturers drives having problems? I know John
Wyncott is having a strange problem with a diverse data drive, MFD 720.
I was wondering if the TEAC mechanism was stable?

Not consistently. There are always onesy-twosy problems -- bad drive,
alignment problems -- but the two consistent ones we see are RFI
problems inside the Mega case, curable by shielding, and the GTS-100
drive (an NEC drive), which we haven't solved -- but we've only had

the drive a few days, give us a little time. I've been repeatedly assured that these drives absolutely *can* read/write Mac data if something is not interfering with them.

<[Norm] N.RECHTMAN1>
One other thing, it seems that a few of us are having problems copying disks from the Spectre menu like Spectre to mac or even the same type.

Hmmmm. I'll look in the Gadgets RT. Always possible there's a bug in the code. (Does work okay here in testing, so it might be a bad copy of Spectre, or might be some glitch we didn't figure on. Please post a note in the Gadgets RT summarizing what happens, okay?)

What is '**CAUTION RESTORE failed in XRESTORE**' ??? '030 board, YES!!!

Well, that's a goof of mine. Inside the Spectre GCR software, there is an internal self-test routine, only meant for us to use. At the last second, we decided to let users look at it. It had some bugs, though --- for instance, if you run it with one drive, it hangs, repeating your message. (And other cases). So we released a New, Much Better tester for the GCR, that Doug wrote; it's in the Gadgets Library. (Please use it instead!!)

I am having problems ejecting disks, am I having trouble WRITING to them??

Are you using Finder 5.3?

yes I am using single 1040 drive system/color. I believe that it is 5.4, I just got this 3 hours ago!!

Try "dragging" the disk icon to the trash to do ejects. Those finders always were twitchy.

I also have 6.0.3 but so far it has not been able to boot/ I did the drag, no luck

That should always work; we do that here. 6.0.3. -- you probably need boot sectors.

6.0.3 came right off mac II

Tell ya what, this is best left for the Gadgets RT -- lots of people there that are new owners, too. (Right -- did you run Installer to get it?) See, a straight Mac II System isn't right for us -- it's configged wrong.

Ok, I just stopped here first, I was surprised to find you here tonight, THANKS

Anywho, drop by the Gadgets RT and see if they can't help -- you're welcome!

Dave/Sandy, FYI, my GCR came today! Up and running in 5 min, using Toshiba 3.5" drive. One more vote for new project!

good to hear! thanks!

<[John] JJKENNEDY>
If this project is a go, who will market it? GBS, Fast-Tech,
both or.....ga.

Probably some sort of co-operative venture. It's more important to us
hardware/software hackers to define the project first, then set up the
legalisms.

<[John] JJKENNEDY>
Thanks.....And YES!!

Gadgets certainly wants it, though, and with some of the income from
the GCR, I want to plow it back into the ST community and do good
things.

Exactly, we need the combined expertise to pull it off.

Not to mention customers (grin)

<[Wilton] W.VARGAS2>
Night everybody, I just got here so excuse me if I am asking something
that somebody asked before but, any plans for a MAC II emulator for
the TT or the ATW? .ga.

Nope. The ROMS for it aren't freely being sold -- first requirement.

<[Norm] N.RECHTMAN1>
Why doesn't someone make a Memory upgrade for the ST that uses SIMMS,
???

Probably space considerations. The ST isn't very tall.

Too big a form factor.

And it's too big a form factor.

Hehehe

<[Norm] N.RECHTMAN1>
Oh well

We'll probably use sockets for RAM as well, although that is not
certain certain.

<[Eric] MAJOR-HAVOC>
How long before Gadget Labs have a working 68030 board? .ga.

Remember, all, this is NOT a promise to do this project and market it;
this is market research. We don't know yet. (I shudder when I hear
the word "working". Getting boards -- the process has started. Getting
them WORKING -- that's a whole 'nuther kettle of wax.)

1. where's my gcr? area code 02135

okay, it's being looked up

2. what happens to the current ram in the computer if you plan to have ram on the 030 board?

Keeps on trukin

Depends on if we decide to use it for anything. There is a possibility we have to investigate of using it in 16 mhz mode, or just using it for 68000 local functions.

Your GCR was shipped Halloween.

(What, is UPS running ultra-slow or something?!?)

3. i would buy one, if you leave a socket for the 030, so i can buy a 16Mhz or 25 or 33 Mhz depending on $$$ i have available

That's how I want it, too. Remember, a big Mhz 030 costs BIG dollars ..

It ain't that easy...the Mhz impacts the design.

Sure does. But I'd like a faster CPU option as well. However, even 16 would smoke right along.

<[Double Click] M.VEDERMAN2>
Hi dave and jim... I came in late too (sorry :-)

Hi Mike .. our Jamie is enjoying your Double-Clicker. A new love interest will soon enter your life, and, you will soon receive a raise. next?

<[Double Click] M.VEDERMAN2>
Let me ask a couple questions, which may be premature considering this is market research, but will TOS 1.6 (030 TOS) be compatible, or plans for it to work?

NO COMMENT!!!!

hehehe. No, seriously, it's one thing we're looking into, but we don't want to bias Atari on this issue.

<[Double Click] M.VEDERMAN2>
another Q... Could higher than 16 mhz be acheived, or would y'all have to use an onboard clock?

Anything can be done, but it can cost more. 16 seems most approachable, but I'd be willing to pay for 25 capability. Question is if anyone else would.

We would use the 32 Mhz clock in the ST!!!

This thing will be a rocket even at 16, though. 32 would run socks off of several 386 systems I know.

<[Double Click] M.VEDERMAN2>
Three... Ready to open the 'compatibility' can of worms that this will surely open?

Someone has too.

I don't really think it's that bad. Sure, there's stack frame problems -- but with the TT, they'll all be raised anyway, so we might as well get started. It's nearly an identical issue.

Lots of stuff will work, lots more will work with a minor patch, a few things will break horribly. This is why we have Codehead software. Someone's gotta fix these things.

<[Wilton] W.VARGAS2>
Exactly what are the projected benefits, speed increase and compatibilty of the 68030 board?

It's unanswerable at this point. We're asking more marketing questions than giving exact numbers, because the amount people will pay will affect the product a great deal.

<[Wilton] W.VARGAS2>
If it speeds up CAD-3D, then you have my support!

So, I can't project exact speed, because I don't know the exact speed yet, and so forth. We're asking if people are interested.

<[Wilton] W.VARGAS2>
Any defined price range?

I hate to seem like I'm dodging the subject -- ask me when I get a wirewrap board.. (grin)

by the way has my gcr been shippred yrt? 02192

Sandy's shut down the Mac II, alas ... sorry .. can you email me?

okay

(it probably has --)

<[Wilton] W.VARGAS2>
Is the GCR a cartridge or it goes inside the computer? Also does it work with the STacy?

GCR is a cartridge, and it works fine with Stacy. In fact, Doug is on tonight on a Stacy, so we know.

<[Wilton] W.VARGAS2>
will it work concurrently with the PC ditto II?

Incidentally, if you make it to Comdex, please drop by the Atari booth and say hello. It's nice to meet the faces behind the names.

<[Wilton] W.VARGAS2>
I WISH I COULD!!!!!!!!!!!!!!

Not concurrently (at same instant) but they don't fight each other. Ah, with a 68030, they might be able to... (no kiddin'..)

<[Wilton] W.VARGAS2>
so its possible to have both things at the same time and that would mean you have three computers on one?

Yup -- well, it works that way now -- you just select the computer type you need and boot up into it. Switching is just a reboot.

<[Wilton] W.VARGAS2>
That 030 will be a great thing to wait for!

<[John] JJKENNEDY>
How compatible will the 030 board be with the TT (if at all)? Will some/many/most prg written for the TT work on the 030 upgrade?

Very compatible. Very. However, the TT has features the ST does not in the screen, etc, and in sound, that it couldn't be backwards compatible with.

Yes unless they are using the TT specific video wonders.

Give me a video chip and a star to steer it by -- we'll see what we can do.

<[John] JJKENNEDY>
OK Many thanks!

So you're really looking at a very, very, very, fast ST basically?

Jeff > Yes indeed. An ST that'll be fast enough to compete in the 90's. Remember, the ST is basically a 1985 design ... it's time it was brought up to date with the NeXT and Mac IIci speed.

<[Norm] N.RECHTMAN1>
How did Doug get a STacy, did he borrow Donny Osmonds?????? When are they gonna be released?

We haven't been told. No one knows. (Doug is currently dating Marie Osmond, is how)

oh? :-)

errrrrrrrr I'm sorry, I can't answer that one -- legal agreements and nondisclosures.

So *that's* who she is!

<[Wilton] W.VARGAS2>
what exactly do you mean with "barely' seen a TT"?

also any graphics upgrades on that fabulous mind?

they're a definite possibility. I'm a big fan of TI graphics chips.

<[Wilton] W.VARGAS2>
AAH! I wish I would be an insider!

me too!

<[Wilton] W.VARGAS2>
that's it! thanks and go ahead! (but you know more than I!

thank you!

That's about it for the formal part....

Thanks folks!!!

Thanks all for coming. Thanks to Dave, Jim, and Doug. Before we open this up, any closing remarks?

I'd like to thank Dave for typing all the replies I was feeding him! (Just kidding *grin*)

Let me add my thanks for all of you for attending the conference and for the interest shown! While I'm not absolutely positively promising this as a product, we're certainly talking about this CO and the interest generated, as we did the Spectre 128 and its conference. The on-line networks bring a new way to gauge consumer interest if companies just will take the time to ask, and listen to comments. Thanks again for coming.

Doug: Good luck with Marie.

Again...thanks to all for coming.

2712. DSP, ATW graphics, TT/P

Newsgroup: comp.sys.atari.st
Date: 1989-11-12 23:20:15 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4415@blake.acs.washington.edu>
Source record: 247234

One of my main uses for the TT/[Px] will be to use
the hoped-for 16-bit DSP package by Digidesign along with
the hi-res graphics a la ATW. Since the TT/P has only one
slot.. i will either have to waitwaitwait for the TT/x or hope
that a backplane is available for adding more cards.

Unfortunately, the TT/P's 8-bit stereo sound capability is NOT
good enough for today's music and film standards. For games, sure. So
one will have to depend on third-party hardware/software developers.
This is perfectly acceptable. Digidesign, a major developer in the
music industry, an industry that ATARI prides itself on, is
unaware of the TT or the ATW. At least they had never heard of
either machine a couple of months ago. Digidesign has had a 16 bit DSP
workstation for digital recording on the Mac II for a while now.
In several long chats with various workers at Digidesign, i tried
to impress upon them what great developments were taking place
at ATARI. The last gentleman i spoke with said he would look into it
and find out about the TT and ATW. Again, he had never heard of
either of these machines. NOw there's not much more the consumer can do.
Buy products and tell people about them. BUT ATARI HAS TO CONTACT
ALREADY PROVEN SUCCESSFUL DEVELOPERS and let them know what they're
going to deliver in the future.... I hope someone from atari
proves me wrong. I'd like to know that a 16-bit DSP package is
in the making by a company that knows how to make one.

Try Forth. Forth is a reverse-polish notation threaded interpreted/compiled
language. It's most amazing power is that you can add new procedures to the
langauge that become part of the language (i.e. Regular Forth doesn't have
a CASE-type structure, but you can add one in, using Forth itself. Much
more powerful than just having dumb functions and procedures). There is
an excellent PD version out there Somewhere (somebosy else come to this
person's aid on this please), which can be upgraded to full GEM/AES useage
with a nominal upgrade fee, which you only need to pay after you have seen
and tried out the freebie version.

Send mail for more details on Forth (I am not a Forth guru, just a happy user).

>decided on one of two models,

> 1)ATARI ABC

> 2)AMSTRAD 2086

>Does anyone have/know of the machine and if so could someone please
>offer me advice on buying it?

More important than the technical differences between the two machines is the difference between the companies which make the computers.

Amstrad is a professional company which produces computers. They have established a world-wide reputation for delivering good, solid computers.

Atari Corp is a toy company which has established a reputation for being poorly managed, and for its capricious treatment of its users, dealers and suppliers. While the "Atari ABC" may be the computer of the week now, you may find yourself holding an obsolete system when they go off after the next glittering gizmo and leave you with an unsupported orphan next week.

Then again, maybe they won't... it's your gamble...

Andy Cassino mentions:

>ST magazines? Well, maybe Wall Street is the center of the financial world,
>but I can walk into any B. Dalton in a suburban shopping mall and buy
>more ST mags than I want or need.

Maybe you're easily satisfied with the three or four Atari magazines that are left in the market... unfortunately, you've got to cross ANALOG and ST-LOG off your list, since Atari Corp's capricious treatment of the US marketplace has forced ANALOG out of business after many years of trying to support Atari.

This leaves...?

STart (disk? nondisk? potluck, depending on the B.Dalton)
ST Informer (not bad, but never seen one in B.Dalton)
ST World (Bleeech.. besides, no B.Dalton would carry it)
Atari Interface Magazine (virtually unknown outside of Atari user groups)

Umm... I'm running out of options here... can you help me with some more of all those ST mags you want or need..?

The point is, magazine publishing is NOT an altruistic profession.. Atari Corp is playing with people's lives and livelihoods with their game playing. Who can afford to support a company like Atari when it becomes a decision between blindly supporting Atari, or eating..?

Like it or not, that's what it's finally come down to in the Atari world.

Jouni Alkio observes:

>I don't really understand why you (and many others) complain about the
>TT/P.

Well, what *I* don't really understand is why ANYONE gets very hot about
ANY of these supposed Atari "products"...

The ONLY thing the Atari Corp manufacturers and sells is the ST/Mega.

(Sorry about non-US markets, I guess there are mutant variations there)

Why worry about how many VME slots there may be, someday, in some theoretcal
product..? You can't buy one now, so why care about it..?

Why worry about the theoretical resolution of some still vaporware Atari
workstation..? The only thing you can *BUY* is 640x400 monochrome.

Atari has been *TALKING* for years about these other things... but still
selling the same old, same old...

Go down to your local (hah!) Atari dealer and check out the Atari TT/ATW/STE
and *then* worry about it...

Steve Whitney sez:

>THANK YOU Atari. It appears to me that you've been listening to what people
>want. What have been the main complaints against the ST hardware?

> 1) Memory not expandable: Taken care of in TT

Yes, thank you Atari.. .this only took since 1985

> 2) ACSI instead of SCSI: Taken care of, means cheaper disk drives

Yes again thank you.. only 4 years to come up to industry standards.

> 3) Only one serial port: Taken care of

Again, thank you.. my 8-bit Atari has only had 4 serial ports since 1979

>Most of the rest of the complaints are software-oriented. Give Atari time.

Yes.. let's give Atari time.. after all, it took them 4 years to upgrade the
operating system in the ST, and they still can't seem to fix GDOS, so let's
give them time. Maybe by the turn of the century they'll be able to come
up to 1980's standards.

>They have said unofficially, with no commitment to a target release date
>that there will eventually be a multitasking TOS. Someday. Not tomorrow.
>Unix should be available sooner.

I've also heard that someday pigs would fly... maybe with Atari controlled
computers..? Seems to me that I've heard about multitasking Operating System
on other computers *now*... Not tomomorrow.. Now..

Maybe a better advertising slogan for Atari would be:

"Someday, Over the Rainbow"

> I am looking into trying to learn a new computer language,
>but I really don't know which one to try out.

In my opinion, one of the most powerful higher level programmiong languages
around is ICON designed by Griswold (designer of Snobol4).

Its features include: List processing, Backtracking, generators, Coroutining,
String Matching, set processing, first class functions
etc.

Try it. Unless you are specializing in Programming Languages
(and by your posting it seems you are not) you are bound to be impressed.

Even if it is not suitable to you (which can only be true if efficiency
is particularly important) you will learn some useful programming techniques.

Thanasis

2729. Re: HDX 3.01

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 07:24:50 UTC
From: fortinp@bcara13.bnr.ca
Message-ID: <177@bnrgate.bnr.ca>
Source record: 247101

Allan,
While using HDX 3.01 to format my old 10Meg drive for testing purposes, I noticed a couple of anomalies...
1. After the format was done, the program claimed that it was checking the drive for bad sectors. Actually, the sector numbers were rolling along, but the drive's head positioning actuator was NOT moving. Then the actuator moved about 25% of the way in (like a seek); then about 50%, etc. There is no way the format program could be checking the drive properly with this kind of head movement. My drive's head actuator is fully visible which is how I noticed this anomaly.
2. Every time I format a drive with HDX 3.01, I ALWAYS get the message which tells me I have 8 bad sectors (no more, no less). Any ideas?

I recently obtained HDX 3.02 (actually, just the formatter). Apparently, only the formatter changed in this version. Is this the case? Can you tell me if the formatter was re-issued to cover the above situations? Or, was it re-issued for other reasons?

Thanks,
Pierre Fortin

Chip Robertson observes:
>... Atari's delivery record has left me feeling lacking, but I would like
>to accentuate a positive point. If it had not been for this network
>in general and Atari employees like Allan Pratt, Ken Badertscher,
>et al. clearing up rumors and providing solutions, my view of Atari
>and the ST would be quiet different.

What Chip and most others don't realize is that Allan's, Ken's and all the other Atari "representative's" presence here (and elsewhere) is *NOT* "official" Atari policy... anything these dedicated Atari people may say is *NOT* "official" as far as Atari Corp is concerned.

Neil Harris tried to parlay his "official" presence for favors from the various online services, and with the exception of the one run by his personal friend, failed at the attempt. For some reason, most of these online services refused to be "bought" by having an "official" person from Atari involved. Only the one his "buddy" ran bought into his peculiar brand of "public relations". On that service, his word was gospel law.. and anyone who didn't fall into line was *out*

Those who have been so helpful here on UseNet have been so on their own time.. and at their own peril.. information from Allen, Ken and the others from Atari has helped to fill the "official" vaccuum from Atari... and yes.. they do deserve the utmost thanks from ALL Atari users...!

>piece computer (an alternative to getting a Mega, if you are so inclined).
>The keyboard case is roughly the same size as a Mega's, and uses the
>original keyboard from the 1040/520. Pretty neat!

Neat? No way! The keyboard case is made of folded metal with a cut
top from a 520 or 1040 (depends on your machine). I bought two CPU
cases with all the trimmings, and the 1040 keyboard case is a piece of
junk. Not only is the keyboard case top cut crookedly, but the
keyboard sends out spurious signals because t*s didn't use all the lines!!!

>

>Correct me if I'm wrong, but as I understand it, VME is a multimaster bus
>which means that you can plug another processor board in there and let
>it control the system. Perhaps this is one of the reasons Atari chose to
>use an expensive bus standard.

True. Standard-VME is a multimaster BUS.
Ataris "implementation" in the TT/Personal (the one to come real soon
now) is not capable of multiple masters.

as someone@atari said, the TT/x (the larger machine, prototypes yet to
be seen) will have a 32-bit extended VME BUS capable of multiple bus
masters.

Very few VME cards are BUS masters. Most are slaves. So the TT/P's slot
will do almost everything You want it to do.

But why don't we all just shut up till the TT appears in the shops, till
we get facts/real machines thar rattle when falling down?

"Title Unknown"... that's pretty sad... Atari Corp has such a team of
excellent people and still doesn't know how to get the most out of them...

I hope that John, and Allan and Ken, and all the other excellent individuals
at Atari Corp. understand that my criticisms of Atari are directed at the
"top" management, and not at them...

If only Atari would let these individuals apply their ideas to how their
departments should be run, maybe we'd see a VERY different Atari Corp..!

> Steve J.

Well, as usual, the Atari Canada folks are showing their skin-flint nature if this posting is typical of US developers. Here in Canada, all we are getting from Atari Canada is a set of VERY BAD photocopies with TWO pages per single sided sheet. Yes, that makes each page a WHOPPING 5.5"X4".

We need magnifying glasses and have to be quite skillful at reading within context as most of the stuff is illegible.

Sounds like Atari US is beginning to provide better support for its registered developers. Now if we could only get Atari Canada to straighten out their act, things would start looking up.

Cheers,
Pierre

Richard Covert/Greg Lindhal debate:

>>In article <46bcb82f.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Cover

>Gee, Richard, I thought people had been explaining to you in detail
>exactly what the TT gives you.

The Atari TT gives you an Atari Cheerleader like Greg Lindhal..

There aren't any Atari products to compete with most of what the other
computer companies already have for sale, so you have to fall back on the
"someday, someday" cheerleaders...

>And to repeat: WHY DON'T YOU JUST SHUT UP AND LET THE MARKET DECIDE IF THE
>TT IS A GOOD MACHINE INSTEAD OF FLOODING COMP.SYS.ATARI.ST WITH MESSAGES
>ABOUT SOMETHING YOU'VE NEVER SEEN?

>>What has happened to Atari Corp??

>They are making money selling computers.

Atari Corp is making a lot of noise about IBM compatible "pocketable"
computers, and "handheld" video games. They are *NOT* doing anything
useful for their base of computer owners. Of course they can make money
anywhere they want to.. that's their right under our free enterprise system..
but.. do we as owners of their outdated technology have to kiss up to them??

Neil Harris of Atari Corp used to try to tell Atari owners to just
"shut up" if they didn't like what Atari was doing.. his reign as deity
of Atari information didn't last long. How long will Atari owners watch\
as they're once more passed by...?

>and fine.

>==
>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Does the discussion above mean that HDX 3.00
is freely distributable via BBSes.
If so, where can I get it if I don't
have access to these BBSes? Could it be
posted to binaries.atari.st?
Or was it already posted there?

Any info on this would be appreciated.

Another question: is TOS1.4 EVER going to be distributed in the
form of 1MBit ROMS (which can easily be inserted into yon
Mega ST without having to scratch around on the motherboard,
change MMUs and TTL drivers and all that useless effort)? Or
will it remain forever in the form of 6 Eproms/Proms/Roms. What
about people with a motherboard that doesn't have room for 6
ROMS?

Any info on this would also be appreciated.

So long, netland

You should write to them and ask. The answers are (1) probably, (2)
probably, and (3) probably not. Sure worked for me (in the opposite
direction) in dealing with the Smithsonian mail-order shop and with
L.L.Bean. Though I've probably got an edge since I still have a
checking account in my Boston bank.

> Secondly, what about American duty charges?

You pay them. If duty is due, you'll have to pick up the package in
person at the Post Office where they will collect the duty. (Sometimes
this seems to get ignored for smallish packages, depends how lucky you
are.)

> Finally, why is it that the more polished European ST magazines
>are CHEAPER than the U.S. magazines?

Probably to compensate us for the fact that the hardware tends to be
more expensive. :-) Actually, it's probably just competition. There
are probably about 10 ST-specific mags in the UK, plus of course other
'general computing' mags which give the ST more or less cover. The
population of the UK is on the order of 50 million (not all of whom own
ST's :-). In short, there are a lot of mags fighting for a share of a
small market.

Hello Graham,

thank you for your message on GDOS. It really shouldn't be that
mysterious, as i've learned from the mails i received. But there
is still a lack of DETAILED knowledge on my side. So could you
please send me the file you mentioned? Nobody else offered any
documentation of this kind.

Nice to hear that you know Stuttgart! I guess the punch card time
is over even at Hohenheim, but Hohenheim is still a nice place.
I ran my first FORTRAN programs also from punch card in the late
1970's, not in Hohenheim, but in Stuttgart-Vaihingen. A lot of
friends lived in Hohenheim then, most of them studying Biology.

Best wishes,

Benno

2748. I/O Redirection

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 14:24:42 UTC
From: piet@cs.ruu.nl
Message-ID: <1793@ruuinf.cs.ruu.nl>
Source record: 247120

It seems that I am having some problems with I/O redirection. What I do to exec a child with e.g. the stdout to some file:

```
temp1 = Fdup(1); /* save old stdout */
temp2 = open ("filename", O_WRONLY); /* Fopen or Fcreate */
if (temp2 < -3) {printf ("error");}
Fforce (1, temp2); /* set new stdout */
Fclose (temp2); /* no use for temp2 anymore */
Pexec (......); /* start child */
Fforce (1, temp1); /* reset stdout */
Fclose (temp1); /* no use for temp1 anymore */
```

Could it be that the close statements are giving problems?? It is not completely clear to me what is going wrong, but I have had strange malfunctions after execing a child like this. It could be that it has to do with using GULAM as a shell. I remember a question from Jahwar Bammi about this subject earlier this year, where a redirection gave also similar problems. I copy it to the end of this posting.

Could someone from Atari speak about the above code. Is this the correct way to do things?

From bammi's posting:

```
i had tried to include a redirection for stderr to console, so that
gcc applications would not need a wrapper shell to run in by doing
a
Fforce(2,(short)Fdup(1))
in crt0.s. This works fine, until you try to redirect stdout from
a shell (like gulam)
a.out > foo
what happens is that stdout and stderr end up in foo (another exotic TOS
bug -- is this fixed in tos 1.4??)
Now if you try to run this program a second time:
- i get error code -61
- eric smith reported that some files got trashed
so depending on your setup, i suspect one of the two will happen.
Please apply the patch enclosed below that backs out these changes, and
recompile and install crt0.o in $GNULIB. Hopefully we will come up
with a better scheme for stderr soon:
--
*** crt0.s~ Fri Mar 10 16:00:34 1989
--- crt0.s Fri Mar 10 16:01:00 1989

> Steve J.

i guess santa claus only lives in the states! we here at electrohome finally received our TOS 1.4 upgrade, with the rainbow tos upgrade notes. no 3 ring binder. in fact, the notes were bloody PHOTOCOPIES, which had poor contrast, and were shrunk down 60% to boot!!!!!!!!!! like, get your buns in gear atari. we didn't pay ~100 dollars for stupid photocopies which are hardly readable in the first place. the whole developer kit was a complete shambles (it came totally messed up inside an atari 800XL box!!!!!!!), with no binders, and no order to the notes. plus, most of the stuff was vintage 1985/86 notes, with no info on tos 1.2 changes, etc.

in all, the developer stuff is VERY UNPROFESSIONAL. i'm glad the company paid for the travesty, not myself. its too bad, because everyone here at electrohome is very impressed with the power and capabilities of the ST, but not with the support atari gives it.

also, it would be very nice (hint hint) if Ken B. and co. would mail out to all registered owners an official document concerning the extended argument passing scheme posted to the net a couple of days ago. i've taken that note and formatted into a somewhat professional looking document, but that still doesn't get atari off the hook for not releasing official stuff to its developers. and where are these newsletters???

anyways, back to programming the ST. i'd never leave this environment for anything (ok, maybe a Sun or Apollo), especially the MSDOS/OS2 and Apple world.

cheers.

From: esp_05@jhunix.HCF.JHU.EDU
Message-ID: <3287@jhunix.HCF.JHU.EDU>
Source record: 247122

Just some thoughts to add to the other thoughts about an outline GDOS:

1) Just now completing a course in computer graphics, I don't see how anyone could call outline fonts difficult to implement. Using scanline fill algorithms coupled with Bresenham's line and circle (ellipse) algorithms, not only would it be fairly easy to design a system that scales, but rotations would be just as easy. As for speed, well, couldn't be slower than the present incarnation of GDOS, no?

2) Regarding the point size inquire used by current GDOS programs, one could implement a program like Apples Font/DA Mover to load and unload fonts, AND specify what point sizes the GDOS inquire function should return.

3) Isn't there an info file about GDOS somewhere? I really know nothing about the present GDOS, except that Degas Elite seems to ahve a copy of it on the disk but also seems to run fine without it.

I'd be interested in collaborating with someone interested in making an outline font system. I've been toying with the idea of re-creating MacDraw II for the Atari with a few enhancements, one of them being outline fonts. Of course, this semester I overloaded my class schedule and have only used my computer for word processing and CS assignments.

Strikes me that older versions of GFA Basic are in the public domain. Although I don't know a whole lot about it because I don't use it, it strikes me that it has full GEM support, and that it's really easy to use. The one time I looked at it, I was also impressed by its editor. If I used BASIC I would probably be happy with it. (I must say, way back when I got my 520ST in what, '86 I guess, ST BASIC was a real disappointment.)

You need to run the .TEX files through TeX and then use a DVI viewer
to view the the resulting .DVI files. If you need more information on
TeX, you might post to comp.text ...

The shell program is for Personal Pascal, previously marketed by OSS in the United States and now by another company whose initials my mind has blanked on...

The compiler is not in the public domain, nor do I know of any version of Pascal which is PD. The actual cost for Personal Pascal (and most of the others avaialable for the Atari ST) was fairly reasonable when I purchased my copy.

2756. Clock chips for 1040?

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 17:06:12 UTC
From: BGB100@PSUVM.BITNET
Message-ID: <89317.120612BGB100@PSUVM.BITNET>
Source record: 247128

Hi there:
I am looking for any info on clock/date chips and cartridges for my 1040.
Christmas is coming up and I'd like to know where I can get one of this
for a decent price. I've seen prices around $40-$50 for just the time/date
setup. If you have one of these things, could you please tell me about your
clock chip, how it's used, name of maker and approximate price. I'd just like
to get a good one and not get stuck with a piece of junk. Please let me
know what you think!

Thanks!!!!

2757. Degas to MacPaint picture converter

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 17:07:12 UTC
From: rcd@cbnewsj.ATT.COM
Message-ID: <2251@cbnewsj.ATT.COM>
Source record: 247129

While playing with Superpaint under Spectre Mac emulation last week,
I said to myself, "Self, wouldn't it be nice to be able to convert
ST picture files to MacPaint format?"

I looked for a PD utility to do this, but found none. So I wrote one.

Right now it does the basic operation of converting Degas monochrome (.PI3)
pictures to MacPaint (PICT) files. Once converted, you can use the Transverter
utility that comes bundled with the Spectre software to get it to an MFS disk.

This opens up the possibility of incorporating .PI3 images (e.g., output
from an ST digitizer) within a wide range of Mac applications (e.g.,
MacPaint, MacWrite, Superpaint, Pagemaker, MS Word, etc.).

If you think this (GEM-based) program would be useful to you, please reply.
If there is sufficient interest, I will post it to comp.binaries.atari.st.

>I bought TWO (2) of their memory upgrades for my 520ST, and they
>DIDN'T work! It seems the instructions for installation were
>misprinted, and the owner wouldn't (or didn't know) tell me!

Did you ever get your memory upgrade to work? I purchased a 520A board
several monthes ago but only recently bought some 1meg chips. When installing
the chips I noticed the misprint in the instructions. Do you have the rest
of the instructions?

I haven't attempted to put the board in the machine yet (no time...), but it
didn't look that hard. Is there anything I should know about that's missing
from the misprinted instructions? I'm also going to contact those jokers
at tech-specialties to see what they have to say.

At the same time I bought the memory board, I purchased a hard disc. Didn't
work at first, but after removing and reattaching all the connectors, it did.
I get write errors every once in a while, but it has worked fairly well.

I'd like to hear more stories if you have some.

:I have just begun reading the AMiga newsgroup.
:I have an ATARI 1040ST .. am considering the Amiga 3000 or the Atari TTx
:
:Music: I use NOTATOR for the Atari. While The Copyist is also
:available for the ATARI, i can't see spending 1-2 hours per page.
:I did close to 300 pages one week for the Pacific Northwest ballet.
:Notation and midi-event data are fully integrated. No file conversion
:or program switching is necessary.
:
:I am reading this newsgroup to find out if anything like NOTATOR
:even exists for the AMiga... as i am growing very interested in the
:open architecture of the Amiga line and may in fact leave the ATARI world.

Unfortunately there is nothing close to the power of Notator for the Amiga.
It really is a pitty because the Amiga could probably blow the Atari
version from the water. Still, no one has really maxed the Amiga out in terms
of midi software or notation software. Notator is a remarkable feet of

software engineering on an average to above average piece of hardware.
I do wish the Amiga software developers would not rely so heavily on
the Amiga's hardware magic and instead (in addition to) push their software
creativity to the limits, as was done with Notator. I would give anything
to see C-Lab do Notator on the Amiga. Sigh, What a dream.

(To those Amiga users who have never seen Notator by C-LAB, I HIGHLY recommend
you run down to the nearest Music dealer who knows the Atari and Notator and
watch it run. You will be Amazed. I wish some Amiga music-software developers
would look at it and get inspired!)

2763. status of Gulam

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 19:28:27 UTC
From: pmateti@crimson.wright.edu
Message-ID: <835@thor.wright.EDU>
Source record: 247135

Over the past two years, I have recd several enquiries about improvements and bug fixes to Gulam. To all those, and the many others who found it useful and said so: I am grateful.

I would like to release a corrected version. The question of "when" is governed by two factors. One is that I no longer use ST on a daily basis. Two, I have not seen "correct" solutions to the many problems attributed to Gulam (such as the one re stdin/out redirection). I would like to recv "capsules" of solutions to such problems. Bugs caused strictly by the internals of Gulam are, of course, mine to fix.

Meanwhile, if there are others who have "fixed" Gulam, I have no problem if they post the binaries of such versions. I still hold the copyrights to the original src, and I am not giving permission to post the src. Authors of modifications, of course, do NOT need my permissions to post their mods (either in src or as binary patches).

The src of Gulam is available, as always free of cost, to individuals. However, having seen public comments by some who recd the src, I will be selective in who I will send the src to. It is not an easy program to understand without the design documentation, which I am not yet ready to release.

> move.w #$8000,d3
> cont: nop
It would have helped if you had included the code that was doing the
modifications. The 68000 does instruction prefetch. If you're modifying
code that's really close to the instruction that does the modification,
then you can lose (the chip is executing the instruction it prefetched,
rather than the updated instruction in memory). You can get around this
by sticking some nops in. A better solution is to eliminate the self
modification entirely. I *strongly* suggest the latter, because your code will
almost certainly break on the TT (which has a 256 byte instruction cache).

Hello netland,

Somebody recently asked how to intercept characters from the keyboard, including from the repeat function. An example for this can be found in the assembler source code, which I included in my posting of KBEXT 4.10 to S. Grimm (panarthea archive, "binaries group"). To remind you: KBEXT installs 5 keyboard tables for normal, SHIFT, CAPS-LOCK, ALT and SHIFT-ALT, together with other features.

Speaking about postings: could someone please post some of the nice PD games for >>monochrome<< monitors, like DRACHEN, GO_UP, OPUS_1, BUMERANG, RAMSES, MONOPOLY, CAVEMINER... (I know there are lots more)?

2768. ascii code

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 20:35:23 UTC
From: mjv@iris.brown.edu
Message-ID: <20664@brunix.UUCP>
Source record: 247140

This is a rather simple question but I can't find any answer in my limited resources, but what is the ascii code for the _Delete_ key? I need this info for a term program under Mac mode. Flash works fine but in Mac mode, it isn't send the right code (well the _delete_ is disabled but the backspace doesn't work either.) The term program has options to set key codes so I need the ascii for the break key under TOS so I can set it for the Backspace key under Mac...sigh
Thanks in advance.

The TT/P is NOT a UNIX workstation, not as it comes Off The Shelf.
Even John Townsend has said that UNIX will be available for the
TT/Tower and not the TT/Plastic. You COULD add more RAM, a bigger
hard drive and then install UNIX on the TT/Plastic. But, what will
Atari's policy be towards adding more RAM to the TT/Plastic?? If you
extrapolate from Atari's present policy with regards to the Mega ST2,
you won't be able to add more memory to the TT/Plastic. In fact, some
of the later pc boards for the Mega ST2 are NOT traced for 4 megs of
RAM, making it darn near impossible to upgrade a Mega ST2 to 4 megs of
RAM. I know this from my local ST dealer who HAS SEEN the Mega ST2
w/o pc board traces for 4 megs, and also with a special 2 megs only
MMU chip. So, who knows if the TT/Plastic will even be expandable to
more then 2 megs of RAM?? No one until they are released!!

Atari's official policy is that to upgrade an Atari computer you "dispose"
of your current Atari computer and buy a new model with more features.
Atari has NEVER supported end-user, or even dealer installed, addons.
Even when it is just a matter of adding RAM ics to a motherboard.
So, who knows if you will be able to expand a TT/Plastic??

>
> >And I mean the TT/Plastic as it is the most likely TT to make it
> >to the USA.

The latest "rumors" from Europe indicate 2nd Quarter 1990 for European
delivery of the TT/Plastic. and NO DATE for the TT/Tower. So,
when will we in the United States see the TT/Tower?? Who knows?? And there
are still European products which are not sold here in the States. The
entire Atari IBM PC clone line are sold in Europe, but try buying one here
in the States. So, just because a product is sold in Europe (read Germany)
doesn't mean that it will be sold here in the States.

> It will not be two times slower, which you would think from the ratio
> of the "megahertz". Megahertz are relatively meaningless.

Once again you didn't understand my comments. I was talking about upgrading the cpu in the TT not comparing cpus speeds between the Intel and the Motorola cpus. And it would be nice for Atari to design an upgrade to a faster 68030. Even if it meant replacing the motherboard the way Apple forces the Mac II users. At least then you could do it. But given Atari's track record not only will Atari NOT supply a faster cpu but Atari will design the TT so that a third party vendor won't be able to supply a faster cpu either. Atari has done this with the Mega STs already. Heck, there are plenty of folks who can't even use TOS 1.4 because the Mega ST won't drive the 6 EPROM set!! And other folks who can't drive both a hard drive and the SLM804 because the DMA port won't drive more then one load!!

>
> >2) ability to change to a 68040 CPU without buying a whole new

>
> Few if any other vendors supply this sort of capability. It costs
> extra money up front.

Tell that the Mac users!! Heck, a MAC SE can be upgraded to a Mac SE/30. sure it costs money but you can do it!! And Apple has made a fortune selling MAC SE to SE/30 upgrade kits!! So, Mac SE users can change from a 68000 cpu to a 68030 cpu w/o "disposing" of their current computer. That is definitely cheaper then trying to sell a used computer and then paying full-stroke for a new computer. But, once again, Mac users get more out of their used Macs

than Atari users get out of their used STs!!

Why can't Atari LEARN from Apple?? I guess Atari will be synonymous with
CHEAP in the future!!

What is so strange about asking for a multitasking multiwindowing OS??
Geez, if commodre can do it on a 68000 A2000 then why can't Atari do it
on a 68030 TT??

And just how FAR off in the future is UNIX for the TT?? given the fact
that the TT/Plastic won't be here in next summer, and the fact that UNIX
is intended for the TT/Tower, I would say sometime next century :-).

Color monitors capable of 800x600 are under $700. And are getting cheaper all
the time. The problem is that you are locked into with cheap color graphics
Atari decides to put in the TT because the Atari market is too small for third
party vendors to design Atari specific hardware. So the lousy 640x480x16 color
graphics is ALL you will see for YEARS on the TT. It is a shame that Atari didn't
make the graphics better then that!! The price of monitors is NOT the critical factor
that it used to be. The TT was an opportunity for Atari to LEAP ahead of the
competition in graphics instead falling behind. That
alone says a lot about Atari Management. Make a cheap computer and sell it
to the yokels!! Don't make a State of the Art computer (you can NOT tell me
the TT is forcing the state of the art, not with a single tasking OS, and
crummy graphics).

>
> Price high resolution monitors for the Mac. Note that they require a card.
> Note that the TT/P has a card slot.

Yes, EXACTLY ONE, and that is only a half-VME card slot at that!!

>

>
> A third party could do that... it would sell and probably make money.

Is that your answer for everything?? Wait for third party vendor support of
basic OS features?? Doesn't say much for Atari does it??

Unless Atari Corp supports a GDOS replacement it will NOT be a standard
that software developers will use. Atari HAS to develop and SUPPORT a
GDOS replacement before SW vendors will develop for it. So, a 3rd party
vendor GDOS replacement won't fly. The only reason that GPLUS is viable is
that it is plug replacement for GDOS. If GPLUS's fonts were incompatible with
GDOS fonts GPLUS wouldn't have sold either.

>
> The Mac IIcx and Mac IIci hardly outdate the TT, especially since it seems
> that they cost a lot more money (assuming the TT arrives, of course.)

what does cost have to do with obsolete hw?? Even if the Macs were CHEAPER than
the TT they would still be more ADVANCED then the TT. A cheaper TT is NOT more
advanced than an EXPENSIVE MAC.

> Looks like Atari has a very interesting product, if they do bring out
> Unix for it and ship both in a timely fashion.

Oh come on!! The MacIIci has a 25 MHZ 68030 in it!! The TT will have a 16 MHZ 68030.
Which is outdated before it is even on the shelf!!! Hey if you are looking for a
cheap computer buy a used IBM PC XT. Heck you can buy them for under $500. If you
want a POWERFUL computer, state of the art computer, an expandable computer, then
DON'T buy an Atari!!

Why can't Atari release different models of the TT like Apple does the Mac?? And that's
another complaint. the differences between the Mega ST and the 1040ST are just
cosmetic (a better keyboard, a different cabinet, a blitter chip). But the
differences between the Mac II, MacIIc, MacIIci are MAJOR. Different CPUS,
faster CPUS, different graphics. What will the difference between the TT/Plastic
and the TT/Tower be?? Again cosmetic. The Tower will be in a different cabinet,
but will have the SAME cpu, same graphics, same IO, same everything else. It would
make more sense to make the TT/Tower have a 25Mhz or even 33MHZ 68030 to make it
DIFFERNT from the TT/Plastic. Or to give the TT/Tower higher rez color graphics.
Something more then just more RAM, and a couple of VME slots.

Why can't the TT/Tower be designed to use the FASTEST available 68030??

Why can't the TT/Tower be designed with hi rez color graphics??

That would make the TT/Tower more then just a TT/Plastic in a different
cabinet.
>
> And to repeat: WHY DON'T YOU JUST SHUT UP AND LET THE MARKET DECIDE IF THE
> TT IS A GOOD MACHINE INSTEAD OF FLOODING COMP.SYS.ATARI.ST WITH MESSAGES
> ABOUT SOMETHING YOU'VE NEVER SEEN?

Hey, you are "flooding" the USENET system with your "ProAtari" messages,
so why shouldn't I add my own comments?? Also, UPPERCASE doesn't make your
comments any more correct, they just make you look foolish!!

also, I am just stating what I would like to see in a new Atari computer.
If Atari were to design and MARKET a computer that meets my needs I would
consider it. But, from the Atari product descriptions, the TT/Tower looks to be
just a souped up Game machine to me!! And I don't need to spend $XX thousands
just to play Flight Simulator!!

>

2771. SH 204 Upgrade

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 21:11:39 UTC
From: root@trwrb.UUCP
Message-ID: <212@trwrb.UUCP>
Source record: 247143

I want to upgrade my 20 meg SH 204 harddrive to about 40 meg. I hoped I
could do this by simply replacing the Drive Mechanism, HOWEVER,
my drive mechanism is a Tandom TM362 and I can not find the information I need.
What are by options?

* Should I install a 40 meg Tandom hard drive? Where can I find a 40 meg Tandom?
* Can I install a Seagate drive? Which models? Will I need more parts?
* Can I daisy chain the SH 204? Will I need different software?

I am planing on buying the Spectre GCR and I want to have sufficient harddrive
for the GCR.

Thank You,
Gregory Gibson

2772. The Atari STE

Newsgroup: comp.sys.atari.st
Date: 1989-11-13 21:17:41 UTC
From: daniel@pkmab.se
Message-ID: <2250@pkmab.se>
Source record: 247144

The discussions about the STE being vapourware has been more or less frantic.
Soon we'll all see if it's true.

I have ordered one! (yes, I *know*. You're not interested. But please,
do not flame me! You might be interested in hearing about it's capabilities,
or the lack of them!)

Do anyone have the specifications for the new chips? The I/O-adresses
and so on. Any information would be of great help.
Maybe Atari Corp? :-) What do you say, eh?

I've heard rumours about the STE having 8 stereo 8-bit PCM sound channels.
But now a friend of mine, who has access to one of the developement
machines says it only has ONE stereo 8-bit channel! And that it's
impossible to change the frequency on that channel like on the Amiga. It
is according to him only possible to set fixed freqencies like the
crystal /1, /2, /4, /8 etc.

Is this correct?

I've been promised to get the STE on Thursday or Friday. We'll see then.

>Strikes me that older versions of GFA Basic are in the public domain.

Much as we might like them to be, all past and present version of GFA BASIC are _NOT_ in the public domain. Version 2.0 was published on the January 1989 disk that goes with START magazine, but unless stated otherwise, programs in START are _NOT_ public domain.

This crops up about once or twice a year, and it would probably be wise for people posting such information to make _SURE_ that they have their facts straight, or some poor soul out there is going to have an unpleasant suprise when s/he's accused of "software piracy".

On the other hand, Jim Kent _HAS_ acquired the rights to the last version of what used to be called Aegis Animator, and has released a shareware version under the name AniST. The program was published in the November 1989 issue of START magazine, and was posted to GEnie. I don't know about the other services (CompuServe?...).

Anyway, I wanted to prevent some less-than-correct information from spreading across the network. Now, back to your regularly scheduled "my computer is better..." :-(

> You guys and gals are my last hope! Save me from expensive
>languages and ST BASIC!!!!!ARRRRGH!

If you just want a better BASIC, I'd suggest GFA BASIC. I've never used it, but most people seem to like it well enough (certainly can't get much worse than ST BASIC, eh?). I _believe_ the interpreter is (or was?) public domain? At least, I'd swear I saw a copy of the GFA BASIC interpreter on a STart magazine disk last year...

Your system memory & disk size is probably going to encourage you to use an interpreter (of whatever language), since they tend to be smaller than a compiler for the equivalent language. I can vouch that the OSS Personal Pascal compiler (_VERSION 1_ !) is _barely_ usable on a stock 520ST with one 360K drive. I emphasize _barely_! Useful as a learning tool, at any rate -- you'll be able to keep SMALL programs all on the (copy of the) compiler disk, in fact, and avoid disk-swaps (though a RAM disk makes things less painful -- putting the compiler's temp files on the RAM disk speeds things up a bit, too). The documentation is even pretty good.

As for availability, sorry. I don't know if Optimized Systems Software is still around, and you don't want PPascal 2.0 on that configuration (v2.0 grew a bit) anyway, so I'd suggest finding someone who is selling their copy of v1 (pay no more than $20-$30; it retailed for $79, and commonly sold for under $50) or find a mail-order "firesale". (Sorry, I'd like to keep my copy of v1.0 -- I don't use it anymore, but I'm a pack-rat. ;-)

(Alas, I think you'll soon find yourself straight-jacketed by Pascal's strict type-checking on the ST. Although OSS wrapped a decent interface around a substantial chunk of the GEM/TOS functions, they weren't all there in PPascal. And IMO, it was a real pain to go outside of the OSS-supplied interface when you needed to, largely because of type-checking. They extended the ISO standard in other ways; why they didn't add some sort of type-cast (beyond variant records, which I LOATHED using) is

beyond me.)

All of the other ST compilers I've had occasion to use require either more memory than 512K, or another drive, or a hard-drive, or all three to be useable & relatively pain-free. Really, you may want to shop around for another SS drive at the very least. Or, better yet, upgrade to 1M of memory and use a big RAM disk.

In article <46c13647.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Covert) writes:
>Has anyone else found any errors in the MWC Version 3.0 manual??

As a matter of fact, yes. The 3.0.5 manual claims that the proper way to call objc_edit() is as follows:

```
int objc_edit(tree,object,character,oldindex,kind,newindex);
OBJECT *tree;int object,character,oldindex,kind,*newindex;
```

This is in fact what GEM expects. It is not, however, what the 3.0.5 library expects. The actual call format is:

```
int objc_edit(tree,object,character,index,kind,index);
OBJECT *tree;int object,character,*index,kind;
```

where index serves the function of both oldindex and newindex above.

By the way, what is the most recent version of MWC? I've heard 3.0.9 and I'm somewhat concerned that Mark Williams hasn't notified me. To my knowledge I'm registered (how might one check that?).

I have just finished reading your series of six or so messages bashing
Atari Corporation. I have one point to make:

GIVE IT A REST!!!

I'd say that almost everyone on the net knows of Atari's previous
terrible policies, screwups, lies, etc. It's possible that Atari WILL
put out the TT/STE/ATW. A previous posting on here from has already
said that the ATW _was_ available in Europe. I don't know whether
Atari is going to really do something nice or screw it up again,
but the point is that we already KNOW about the stuff you've posted
about, and we're hoping that it'll turn around.

Speaking of European Software...

Has anyone else used STOS Basic?

I would like to know how it ranks with Hisoft and GFA 3.0...

I just picked it up because I like the COVER of the box...

The package is one of the best I have ever seen to my atari line of computers.... (atari 400 through atari 1040st)

I am also interested in the compiler for STOS basic.. I had it in my hands also, but I decided that I would rather wait and see if the basic was worth it. I am sorry that I did not get it immediately.

Would be nice to have a little truth emanate from the
mouths of ATARI.

Yes, this is another BASH! Does Atari deserve anymore?

This morning I learn from a developer friend of mine
that Atari can't promise him his STacy now until "late December
or early January".. was supposed to be "end of October".

I got to thinking.. well, if they can't even supply their
developers with the dang things... only God knows when/if the
consumer will ever see one.

Call my dealer. Owners are at Comdex for the week. The rep
tells me that they already have prepaid orders for the STacy..
but that ATARI told them not to expect delivery until

------> MARCH or APRIL <--------

The TT isn't even shipping Europe yet...

I know I am a fool. Let's see how many other Atari fans
can admit it.

>
>"Someday, Over the Rainbow"

Tha Amiga and MAC have multitasking OSs even though without VM or protection.
PCs have the desqview (ammong others) system for multitasking DOS
and virual memory (but segmented).
AIX provides full unix and DOS compatibility windows.

Apple just released the buggy TOS 1.4 ...
I am certain there are very good chances
that in less that 8 years from now, TOS will become multitasking. 8-)

From: solenod@dragon.UUCP
Message-ID: <46d203d4.13334@dragon.UUCP>
Source record: 247055

Net-beings:

I am unable to use the Chart features of OPUS 2.2. I would like
to ask for any help or suggestions you might care to send my way.

I followed the instructions given in the installation document,
but did not have any success.

This my setup:

1040 Atari ST, 1 meg, 1 DSDD drive.
TOS: 1.1? (copyrighted 1985).
GDOS Version: 1.1

Disk A:
GDOS.SYS - Directory
ASSIGN.SYS
AUTO - Directory

AUTO directory contains:

GDOS.PRG

GDOS.SYS directory contains:

ATSS10.FNT
ATSS10CG.FNT
ATSS10EP.FNT
ATSS10MF.FNT
ATSS10SP.FNT
LQ800.SYS
META.SYS

ASSIGN.SYS contents:

```
PATH = A:\GDOS.SYS\
; Change A: to drive w/GEMSYS folder
00p screen.sys
; --START OF SCREEN FONTS--
01p screen.sys
02p screen.sys
;-----------------
03p screen.sys ; Med-Rez screen workstation
; SWISS
ATSS10CG.FNT
;-----------------
04p screen.sys ; High-Rez screen workstation
; SWISS
```

```
ATSS10.FNT
; -- START OF PRINTER FONTS --
21 LQ800.SYS
; SWISS
ATSS10SP.FNT
;------------------
31 META.SYS
ATSS10MF.FNT

DISK B:
ASSIGNER.PRG
ATSS10.FNT
ATSS10CG.FNT
DESKJET.INF
EPSON.INF
FONTWID.PRG
INSTALL.DOC
OPUS.CNF
OPUS.PRG
OPUS22.DOC
OPUSCOLR.RSC
OPUSHELP - Directory
OPUSMONO.RSC
OUTCHART.PRG
PRINTDEF.PRG
PRINTER.INF
PRINTDEF.RSC
SMSS10HI.FNT
SPL_LOG.OPS

The procedure that I follow is this:

a) Boot up with disk A. I get the message stating GDOS 1.1 is installed.
b) Double-click on B drive icon, insert disk B. Double click on OPUS.PRG.
c) The program starts loading and asks for disk A to be inserted. I comply.
d) The disk drive comes on and after a few seconds the following message
is displayed:

ERROR LOADING SCREEN FONTS
MAKE SURE THE GEMSYS DISK IS
IN PLACE.

I am given the options to CANCEL or RETRY.

If I choose CANCEL it places me in OPUS but the Chart Menu is
"ghosted". RETRY asks for disk B to be inserted but then places
me in OPUS with the same results.

What am I doing wrong? I would like to get this feature going since
I've sent for OPUS 2.3 .

Please post or e-mail me your suggestions.
```

Thank you,

David Soleno

Yup...

PCDitto has a mouse emulation that emulates a microsoft mouse. This
covers 95% of all mouse driveable sw on an ibm.. (Which is to say, just
about everything that works with a mouse on an IBM...)

In addition, it has an alterante mouse mode which uses the mouse to
send arrow-key keystrokes to the application running and the two mouse
buttons can be preset to send specific keystrokes. This allows using the
ST mouse even with applications that don't normaly allow using a mouse.

> and does it send a break?

There is version 1.60, which I recommend you get if/when you can.
There's a patch program on GEnie (and probably elsewhere) that will
update your 1.52 prg and rsc files into 1.60 files or you can get Antic
to send you the update for not much more than the cost of the disk +
postage...

Even the older versions allowed sending a break (quite easily at that).
Take a look in your manual (on page 50 in the older manuals) in the topic
"Other Features" (which is all of about 15 lines long)...

Sorry, Bob,
I've worked with, sold, and used Amstrads. I wouldn't let my worst enemy
buy one. They are junk.

If you think Atari is only a toy company go to Europe. You will find out
how extensively they are using their 'toys'.

Pete I.

I'm not an Atari loyalist, I just don't like the other expensive junk
in the market. (Amiga is OK, though, emphasis on OK)

>enhanced graphic modes? ....

The JRI 4096 color board was designed specifically to be compatible
with the STE and TT method of handling the extra colors, so the
enhanced color palette can be used on your ST, but only programs
that didn't try to take advantage of the STE hardware scrolling or
the TT extra graphic modes would work if you had only the JRI
board.

Because USENET is a world-wide network, it only makes sense to use
the international standard language: English. If it's good enough
for the UN, air-traffic control, and international radio communications,
it's good enough for USENET. At the very least, if you are going to
post in a language other than English, restrict the distribution to
those areas that are likely to know the language. If you need wider
distribution, use a more common language.

2792. Anti-Atari Bashing Flame (long - sorry)

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 01:41:28 UTC
From: steveg@SAIC.COM
Message-ID: <8911140141.AA02948@NARNIA.SAIC.COM>
Source record: 247064

Sorry to waste the bandwidth but, I can't keep quiet anymore.
I'm sick and tired of all the TT flames and Atari bashing going on.
It solves nothing and probably only serves to scare away anyone
thinking about buying an ST. If you must continue with this practice,
perhaps we can get a comp.sys.atari.st.bash area going. So far
Greg Lindahl has been just about the only voice of reason here, and now
he gets flamed. Shheeesh! (I'm with you Greg!)

I've been an Atari owner since November of 1980 when I got my
trusty Atari 800 (which I just reluctantly sold to finance another
hard drive for my ST). I bought a 1040 in February of '88 and
UPGRADED (my DEALER gave me a trade in allowance) to a Mega 4 with
the Atari Laser this past June. I made a careful decision about what
I was getting for my money. I knew Atari's reputation for support
(or lack thereof), and factored that in. I also knew Atari's
reputation for building solid, quality hardware. I have *NEVER*
had any hardware problems with any of my Atari equipment. I now have
a postscript capable system that can (and does) run ST, Mac, and
IBM software for less than most postscript printers cost. I could
complain it doesn't run at 100MIPS, but that's not what I expected
or paid for.

Seems to me the people bitching at Atari have no one to blame but
themselves for not making a more careful decision before buying. If
the TT isn't what you want, DON'T BUY ONE! Come on, it's like you're
bitching at Ford because they won't sell you a Corvette (a product
they don't make), or because your Escort can't outrun a Ferrari (do
something you should know it can't). Find another manufacturer and
leave us alone. I've gotten what I've wanted/paid for out of every
Atari machine I've owned. This is NOT blind loyalty mind you. I
think there's a WORLD of things Atari management could do to get the
ST more exposure and more widely accepted, but that's not my job.
Historically, Atari has always made neat hardware and botched the
marketing. But as Greg said, they ARE making money selling computers
- maybe not in the U.S., but that just means I'll have European sales
to thank for keeping the company around long enough for me think about
them the next time I'm looking for a computer. And if it's a TT, I
DO have a choice about slots - if I don't want/plan to expand, I can
save a little money with a TT/P (why pay for slots I won't use?). If
I want slots there's the TT/x which costs more, but nothing in life is
free. That sounds right to me. TT/x cost too much? Not quite what
you want? BUY SOMETHING ELSE! Buy a Mac or PC and go bitch in some
other newsgroup!

<*heavy sigh of relief*>

Alternate proposal: How about comp.sys.atari.tech for serious technical discussions and exchanges of information in a civilized manner?

Please send all flames to alt.flames where I'll be happy to ignore them. Constructive criticisms and discussion always welcome.

Ooooh, a very barbed message, but I fell out of my chair when I read
the "over the rainbow" line. <snicker>

Well, this may all be ancient history if Dave Small creates a 68030
board for the ST. I trust his business sense a LOT more than Atari's.
If he produces anything close to the quality of his other projects,
he will make a lot of money (and a lot of disgusted users happy).

I'm glad someone credible picked up the ball that Atari fumbled....sad, but
true...

I have an original 520ST with color monitor, single sided drive,
and color monitor. The computer has not been upgraded. The monitor
is of the original (higher quality) type and works perfectly.
I also have an Okimate 20 color printer with black (and maybe color)
ribbon which works, except that the head needs to be replaced for
about ($30 from Okidata Inc. - it is 24pin thermal transfer).

I wish to trade my system for a 1040ST with a monochrome monitor and disk drivor perhaps an
Amiga 1000-2000 system (i think the st would be preferable).
The reason I want a 1040 is to do word processing with greater memory (i plan
to buy a new printer as well). I settled for a monochrome because i thought
that the value of a color monitor and printer would make the trade fair.

Please respond to ta-kbm@cunixd.columbia.edu or
majmudar@cs.columbia.edu.

I am also willing to consider trading for a XT or AT clone and/or
a reasonable cash offer.

This is really getting tiresome. Richard, don't you have better things to
be doing than wasting your time and hours writing long complaints? Has
anyone mailed you yet, agreeing with your statements? Is there any reason
why all of this screaming derision of Atari must be broadcast all over the
net? If you don't like what you've got, write Atari, don't bother us folks
who are happily using and developing stuff for Atari hardware...

In article <46d16986.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Covert) writes:
>The TT/P is NOT a UNIX workstation, not as it comes Off The Shelf.

>
Sun-2s with 68010s and 1 MB of RAM ran Unix, why can't a 68030 with 2MB?
Answer - no reason. If Atari doesn't release an official option, someone
else will. It'd be trivial.

>Once again you didn't understand my comments. I was talking about upgrading the
>cpu in the TT not comparing cpus speeds between the Intel and the Motorola
>cpus. And it would be nice for Atari to design an upgrade to a faster
>68030. Even if it meant replacing the motherboard the way Apple forces

>And other folks who can't drive both a hard drive and the SLM804 because the
>DMA port won't drive more then one load!!
>
Y'know, for the price they charge for new motherboards, ya might as well get
a new case, keyboard & power supply as part of the deal. Mac pricing is so
ridiculous it really isn't relevant in this regard.

The weak drivers are a real pain, must admit. My Mega-4 won't operate the
floppy drive if my hard drive is plugged in but powered off. My old 1040
never had any problems of this sort. No buffering. Definitely seems like
pinching too many pennies there.

>>

>
>Why can't Atari LEARN from Apple?? I guess Atari will be synonymous with
>CHEAP in the future!!

Pointless. Rip out the guts and jam in new ones. As far as the Mac is
concerned, when you do an upgrade you *have* thrown away your computer
and bought a brand new one, at Apple's prices. THis whole argument is
pointless.

>And just how FAR off in the future is UNIX for the TT?? given the fact
>that the TT/Plastic won't be here in next summer, and the fact that UNIX
>is intended for the TT/Tower, I would say sometime next century :-).
>
Unix is wonderful for many reasons, among which are:
a) it's readily portable
b) it's readily accessible

Don't sweat this issue. It's not worth worrying about. You're screaming about
an OS not being available for a machine that's not available. Doesn't that
seem just a little bit foolish to you?

>Yes, EXACTLY ONE, and that is only a half-VME card slot at that!!
>
So what, so you buy a bus-expansion chassis and throw in however many
bezillion cards your power-hungry little hands can get hold of... (Don't
get me wrong, that's exactly what *I* intend to do... }-)
>
>Is that your answer for everything?? Wait for third party vendor support of
>basic OS features?? Doesn't say much for Atari does it??
>
Computer companies don't live and die on their own. Computers don't stand
alone, particularly not in today's world of networking and interoperability.
Third party solutions are the key to any computer's success. It's tough for
a company to keep ahead in both the hardware and software ends of things
simultaneously. Apple's been trying for a long time, but they've failed
pretty miserably. Look at how dismal MacWrite is. It spreads resources too
thin to have to handle both ends of the system. (In Apple's case, they've
spun off their software group as an independent, called Claris.) It's tough
to do both the hardware and the software right. Look at DEC - they certainly
very popular hardware, but they didn't write Berkeley Unix, the most popular
Vax operating system... Look at DEC again, when they tried to release their
own version of Unix. It's taken them how many tries, to get it close to right?

(Must admit, the current Ultrix stuff is Very Slick...)

>Hey, you are "flooding" the USENET system with your "ProAtari" messages,
>so why shouldn't I add my own comments?? Also, UPPERCASE doesn't make your
>comments any more correct, they just make you look foolish!!
>
For some people's comments it doesn't matter which case they're typed in.
So it goes...

>also, I am just stating what I would like to see in a new Atari computer.
>If Atari were to design and MARKET a computer that meets my needs I would
>consider it. But, from the Atari product descriptions, the TT/Tower looks to be
>just a souped up Game machine to me!! And I don't need to spend $XX thousands
>just to play Flight Simulator!!
>
Tell that to Atari, directly. Doesn't do us or them any good here.

>>
>> >What has happened to Atari Corp??
>>
>> They are making money selling computers.
>
>Yes, but only in EUROPE :-)

So it goes. MSDOS is so deeply entrenched in the US, there's no way that
a technologically superior machine could compete here anyway. That's part
of the problem with this industry, "no one ever got fired for buying IBM."
People are afraid of innovations, and only go for things with the Big Blue
seal of approval. Apple's first foray into the area, the Lisa, was such a
poor piece of engineering the stigma from that has slowed the Mac market
penetration for a long time...

Of course, now may very well be the best time for Atari to hit the scene,
and hit it big, as the DOS world scrambles to define a DOS standard for
"graphical user interfaces" (god what a disgusting phrase...). Now, mainly
because there are no established standards, a newcomer actually has a fair
chance at winning itself a share of the market.

Given that perspective, TOS isn't so bad - the PC world has yet to switch
to OS/2, so they're still looking at single-user single-tasking 24x80
character cell COMMAND.COM prompts. Obviously this market is shaking itself
out pretty quickly though, and Atari may yet miss the boat...

... my opinions, only. and why should I know anything, I live at a University,
not in the real world... }-)

I would hate to reduce your enthousiasm (:-) for Atari Richard
but that would have to be quite a LEAP.
The current most common VGA for 386 PCs is 800x600x16colors.
It won't be more that 5-6 months before 1024x768 color will be THE standard
for 386 systems.
By the time the TT appears...

> > Price high resolution monitors for the Mac. Note that they require a card.
> > Note that the TT/P has a card slot.
>
> Yes, EXACTLY ONE, and that is only a half-VME card slot at that!!

I have seen the NEC Multisync 3D for less than $550.
Its provides 1024x768 interlaced or 800x600 non-interlaced. Color of course.
For the PC a controler (1024x768x16colors) costs less that $220.

2797. shel_read() question

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 04:04:52 UTC
From: saj@chinet.chi.il.us
Message-ID: <1989Nov14.040452.5445@chinet.chi.il.us>
Source record: 247069

It looks from the TOS 1.4 release notes like shel_read() is the answer to the question of how a program can tell what its name is, and which of perhaps several executable files with the same name it was loaded from (that is, its full pathname). Is this so? I get the impression that it wasn't always so good. The documentation I have is sketchy and apparently self-contradictory. Would someone please give an explanation of this function, under whatever versions of TOS are interesting to mention. And if this all should be obvious to the most casual observer, I'm sorry: missing the obvious is a special talent of mine.
Steve J.

It is for the same reasons that OS/2 isn't compatible with dos. If you have ever written in a multitasking operating system while understanding what it really entails, you will just smack your hand on your forehead and yell, "yoi!" when you start to imagine how difficult writing such an operating system would be...

Does anyone know how the hell Macintosh managed to make all their programs work with multidesk (or was multitasking always supported on the Mac? Please don't flame me if this is very common knowledge - my hatred for Apple runs so deep that I haven't even touched one until quite recently...)

anyway, are there any plans for a TOS which will support task switching? That would be a really nice feature to throw in with a TT, and isn't very hard (just takes up disk space or memory space)...

I Assume you haven't heard of Microsoft windows or Desqview for the PCs.
It takes less that $1000 of hardware to multitask DOS using a graphical
environment and virtual memory (of sorts).

Don't forget that the NeXT uses the optical storage disk. That has to slow it down terribly. I know that an 800Mb 28ms drive is available, but it seems kind of silly to have both forms of media in the computer. Especially if the optical drive available is only 550Mb. It would probably be much better if the NeXT were to come with an 800Mb hard drive as the default drive and use the Optical Drive just for removeable storage. An entire Licensed Program Product would be available on one disk then and the ussual UNIX installation and upgrading nightmare would be avoided.

I have one comment and a few questions:

[COMMENT:]

Has anyone seen the <<<<COLOR!>>>> ad on page 14 of the November(?) issue
of _Scientific_American_ for the Portfolio? Two pages even!! Looks nice....
Too bad the ST isn't getting those kinds of advertisements.... :-)
^^^^^^^^^Believe it or not, that was not a bash. :-)

[Question 1:]

Is it just my monitor or do all SM124's start to dim out when there is
very little 'white' on the screen?

[Question 2:]

Where are all these old "29 Oct 89" articles coming from?

OOPS![Another Comment:]

Is there any particular reason why the person known as "BobR" had to
post a s--tload of articles on his dissatisfaction with Atari. Why not append
them all to one posting so I could 'n' them. Let's face it, I'm sick of hearing
about the faults of Atari. Some people are giving me the impression that Sam
and Jack Tramiel bought Atari for tens of millions of dollars just so they
could lose money on it and drive the corporation into the ground. Somehow that
doesn't strike me as reasonable. Surely they realize that they better get their
acts together, or they will lose the U.S. market. They know it. We as users
know it. So please! Enough with the Atari-bashing. It does no one any good.
Besides, this is a news group for Atari enthusiasts, not bashers. If you want
to bash, start a comp.sys.atari.st.bash. How about this one:
comp.sys.atari.st.bitch.and.complain.I.hate.atari..........

[This entire comment is MY OPINION. Please! No flames. They do just about as
much good as Atari bashing!]

XXXXTRa Comment:

How's this for an idea:

Now that East Germany has opened its doors, this may be a great opportunity
to sell more ST's!!!!! :-) :-)

Thanks!

Eric "No flames, please." Hobbs

```
An excellent deal.
for sale: 1) Atari 1040 ST
-1 megabyte memory
-new Tos v1.4 operating system installed
-built in 800k 3.5 drive
-RS232 port, Centronics and MIDI ports
2) Atari SF314 disk drive
-external 800k 3.5in drive
3) Atari SM-124 Monochrome Monitor
-fine dot pitch monitor
-high res,no flicker,paper white SHARP!
4) Avatex 1200HC
-300/1200 baud modem
-Hayes compatible(full)
5) HP Deskjet printer
-excellent printer
-economical, competes with low-end lasers
6) Epson RX-80 9pin dot matrix
-solid, great condition
7) Software (LOTS!!) makes package unbelievable
-Timeworks Desktop Publisher ST
-Timeworks Word Writer ST
-Interlink Telecomm Software
-Word UP! (WYSIWYG WP)
-Easy Draw
-Ton of PD/Shareware(LOTS!)

Will sacrifice total package for 1250 dollars(Non-negotiable), will not separate

Get back to seller at 301-674-8762(Bob Johnson)

In article <89317.044722JJL101@PSUVM.BITNET> JJL101@PSUVM.BITNET (J.J. Lehett) writes:
>
> I am running a 1 meg 520 ST with 2 single sided drives....
>I have a number of TEX files which I wish to view, and the are
>labeled as xxxx.TEX. Can someone explain the necessary programs and
>all that will allow me to do this? I simply want to read these files!
>Anyweays, I have messed with some DVI progs and all...but need
>more explicit info I guess, as I have had no success!

If you just want to read those files on screen, you can do that with your
text editor. xxxxx.TEX -files are pure ASCII text (+ some commands you can
ignore).
If you want to use TeX to greate xxxx.DVI -files, you are in trouble.
1 meg is enough to run TeX but 2 ss drives sounds really bad... I have
ST-TeX on my 20 meg HD and it eats about 6.5 megs. (OK I know I have rather
heavily loaded system but anyway.) In ST-TeX manual it says something like:
"A wizand can make ST-TeX run with a double sided drive" and I would like
to add: "but it will be really painfull".

Things you need to run TeX are:

1) program called TEX.TTP
2) format files like PLAIN.FMT and LPLAIN.FMT (first one is for plain TeX
and the second one is for LaTeX).
3) font files like CMR10.TFM (the number of xxx.TFM files you need depends
on text you have).
4) DVi-dirver (for screen called Previewer).
5) pixel files like CMR10.PK (or CMR10.PXL). PK's are packed so the need
less disk space.

I think all the programs and other files you can find for example from
Terminator archive.

Hope this helps! and GOOD LUCK (You'll need that with those ss drives B-)

Its amazing that a company with such good employees or should I say dedicated
employees can be run by such idiots.. I've worked with John a few times, and
I remember Working hand in hand with Neil Hariss..I was a consultant for Ataris
advertising agency in NY(Messner Vetere Berger and Carey) we produced 4 ATARI
commercials that were all very good...BUt dur
due to upper managements lack of who knows what..they werent aired..it was
amazing..Atari wouldn't give us the equipment to film the commercial! Neil
hadto send me his harddrive so I could use it in the commercial!! And talk
about Cheap?!!!The budget was non existant..Instead of having an Atari rep
work with the add agency (and yes they had a NY sales rep at the time by now
he's probably long gone) they hired me.I was 16 and a users group president..
I was asked questions like:Why is the ST better then the mac..
why cant it do this..can it do this..can you make it do this..etc..
it was probably the worst experience in my life!!Even before I did
the commercials I did some work for atari at 47th st photo in NY where
atari did a major press release for the 1040's...Was I paid for that?No..
of course not..Dont get me wrong I love the ST but the management of the
company is horrible...Probably the best thing atari could do is rename
the company and try to sell its computers under a different name! Due to lack
of sufficient support I'm in the market for an OS2 machine..and IBMS student
discounts place a model 55sx at about 1600 for everything I could dream of..
why should I stick with atari????Give me one reason??
Jeremty
whoops..Jeremy Berger
a really PISSSED Atari owner...
P.S. However after programming a Mac..Why would anyone want a MAC???

2808. Is Atari Going Down for the Count

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 07:26:42 UTC
From: myers@odin.ucsd.edu
Message-ID: <7448@sdcsvax.UCSD.Edu>
Source record: 247080

Yesterday, I went to my favorite local Atari store here in San Diego. Only it wasn't an Atari store anymore. After searching behind all the Commodore Amigas and PC clones I finally found a lonely Mega ST. All Commodores were busily running demo programs. The ST looked like a nice spider motel.

Getting to the point. This used to be an all Atari store -- back when I bought my ST in 1985 -- Which makes me ask the question, "WHAT HAPPENED?"

I like my ST but I am getting worried about the prospect of not having a dealer in town (San Diego is a fairly big town).

How can Atari expect to survive selling a machine that computer sales people have a hard time getting excited about? Unless the STE and the TT come out real soon there isn't going to be any support for Atari computers.

Not Atari bashing -- just commenting nervously...

2810. Re: v08i058: drachen -- Game (mono only) part01/02

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 08:15:55 UTC
From: mboen@nixpbe.UUCP
Message-ID: <622@nixpbe.UUCP>
Source record: 247082

Hello again,

recently I sent in 'Drachen' to Steven and he was kind enough to post it
very promptly. He did put in a remark however, that he didn't know what
it was all about and that the texts were in German. He is perfectly
correct, and therefore here is a translation of that first text screen
you see when you start the program. As an aside: 'Drachen' means dragon
and I'll just use that as from now on. Nearly everything is a direct
translation. For the explanation of the dropdown menus I used the string
as it appears and appended the translation directly below it in
parentheses. The stuff in square brackets are remark by me to clear up
what I thought it might lead to misunderstandings. These remarks are
concluded by my initials.

---- start quote: note that I didn't write this, just translated it -----
Dragon is a game from China, over 2500 years old. 144 pieces are set up
on a board in 5 levels to form a Chinese dragon. The purpose of the game
is to remove all pieces from the board. To achieve this at any time two
identical pieces may be removed, iff there is no other piece on the
lefthand side or the righthand side of either piece on the same level. Easy,
isn't it.

Some further remarks about the pieces themselves. There are 34 types of
pieces and of each type there are 4 pieces. The only exceptions are the
sets of pieces labelled BAM, MUM, ORC and PLUM and SPR, SUM, AUT and WIN.
The pieces from either set are regarded as identical to any other from
that set when removed.

To make the whole thing more interesting, you play against the clock. The
10 best players are recorded in a high score.

And now, some remarks about the Drop-down menus:
'Spielwiederholung' a new time record cannot be set!
(repeat last game)

'zeige Zug' all moves possible at this stage are shown one at
(show next move) a time in random order (this is the only help
allowed).

'Zug zuruecknehmen' this is cheating, so timing is stopped.
(cancel last move)

'Stein wegnehmen' take away any one piece - of course, this is cheating
(remove a piece) too, so timing stops.

'Demo' iff all 144 pieces are still in place the demo
(schnell == fast, langsam == slow) will show the

best way to remove them all.

[The remarks in tiny print: (M.B.)]
This game is public domain and to be copied as often as possible! If you like this game, you can of course show your appreciation by sending in a 10 D-Mark bill [to the address given below. This is about 5 $ (M.B.)] For 20 Marks [10 $ (M.B.)] you can get the source code written in GFA basic [probably with German remarks. BTW, GFA basic is one of the fastest Basics around for the ST. There is now Version 3.0 available with compiler (M.B.)]

[and then there was the address of the author, bordered by side- and front view of the game setup (M.B.)]

Dirk Woitha
Hebbelstr. 11
5630 Remscheid 11
[West Germany, of course (M.B.)]

---- end quote --

So, if you want to send in 10 Marks, do so to the address in the quote (since I DIDN'T write the stuff).

The description of the dropdown menu pertains to the rightmost menu entry only, as far as I can see. BTW, 'Datei' is 'File' and 'Ende' is 'Quit', if you didn't find that out by trial and error already.

To select a piece just move the mouse pointer to int and click the left button once. The piece is inverted upon that and you can go to the corresponding piece with the pointer and click that too. If the pieces match, they disappear. If they don't match, the piece selected first is freed and the piece you clicked last is inverted.

But what am I telling you. Simply play around a bit, look at one or two demos and you'll get the gist of the game fast enough.

So have fun playing.

I am not flaming you, but it IS kommon knowledge. With HARD WORK!
Like the people which wrote OS/2, Microsoft Windows, Desqview ...
Mind you, I am not saying Atari people don't work hard. The contrary.
But they seem to be too few to handle a project of this size.

I guess there are other departments (ie PC compatibles, game machines)
which have more need of Atari's employees.

2814. ST Magazines

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 13:22:15 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Nov14.082809est.57414@ugw.utcs.utoronto.ca>
Source record: 247086

A netter has suggested that there are (were) only 4 ST Magazines left.
He meant, of course, only 4 AMERICAN ST magazines. The American magazines
have never been very good anyway, they seem aimed at a market of
intellectual 3-year-olds (STart is a _little_ better, but not much).
There's a French mag I really like -- it has lots of code samples and
specs, but I have problems with the sexist cartoons in it. ST World
from the UK is not bad, and the UK computer shopper at least used to
have an ST section. Any good foreign book/magazine store should carry
these.

I've glanced at some of the German magazines, and they are very
sophisticated, like the PC or Mac mags over here.

2816. How long is your Atari???

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 13:43:42 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Nov14.085305est.57530@ugw.utcs.utoronto.ca>
Source record: 247088

Atari has problems, and I accept that the OS of the future is Unix with a graphic interface, and not the Mac OS, the Amiga OS, the ST OS, or (thank god for her good grace) MeSsyDOS or OS/2.

Some of the people on this net seem concerned that other people have computers with more impressive numbers than the ST. Oh oh. It's just like the "My car/bank account/penis is bigger than yours" syndrome so common in a certain country famous for its big cars.

Face it, TOS is not going to become anything else. Like the Mac, Amy, and Pretty Cruddy clones, it is bound by a large software base which expects a fairly simple type of operation. If you want more than TOS, buy more than TOS.

But do not leave us in suspense. Come back to the newsgroup some day and tell us how many Mhz/MIPS LONG your new computer is. I promise that we will all feel emasticated/emammicated (after all, women are self-concious about breast size too).

2817. Atari TT Block Diagram

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 13:54:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8911150802.AA02649@ucbvax.Berkeley.EDU>
Source record: 247089

Here is a bit of information extracted from the ST Report
Magazine which sheds some well needed light on the state of the
Atari TT. The spec's have been listed elsewhere, however the
block diagram of the TT inards are very interesting!

> TT - TT/X STR Tech Notes BLOCK DIAGRAM - FUNCTIONS - FEATURES

- 16 Mhz Motorola 68030 full 32 bit microprocessor
- Optional math co-processor MC68881/68882 Floating Point.

- 2 mb or, 4 to 16mb of RAM

- 512 Kb of ROM in 4 1mb chips

- 1.44 Mb 3.5" floppy drive, will handle 2 drives
WD 1772/2793 controller.

- VME bus Eurocard expansion
[TT] - 1 single slot
[TTX] - 5 slots

- ACSI internal bus with external connector for expansion
- SCSI internal bus with external connector for expansion

- Serial ports:

- 2 asynchronous RS-232 ports 68901 MFP
- 2 asynchronous/synchronous RS-232 ports (Appletalk or
PromiseLAN) Zilog 8530 SCC

- Parallel port Yamaha YM-2149

- MIDI in/out ports

- Keyboard port (including mouse and joystick)

- Digital 8 bit stereo sound
- Stereo audio output jack

Monitor output (6 modes): RGB and Monochrome

VGA monitor for colour modes, special monochrome monitor

Video modes:

Resolution Colours Palette
========== ======= =======

320x200 16 4096
320x480 256 4096
640x200 4 4096
640x400 "Duochrome"
640x480 16 4096
1280x960 Monochrome

- Battery backed Time/Date clock and 50 byte RAM
- 145 watt power supply
- Desktop packaging

- Operating systems
- ST TOS - Unix V Release 3.1

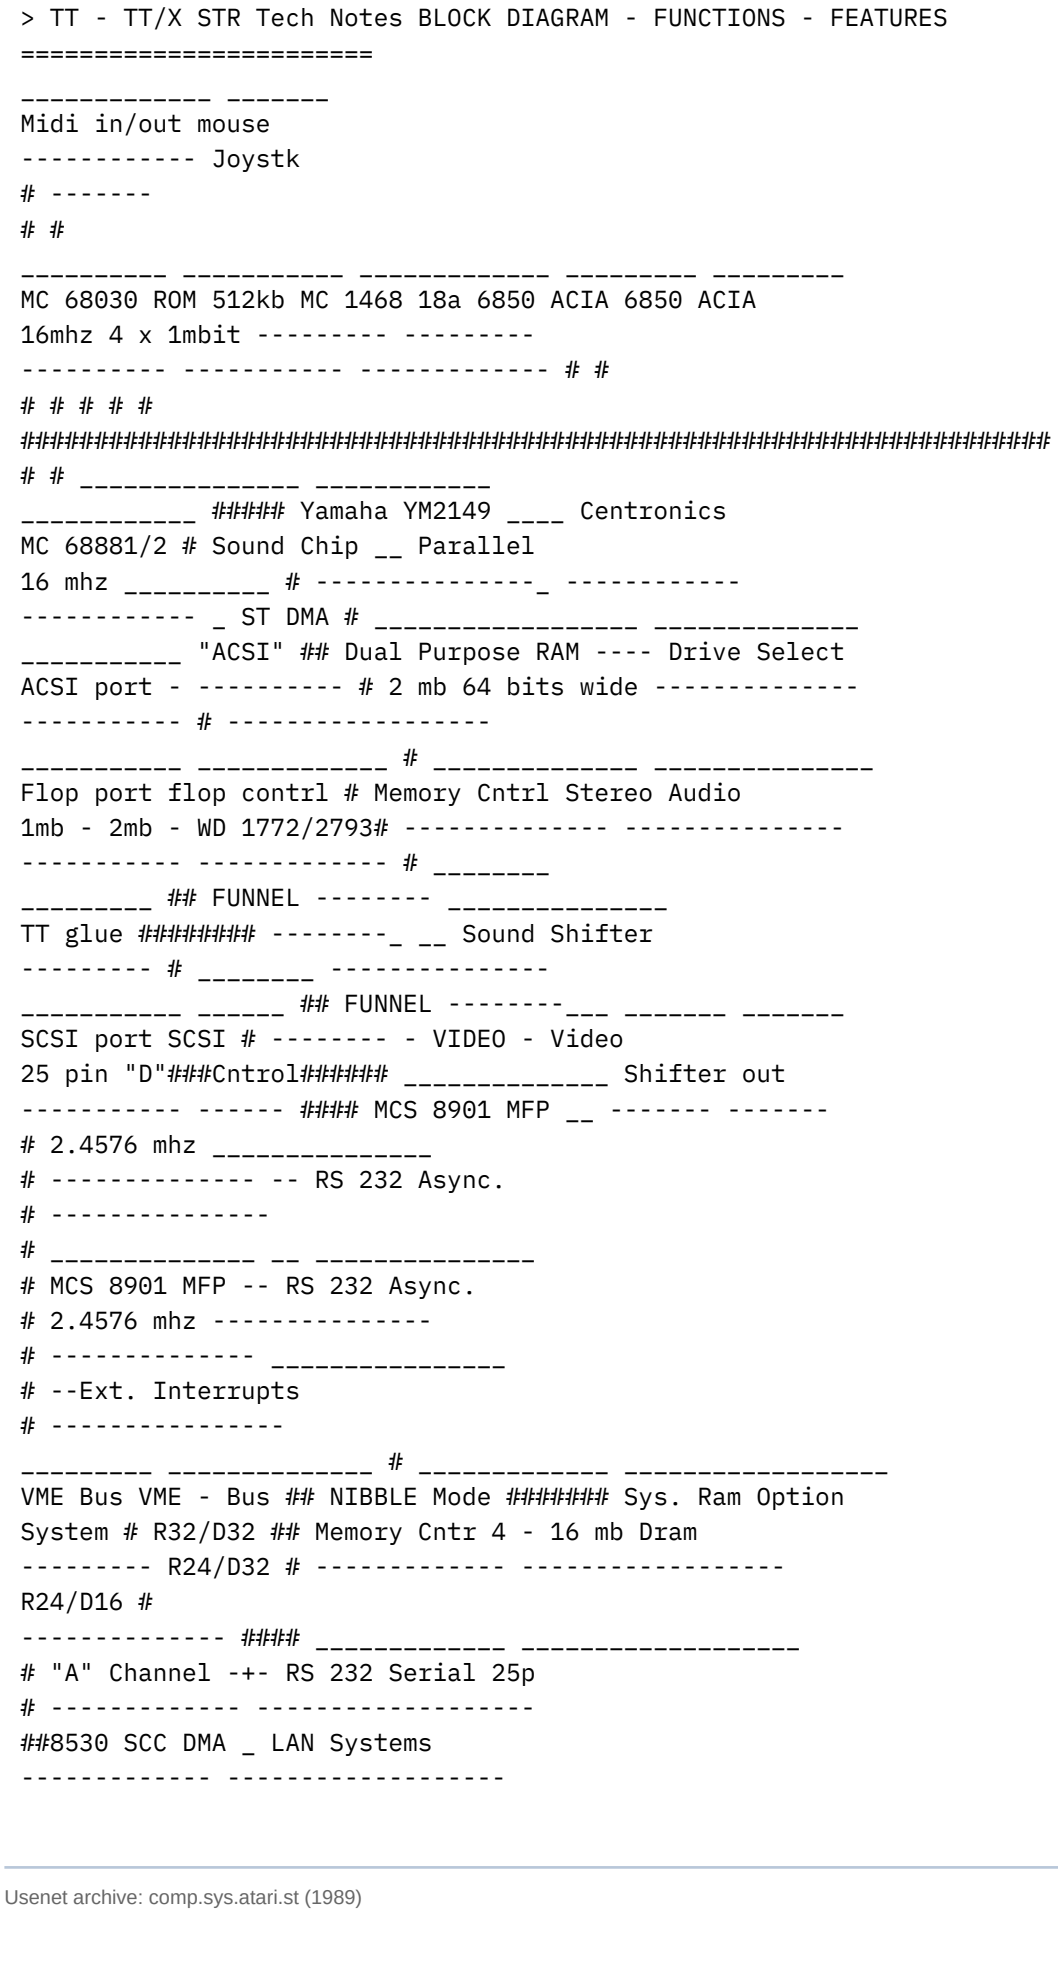
Further, Atari added (verbally) that the co-processor was the 16 Mhz 68881 (just plug in the chip, for the small TT it is included in the TTX), the digital sound was the same as that in the new 1040STE (enhanced 4096 colors etc.), and joystick ports would support current joysticks and the new 15 pin analog joysticks (both machines). Also, expect to hear more about "Demand Paging Memory Management" (Unix), GLS, X-Windows

BAD NEWS:

The monitors will be proprietry as the STs are.(ie NO EASY WAY TO HOOK UP A MULTISYNC) although if you could get a cable/connector it should be easy to setup.

TWO MODELS:
==========

TT
==
- A desktop version in an AT style case w/30mb Hard Disk (limited expandability) 1 VME Bus slot A24/D16 Eurocard
- ABSOLUTELY NO UNIX ON THIS VERSION. This version will be released first.... sometime around the end of October 1989 and mid November.



TTX
===
- A Tower configuration w/60mb Hard Disk, Multiple hard drive - floppy - optical drive bays (3+) Will support both TOS and Unix.

- 5 VME Bus expansion slots; A32/D32 - A24/D16 - A16/D16 Eurocard

- Unix will be a separate release Item (as per STart interview with Sam T.)

- TTX Release dates not set but will be during 1990.

Nota Bene;
To be expected, there will be some unavoidable compatibility problems but, Atari is taking all the neecessary steps to maintain an extremely high level of downward compatibility with existing software.

Being in a rural area where the only Atari products that exist are my ONE Atari ST and a couple of PortFolios at our campus, I appreciate the net here more than most would imagine. This little ST output in the middle of IBMs and Macs is constantly hungering for ST information, hints, and techniques.
And it is this information, hints, and techniques that I wish we could return to. The Atari bashing needs to go elsewhere, folks. Pretty please???? Is there a way that the moderator could step in someway without it being censoring?
There is a wealth of ST information out there: GFA Basic tips, hardware tips, etc., that I think we could all benefit from. It would be marvelous if the net could only return to this.

Time and time again, we see postings about cheap '386 boxes. Yeah, there are lots of cheap '286 boxes out there as well. However, for some reason people keep focussing on the hardware and its price when its the software that determines how good your computer is.

Sure you can get DesqView and Windows for the PC and multitask; but multitask what? A whole mess of unrelated codes, developed without a common interface and with no ability to swap data unless some kind of file importing routine is run.

Try turning a Window based environment loose on a secretary who has a grade 12 education and limited computing skills. How long would it take to train the secretary to use WordPerfect, dBASE and LOTUS and to port information back and forth?

The company I work for standardized on Mass 11 as a word processor, 20/20 as a spreadsheet and ORACLE as the database. Ever hear of Mass 11 and 20/20? Unfortunately I have. Sure ORACLE is powerful but it takes LOTS of training to use it effectively. The same company also promoted PCs as the standard computer for years (before it became VAX crazed). We are stuck with a legacy of LOTUS, WordPerfect and dBASE training courses. The effort and $$$ that have gone into training for PCs and VAX systems is staggering!

The company also has Ataris, Amigas and Macs on site. No training courses are offered AND NONE ARE NEEDED. These user friendly machines, each with its own standard interface for all the software written for it, do not require training support like the PCs do.

Once again netters, YOU do not represent the majority of users in the world. Quite simply, until the PC world finally gets a user interface that truly dominates the market and for which there are lots of software packages that conform to the interface standard (which seems to be happening for Windows) you can take all your '286 and '386 machines and @#%@$#@$%#%$ with them because they just cannot measure up to machines that have standardized interfaces and integrated software that is easy to learn, easy to use and FUN to use.

Go ahead and bash Atari that the TT is not on the streets yet. I would rather wait until hell freezes over than buy a '386 and use the myriad of EXPENSIVE and unrelated PC codes that are out there.

Do not come back and accuse me of not knowing about PC stuff because I am the PC support person in my work group. I have had my fill of getting PC codes to talk to HP LaserJets, of teaching Word

Perfect, and configuring software (What monitor do you have... followed by a list that no beginner has any knowledge of). Just yesterday I was asked to get Grapher to talk to a postscript configured HP LaserJet and because Grapher talks to the user in ITS own way, I had to sift through menus I had never seen before to set up the system. Damn, NO STANDARD INTERFACE AGAIN!!!!!

I also have the pleasure of being a Mac and an Atari support person. Do you know what that involves? Answering questions about new software (have you seen it? is it good?). None of this installation, set up and teaching, teaching and re-teaching crap like PC support involves.

Dear '286 and '386 people; stop pestering us about your FAST machines because in overall productivity your machines just do not cut it. You have already accepted a substandard system; Mac, Atari and Amiga users refuse to do the same.

Disclamer: I have never OWNED a PC (but I have had the unfortunate job of using them for years) and considering the current software state in the PC world I cannot see owning one for a long, long time.

2821. PortFolio as a marketing aid ?

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 15:12:14 UTC
From: jackin@utacs.UTA.FI
Message-ID: <787@utacs.UTA.FI>
Source record: 247093

I think that PortFolio is an easy and profitable way to
make Atari Corp. known in the businessworld.

I overheard a discussion in the HiTech-exhibition few weeks
ago. One (business) man said to the other when the were at
the Atari boot : " See (pointing at the ST with MegaScreen,
which had a complex CAD-drawing on it), there's your games
machine ". They had come to look at the PortFolio and they
saw an Atari ST which didn't look like a games machine.

Now, if Atari is going to enter USA (no more flames please),
Atari has to spend tons of money (real marketing needs it).
PortFolio smoothens this process (and brings money too). I
see it happen also in the UK. Atari UK had recently two full
page ads (in PCW), one of which had PortFolio, the other
Atari PC-range. No ST ads. It looks to me that Atari tries
to shed it's games machine reputation away. Hope it succeeds.

By the way, now that I have read few books of economics, I
understand much better Atari. It's a tough world out there.

MM.

PS. No flames please and please let's stop bashing TT.

Actually, the MAIN reason that I still like my STs (yes, I have two and I still use both of them) is that the GEM interface is still better than anything that I can buy for an IBM PC clone.

I just bought the current issue of the (US) magazine COMPUTER LANGUAGE, November 1989. It dealt with the various multitasking OSes and windowing packages available for the IBM PCs. and it was a very discouraging magazine. It appears that PCs (even 80386 and 80486) are still stumbling around the 640K barrier imposed by the original IBM PC/XT. So, there are few good Graphical User Interfaces available for the IBM PCs. Oh, there are lots of windowing (single tasking, single user) packages,but they are are unique and require learning their library functions. There is NO standard GUI Desktop for IBM PCs similiar to the Mac or GEM.

Now, I need to research the availability of UNIX/X Windows for IBM PCs. COMPUTER LANGAUGE had verry little to say about UNIX; it was strictly MS DOS. If UNIX with X windows are becoming more popular then I will seriously consider buying an IBM PC clone.

I really enjoy the GEM interface. I am writing some programs now with GEM interfaces to them. My biggest problem right now is that I have an early, buggy, version of HiSoft's WERCS (distributed by Michtron in the US). WERCS keeps trashing my HRD file once I develope a BIG RSC file. I have asked Michtron on GEnie (well just last night) about how to upgrade WERCS. I was informed that there is a newer version of WERCS which doesn't crash. My WERCS is version 1.68 Dated October 28 1988.

Anyway, what I want in a computer is SPEED and a Good User Interface. What I expect from a Computer Maker is variety and CHOICE and later Support. And that is was is lacking from Atari.

Rich Covert

2823. Terminator & STZMAG back issues.

I have three questions to ask :

1.
How can I reach NeoCept (or somebody working there) via
email. I hate to use real mail because it takes so long.
And phoning takes 1.3 $ a minute.

2.
Could somebody mail me the demo of using two columns
in WordUp ?

3.
Has somebody used UltraScript with WordUp ? Any comments ?

Thanks,
MM.

Enough about multi-tasking in spite of all obstacles. If you want it on an ST RIGHT NOW, and are willing to put up with some problems, don't ask Atari for it, buy MINIX from Prentice-Hall. It's a bit slow, because of the message-passing design, but it's capable, flexible, affordable and EXTREMELY well-supported (through the newsgroup comp.os.minix). If you need it, it's there. Otherwise, forget about it.

Not public domain. Public domain is a legal term that does not mean what
most computer users seem to think it means.

Antic (the magazine and software publishers) took over distribution of GFA
BASIC about the time GFA 3.0 was released, and disposed of the old version
by making it part of the STart disk.

>Your system memory & disk size is probably going to encourage you to use an

Mark Johnson's shareware C compiler, which is available from the
archive-server@panarthea if you can get it to answer your mail, was
developed on a one-drive 520ST. The C function library is not very
complete, but the GEM bindings are pretty good. It's a reasonable first

compiler for a student.

A second disk drive is well worth the investment, though.

From: hedger@inmet.inmet.com
Message-ID: <30200019@inmet>
Source record: 246902

I have a few more questions....nothing really hard but your help would be
greatly appreciated:

1) Can anyone tell me about desktop.inf ? Can I mess around with it? What
do all of the numbers in it mean? Is there some documentation somewhere?

2) What is GDOS? When does one need it? How does one get it?

3) I am thinking of trying to write a program that will constantly display
a digital time readout on the desktop and update it every minute. I might
even like to do something like a clock 'icon' like on a Sun. Is this even
possible? I don't want to waste my time if it's just a ridiculous
proposition.

4) I am interested in joining a network service. I am interested in programming
the ST, C and MIDI and music stuff. Does anyone have recommendations for
which one to join? I would like one with an ST forum and all that.
Which service do you use? Is it expensive? Tell me what you think.

Thanks again,
keith

Source record: 246904

In article <23991@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>Maybe you're easily satisfied with the three or four Atari magazines that
>are left in the market... unfortunately, you've got to cross ANALOG and
>ST-LOG off your list, since Atari Corp's capricious treatment of the US
>marketplace has forced ANALOG out of business after many years of trying to
>support Atari.

I don't think you can really blame Atari for ANALOG's problems. (I thought someone recently said here that they've simply gone to a "one title, mostly ST-oriented" magazine. I don't think they're dead, are they?) I talked to the people at ANALOG several times when they were based out this'a'way a few years ago, and they seemed rather, well, disinterested in growing or taking any risks at all.

Tom Hudson, who was technical editor at ANALOG for some time, wrote a good deal of DEGAS while there (I was told). I was given the impression that Tom had tried to interest ANALOG in promoting DEGAS. They weren't interested, Tom left, and DEGAS quickly went on to become a best-seller for Batteries Included (who has since folded, true -- but at the time the ST market looked a lot brighter).

The editors at ANALOG also pointed to the START/ANTIC software line with great derision, saying that "people have tried to interest us in this sort of thing, but ANALOG won't do it" (I suppose because of the questionable morality of reviewing your own wares, and I must admit I think START has an abysmal record on that score). Well, laugh -- but I'm sure ANTIC makes money doing so, and promotes their magazine with every software sale. It needn't have been handled as badly at ANALOG.

One day they mentioned that Optimized Systems Software was "shopping around for a buyer for their ST product-line", and had (they said) "contacted us". At the time, Personal Pascal was selling at least middling well. You guessed it -- "not interested".

Who knows -- perhaps they did the prudent thing every time. I suppose it's easy for me to say they should've taken more risks when it wasn't MY $$$ at stake. And none of the magazines can do much about the crappy U.S. ST market, I know. But I can't imagine "getting ahead" without taking a few gambles. They were nice people, but they seemed more interested in going to Star Trek conventions & talking SF than in the future of their magazine. Just my opinion, and based on happenings in the 1986-87 time-frame. I've no idea what ANALOG is doing these days, though I wish them well. I was sad to see them move out of Worcester.

>The point is, magazine publishing is NOT an altruistic profession.. Atari
>Corp is playing with people's lives and livelihoods with their game playing.

>Who can afford to support a company like Atari when it becomes a decision
>between blindly supporting Atari, or eating..?

Well, ANTIC has begun moving into the Amiga market, but I don't see them dropping Atari coverage (don't know whether to :-(or to :-). ANTIC is SOOOOO obscenely gung-ho Atari! that I took everything I read therein with large salt-blocks (the kind farmers put out for their cattle) anyway.
My own favorite U.S. ST magazine (never read any from Europe) was CURRENT NOTES; the "newsletter" from a Virginia-based Atari user's group (WAACE?). Much more objectivity than START/ANTIC/ANALOG, I thought. It wasn't easy to find around here, though.

I wonder; do people revile T.I. for the failure of the 99/4 to grab the home market? Or Exidy for the Sorcerer? Or Kodak for the disc-camera? Someday, I'll bet someone does a thesis of market-psychology with the Atari ST as a case-study...

I think the optical drive holds 256Mb per cartridge, and that the hard-drives
are 600Mb (or perhaps 660?). In any case, I believe NeXT just announced that
it will now put fast 40Mb (non-optical) paging drives on all cubes. In fact,
I believe they're offering the 40Mb drive to current owners at no charge.
This is expected to make a big difference in optical-only system (i.e.: cubes
which don't have the 600Mb drive) performance.

Check out comp.sys.next for the full & accurate scoop.

(I don't own a NeXT. Heck, I've never even SEEN one. I'm just an interested
watcher from the sidelines.)

2837. Re: Atari ST Multitasking/Multiuser OSs

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 17:57:17 UTC
From: don@col.hp.com
Message-ID: <370003@col.hp.com>
Source record: 246909

Here's the gist of the reply I tried to mail to George (which died on our mail server--couldn't figure out how to get to him):
(By the way I'm glad to hear that SOMEONE has had a good experience with MT C-shell and Beckemeyer...it's almost encouraged me to dig it out and try it again, given the amount of money I've invested in it)

I purchased everything that Beckemeyer put out for a while (C-shell, MT C-shell, Micro C tools, RTX, ansiterm, vsh, etc, etc...) and upgraded every time I got a notice of a new version. I spent a lot of money on their products, in general, and my overall impression in the end was unfavorable to the point that I no longer have MT C-shell vsh, ansiterm, etc on my hard disk (I do use some of the utilities from the c toolkit (whatever it was called) with Gulam).

It's been a while, but some of the things I discovered were 1)bad documentation, especially the lousy installation instructions (after installing it and starting multiuser mode, my modem went into permanent off-hook...turns out I wanted to run single user multitasking but they were expecting a login from the rs-232 port and were running a getty, which was in an infinite loop echoing to the modem which was echoing to the getty, which was...this was not documented anywhere, I got lucky and finally figured out how to permanently kill the getty), 2) non-UNIXlike operation (in trying to fix the previous problem, I did an init 1, wanting to go to single user multitasking...unfortunately that was single user single tasking, and things like piping to lp no longer worked! :-(I was not pleased.), 3) generally slow, sluggish feel, 4) a lot of utilities I had come to know and expect in a unix-like environment missing (this was really frustrating, because just about the time I'd convince myself that maybe it could be a useful development environment, I'd try something simple only to find that that feature wasn't implemented), and worst of all, 5) the system kept crashing when I tried to do almost ANYTHING (ESPECIALLY vsh! This was the most frustrating thing and was the point where I gave up and cleaned the stuff off my hard drive--I tossed Ansiterm earlier when it didn't do the binary file transfers it advertised it would, that were the reason I'd purchased it...I even reinstalled it from the floppy and read and followed the directions in the manual :-) and it didn't work!).

My experience (and what I have heard from friends) indicates that if you want a cheap unix-like environment, buy a PC and MKS-Toolkit...this is single tasking but does support pipes, etc, and feels WONDERFULLY like unix! It has vi, awk, grep, etc, etc--all the things you know and love. If you really want multitasking, consider using MINIX (I have friends who are having fun playing with it, personally I have never used it on

an ST so I can't speak from experience here) along with the Free Software Foundation tools--c compiler, flex, bison, emacs, etc.

These are just my opinions and impressions, I'd be interested in hearing what others tell you about their experiences.

Don Allison
don@hp-col.col.hp.com

(One other frustrating thing was that when they announced on-line manual pages, I immediately sent them an order, along with a check. A few months later, they sent me a notice telling me that I could be a beta tester for the man pages, and if I would agree to use them a predefined amount in the next month I could keep them free--this after they had my check!)

And on a different note, I was hoping for something like 24 bit color in the TT! Does anyone know how many planes the ATW has? (I requested some information on the ATW at SIGGRAPH this year, but haven't heard anything yet).

Don Allison
don@hp-col.col.hp.com

As usual, these opinions are strictly my own, and even I disavow them on alternate days!

I bought one memory upgrade from them, and although the hardware works good enough, their service is so unbelievably bad that I feel it is my duty to inform everyone else about it. This is probably the third time I've posted this info, but it's good to make sure everyone new hears it.

> It took over SIX MONTHS (from Dec. '88 to July '89)
> for me to get the cases in working condition, and I STILL DON'T HAVE
> EVERYTHING PROMISED!

This sounds familiar. They have a tendency to delay and delay and delay. I ordered a memory upgrade from them, and after two weeks I still hadn't received it in the mail. So I called them up again, and of course they are too cheap of an outfit to have a 800 line, so inquiring about my late order had to be done at my expense. I wouldn't have minded paying for a call or two, if only they had told me the truth.

Tech Specialties are outright lairs. They told me my upgrade was "in the mail," so I left them alone for another week. But it still didn't arrive, so once again I called. (This is getting expensive, on a starving college student's budget.) They said, more or less, "oops, gee darn, we ran out of parts, and we never shipped your order after all. And, in the time since you ordered, the chip shortage has raised the cost of your order to ...." Great. The guy on the phone was actually angry at ME for wondering what the problem was. They weren't even going to tell me that they wanted more money! Instead they were just waiting for me to call them!

So, t.s. is slow. And, they lie to you to cover up their screw ups. And, worst of all, AFTER I HAD MADE MY PURCHASE AGREEMENT (an oral contract over the phone), they demanded more money!!! They already had one check from me, but wanted another $20 or $30 before they'd ship my order!

Being the young freshman that I was, I stupidly sent them the extra money. I should have talked to some government business agency about them and tried to put them out of business.

Overall, I would stay as far away from Tech Specialties as possible. They are crooks, and their hardware is just average, certainly not worth the seemingly endless nonsense you have to endure to get your order.

From: jmorton@euler.Berkeley.EDU
Message-ID: <19535@pasteur.Berkeley.EDU>
Source record: 246912

Dave Megginson has pointed out to me that Chessmaster 2000 works OK on his system, contrary to the experience of whoever reported that the program bombs when a save is attempted.

As Dave suggests, let's limit the reports of failure to cases in which TOS 1.4 is in ROM and there are no auto folder programs in place.

Please speak up if you find errors in the incompatibility list.

In Info-Atari16 digest #368 Greg Csullog says :-

>Apparently DRI is going to release a multitasking GEM for '386 machines.
>Atari ported GEM for 8088s to the 68000, can it port GEM OS/386 to the
>68030

DRI already has a multitasking version of GEM (GEM/XM) that will even
run (though very slowly) on 8088 machines. It handles the actual multitasking
quite effectively. It's doesn't take an ideal approach to the user interface
Even though GEM programs can run in the background you can't have windows
from more than one task on the screen at once. You must switch to the
background task using the Desktop menu. Context switching is only carried
out when certain GEM calls are used (a bit like Desk accessories really).
I'm not sure if it multitasked DOS (non-reentrant) or if they used
their own DOS-Plus/Concurrent DOS (pretty like DOS except that they are
re-entrant)
It will even dynamically swap programs in and out of memory as required.
It was a bit of a flop as a product so hopefully this new 386 version will
be much better, and that Atari or perhaps some 3rd party (don't laugh - there
is a third party implementation of GEM version 2.0 for the ST, by a Dutch compa
ny I think), will port it for the ST/TT.

>Sam Tramiel, President of Atari Corp promised, on a TV show called something
>like "the Computer Show" that all STs would have a blitter upgrade made
>available... something like a year later, Atari finally admitted the lie,
>and made the excuse that the FCC wouldn't let them do it...

I'm getting really disgusted with the endless stream of message like
this one appearing in this group. I've seen hardly a single message
with anything like technical content, tips, hints, programming help,
etc. Perhaps it's time to creat comp.sys.atari.gripes or
comp.sys.atari.flames...

There is quite a long way between a company stating an intention to
(attempt to) provide something, and an actual product offering. If
you've any experience in the Real World (tm), Mr. Retelle, you'd know
that in this imperfect world we must work in, sometimes things prove
technically infeasable.

Sam Tramiel isn't an engineer. The only thing he could be faulted for
is making a statement before checking with his technical people about
its feasability. Even then, he might have been told it was
technically possible, but his engineers didn't think of the FCC
certification issue. Atari isn't the first, and won't be the last
corporation to have sales or marketing promise something that
engineering couldn't deliver for reasons that didn't become evident
until later.

The 520 and 1040 case designs are very RF-leaky. It was because of
this that they were sold in the US without the RF modulator: they
simply couldn't pass the FCC Certification test with a modulator. My
understanding is that the 1040 is very close to violating the
emissions standard. Adding a blitter to the design would require
re-certification, and would not pass. It is not surprising to anyone
with a little bit of electronics knowledge that retrofitting another
processor into a design may cause that design to exceed some parameter
like RF emissions.

Atari addressed this problem when they designed the Mega STs. The sealed case design allows much better control of RF emissions than does the vented design of the 520's and 1040's. The Megas are FCC certified with 4 megabytes of RAM, and with blitters. If you want a blitter, Mr. Retelle, buy a Mega ST, which were engineered with them in mind.

Is it just me, or are others in this group tired of reading postings that sound like little children throwing tantrums because mommy didn't give the toy she promised? "But you SAAAAAID I could have it! You PROMMMISED! Waaaah!"

Grow up, will you?

>I Assume you haven't heard of Microsoft windows or Desqview for the PCs.
>It takes less that $1000 of hardware to multitask DOS using a graphical
>environment and virtual memory (of sorts).
Desqview has about the same amount of support that CP/M does. Doesn't
count.
And Microsoft is saying that Windows 3.0 (the Wowzer-Bang Gee-Wiz Update
That Will Make Windows Really Neat And Worth Using) will break all current
Windows applications. No, I'm not making this up. Software will break.
FIXING it will be semi-trivial - but try explaining that to all the people
who purchased Windows applications expecting them to work from version to
version.
Personally, if Microsoft really does release an incompatible version
of Windows, I think that'll kill the market. (This is also why WordPerfect
has not been doing anything about Windows, I understand; I'm told they found
out about it already and decided just to wait for Windows 3 than waste their
time on software that'll be de facto dead in six months to a year.)
So very, very happy I don't own a Clone,

2847. Re: TOS 1.4 Incompatibility List Request

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 20:00:03 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440079@hplsla.HP.COM>
Source record: 246919

I guess I have an entry for the TOS 1.4 incompatibility list - Turtle 3.0!
There seems to be a problem creating and deleting folders in TRAMDISK (as
reported by TTLEXEC). I have tried the newest TRAMDISK from GENIE and
it doesn't work either.

Now, I'm seeking suggestions for a good back up program! Anybody know about
Codehead's FASTBACK?

%%%

2848. Various topics

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 20:04:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8911150804.AA02844@ucbvax.Berkeley.EDU>
Source record: 246920

REPLIES TO VARIOUS SUBJECTS:

1). From "Bob Marley" (address given as BAILEYS%.... in digest no
625- RE: Tech Specialties Catalog.

I had a bad experience with Tech Specialties on a disk drive kit.
Colleagues of mine have had bad experiences with deleiveries of
"Tower cases". I would not buy anything from them. Some maga-
zines no longer accept their advertising.
They failed to deliver their products in a timely manner and then
failed to support them once delivered.

2). To "Marty" with the boot problem - The symptoms you describe almost
always go away when you replace a defective .ACC file with a good
copy. You may also be experiencing marginal reading ability from
your disc drive. Strip away all .ACC's and start over. Autoboots
can also cause this problem. Strip them out and reload them
on at a time until you find the one that causes the problem. Also
make sure that your machine has been turned off long enough to clear
RAM.

3) Request for Uniterm on Disc - Get hold of a copy of Current Notes
Magazine from your local store. Uniterm is in their PD library.
If it is not listed in the latest issue just check with the
publisher at the address given in the magazine. I think the disk
number is around 302.

4). To Mustafa Thamer: There are a couple of decent command shells.
The one I use most often is DO_IT! from QMI. In the PD world
there is GULAM (look for it in the NET World) for those who
insist on unix-like obscurity. There are a couple of simpler
ones like PCOMMAND available from Current Notes.

2849. A list of suggestions to Atari Computers.

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 20:31:27 UTC
From: phoenix@ms.uky.edu
Message-ID: <13239@s.ms.uky.edu>
Source record: 246921

This is just a list I felt like putting together of steps Atari could take, I think reasonably cheaply (at least the higher-priority suggestions), to win back a lot of friends. Please skip if you're not interested.

The Atari Suggesion List - V1 and only.

1) Official upgrade paths which do _not_ consist of "buy a new machine." Even on things like the 520ST. I'm not talking about new graphics modes, but I _do_ demand things like official RAM upgrade paths.
2) Customer Support. By this I mean several things: TOS upgrades at cost. Acknowledgement of bugs in the system, and sincere attempts to repair them. Improvements in GEM. Things like that.
Basically, you can get your owner base to advertise for you, if they believe in the machine and the company. You've had loyalty; reinforce it, and use it to generate sales.
3) Dealer Support. The only Atari ST dealer here has no machines out right now. He's waiting for the STE, and getting annoyed with it. He used to love the ST. Now he seems to use Amigas for everything. Friends of mine in Conneticut say they've never even _seen_ an Atari ST dealer.
4) Hardware Support. Get your third-party developers working again, too. Get a development machine in as many hands as you can. Yes, it costs, but yes, it can pay off, if you convince them that you're really interested in your own machines. Right now, word on the street that _I_ get is that Atari intends to become a clone manufacturer. That may have nothing to do with reality, but it _is_ the perception I'm picking up.
4a) Hardware fixes for the ST and Mega to use multiple resolution modes on the same monitor. Bi-sync monitors are not _that_ expensive to make, and you should _not_ have to reboot to change modes. (This is high on my "my, how goofy" list. This also turns a _lot_ of people off).
5) Software Support. Fix the operating system, and support developers. Stop insulting them with photocopies of manuals packaged into old Atari 800 boxes. If they don't programme for your machine, you don't sell machines.
Take care of all these things first. THEN:
1) Once you've patched things over with your developers, start nudging them in the way of new and better applications. Strong-arm them into obeying the operating system rules (which will lead to a following suggestion)...
2) Now that you've got a solid system: advertise, advertise, advertise. The system will now not actively turn people off through its deficiencies, and you've only got to let them know about it.
3) SHIP a working high-end machine. It doesn't have to be cheap; it just has to be there. Even if nobody buys it at first, it should be available so that people know "there's a future with Atari. They are looking ahead." Also, don't announce shipping dates unless you _know_ you can meet them. Saying that you're working on something and that it'll look like X is great; but do _not_ say it will be in the stores on day M when you're not sure it

will be.
4) Longer-term plan: multitasking TOS. Even "co-operative" tasking OS would be alright (if Apple can do it, so can you guys.) It should be possible to come out with a version of TOS wherein all well-behaved programmes will run in a co-operative multi-switching environment, and if you've been pushing people, it won't be your fault that the programme breaks. (Leave a single tasking mode, of course, for those programmes which DO break. That way, all bases will be covered, and users can - justifiably - get annoyed at the software makers.)
5) Longer-term plan: higher-level graphics standards. Right now, Atari is not at too bad a level. Count the number of Monochrome Display Adaptors still running and see if you don't believe me; or, look at the number of 16-color 640*200 displays Tandy ships to the home users. Despite the press, most Cloners do _not_ own VGA systems and multisyncs, and Atari's monochrome resolution is higher than that of any Mac below the II level.
Anyway; enough of this; it's too long already. I know it's a big list and would take a lot of money to implement, but it would be nice to see it happen.
Please route flames to /dev/null.
- R'ykandar.

>It would have helped if you had included the code that was doing the
>modifications. The 68000 does instruction prefetch.

Yeah, and (as Eric points out) on a TT it will get you in BIG TROUBLE.
Writing to something as data and reading it as code is a BIG NO-NO
unless you invalidate the cache in between. In fact, on the 68030,
writing something in User mode and reading it in Super mode would
confuse the cache, were it not for a side effect of the write-allocate
bit.

People who do DMA into memory have to worry about that - the BIOS
tries to help, but you can still get in trouble. Your DMA driver
should execute the following instructions to clobber the cache
after a DMA read and before anybody actually looks at the data:

```
movec.l cacr,d0 ; get current cache control register value
or.w #$808,d0 ; set both "clear" bits
movec.l d0,cacr ; write this new value back
```

The clear bits in the cacr are one-shots, so you don't have to clear
them again. The code above is harmless if the cache isn't enabled in
the first place, as it doesn't change the enable or other state bits.

The TT is going to open a whole new can of worms, people. We've been
dealing with it internally, of course, and TOS runs fine, but there are
things which you could get away with on the ST which you can't do on
the TT. For example, some programs use the high byte of a pointer for
something; with a 24-bit address bus, that's harmless. But with a full
32-bit bus, that gets you in trouble.

Just wanted to let you know that Analog/stlog is not going to publish after
the december issue, they have decided to cease publication, it really is to bad
as the new dual format was done nicely

2853. ST Mouse

Newsgroup: comp.sys.atari.st
Date: 1989-11-14 22:02:18 UTC
From: dcs60222@zach.fit.edu
Message-ID: <684@winnie.fit.edu>
Source record: 246925

My ST mouse recently bit the big one and I have been investagating
the idea of investing in a higher quality version. The question is
"Is there third-party support for higher quality ST compatable mouses
(or is that mice? :-)" or am I stuck with the, Icheap Atari version.

Also, I would appreciate a company name or a mail order house name
which could supply me with this. I went to my local (in fact only)
ST shop and they wanted $50 for a replacement! I havn't yet looked
in catalogs or mags, so I don't know if this is reasonable.

advTHANKSance,

Mark Enriquez

I believe you mean support for using Desqview as a multiprocessing OS.
And you are right, it is not easy to use Desqview
as a multiprosessing OS (even though possible and documented).

However, I was refering to Desqview as a way to execute many DOS programs
at the same time. For that, you need 0 support.

>
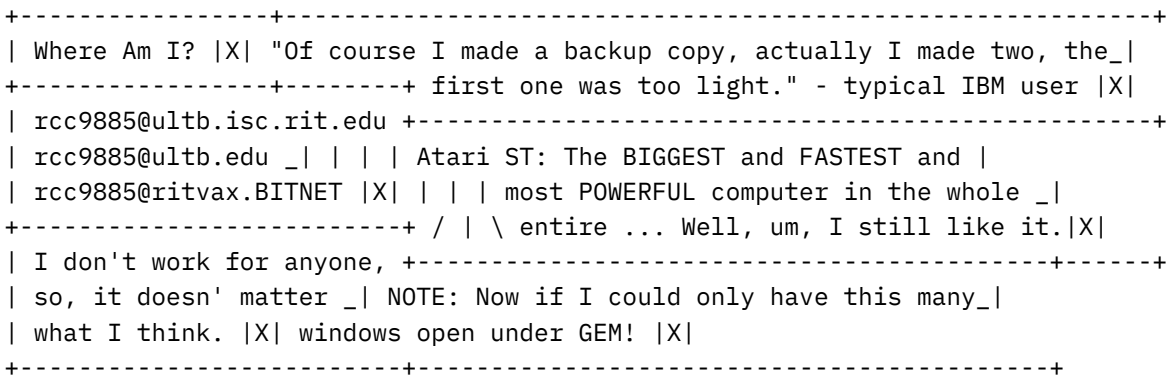
This isn't true. Last weekend I was bored, so a couple of friends and I drove up to Toronto, Canada (from Rochester, NY) to go to the Ontario Science Center. To our surprise, they were having somekind of midi demonstration going on, and many local computer dealers were there. Two different Atari dealers HAD PRODUCTION STaceys and told us we would be able to have one by the end of the year (this included all the back orders). I used one for about an hour, and this is a truely amazing machine. The backlit LCD is perfect, and I like the trackball/mouse more than the ST mouse. The keyboard is BETTER than the Mega's keyboard, and when I get all my Christmas money, I will be selling my Mega!!! They were offering a STacey 4 (that's a 4 meg STacey with a 40 meg HD) for $2200. NO ONE can tell me this product isn't real, I've used it, and I LIKE IT! (And I'm not even anyone important!)

Anyways, I really think ALOT of people are getting all excited about nothing. I really think Atari has changed for the better, and maybe the days of vaporware are over! I know I have already ordered my LYNX from the Sears Catalog, it will be here December 1st! Now all I have to do is decide if I want a TT/p or a STacey!!!



I've had an Apple once (and even worked for a dealer), never again. I use MeSsy DOS a work (on a 386 no less), no thanks, I'll pass. The Amiga is nice, but I really don't have any complaint's about my ST. It's probably got the most computer literate userbase (although this may not be from choice :))

If you have a complaint/question about the ST, maybe you should try asking someone NICELY. There are several people from Atari who read the net, and I have yet to see them atleast try and answer someones HONEST question. I know I appreciate this service (Thanks guys, your great!) and I bet they would even be MORE helpful if they felt a little more appreciated! So

lets have some informative conversation (yeah, like this one!), my
w key hasn't been used in quite a while!!!

Thanks!

Ooooh, a very barbed message, but I fell out of my chair when I read
the "over the rainbow" line. <snicker>

Well, this may all be ancient history if Dave Small creates a 68030
board for the ST. I trust his business sense a LOT more than Atari's.
If he produces anything close to the quality of his other projects,
he will make a lot of money (and a lot of disgusted users happy).

I'm glad someone credible picked up the ball that Atari fumbled....sad, but
true...

[Dave Small's blurb about this maybe-030 upgrade for the ST...]

> We will also "clock" the 68030 processor at a much higher speed
> than the ST's 68000. The ST runs at 8 mhz (millions instructions /
> second); we'll go for at least 16 Mhz and possibly more.

This is wrong. The ST has a clock rate of 8 mhz. But it takes 4 cycles
for the processor to fetch a word from memory, and so memory is really
available only 2 million times a second. Then access is interleaved
between video/refresh and the CPU, so the CPU gets 1 million per second.
Gosh, I don't really remember anymore. Anyway, it isn't 8 million
instructions per second.

Message-ID: <891115.01380008.047991@CU.CP6>
Source record: 246941

May I respectfully suggest that BobR and Richard Con are
so absolutely right that we just close off this conversation
about whether TTs will never match 386s and whether Apples
are 9 or 10 Mhz faster than STEs, etc. Bob and dick, youu
are absolutely right, we all admit it, so now please
port all your future messages to the IBM and Mac boards
andyou will be praised to the skies. Thank you. End
of conversation.
Now the rest of us who (like me) have had 1040Sts for
three years and found them faster, cheaper, more reliable
and more useful than any other machine including the
Idiot-Brained-Monsters we have to use at work should perhaps
use this forum to help each other with useful information and
hints about how to do even better.
Her's my contribution-- someone was asking for information
about a database program that used "Make One" and "use one"
instructions. This is either Base Two, a commercial and very
good GEM-based database that I use and like, or its predecessor,
which I believe was called dbOne. It was given away along
with
with First Word by Atari in the early days and is not as powerful
as the later, upgraded, Base Two, but base Two uses its files.
I'd recommend using Base Two, but the first one is quite acceptable.
It is quite easy to use-- the Make one Creates the dabatase
fields and forms, the Use one is to insert the data. Manuals
should still be available. But I'd buy Base Two and be done
with it.
Word processors: I have seen ads in a British magazine
for what appears to be an upgraded version of Word Writer, which
is, as you know, written by GST in Britain (same ppl who did
First Word and First Word Plus). If anyone from Timeworks
is on this system, can they say if Timeworks plans any upgrade
that is similar? I have WW 2.01 (which is, I think the latest)
and I like it, but would love to have it enhanced to meet
the competition from Word Up or First Word Plus. Anyone hear
any details?

They say I am a miser but I do not buy that-- old Slovak proverb

[An amazingly incoherant and long posting.]

Richard:

My advice to you is this:

1) Wait until the TT is released. If it isn't, go buy something else.
2) Evaluate the TT. If it meets your needs, buy one.
If it doesn't, don't.

Repeating what *you* want a million times won't get the message to Atari,
it will merely bore us. Speculating about the TT's price/performance
before it exists is silly. Flaming about the TT's price/nonperformance
or obselescence is equally silly.

Have a nice day.

>OS/2 386 will allow any number of DOS compatibility windows within OS/2.

Actually, these compatibility boxes aren't fully compatible. Among
other things, they drop fast interrupts. And since most applications
using the serial port have their own drivers instead of using the
BIOS drivers, this is a big problem.

The compatibility box also has a big advantage that comes from an
earlier limitation. A PC expects to have 640k of memory. An ST can
have up to 4 megs. So if your single-tasking program is making the
stupid assumption that nobody else can allocate memory... OS/2 can fix
it by giving it the full 640k, while a multitasking TOS can't.

Remember Juggler on the Mac? It had an interesting solution to the
problem, but you had to give it a hint of how much memory to
tell each program it had.

>>Does anyone know how the hell Macintosh managed to make all their programs
>>work with multidesk (or was multitasking always supported on the Mac?

>I am not flaming you, but it IS kommon knowledge. With HARD WORK!

Actually, they did it be slowly changing and adding to the "rules"
for writing applications. Haven't you noticed the occasional screams
when a new release of the Mac OS breaks existing programs from big-name
software houses? However, most Mac programs have good support and the
companies immediately go out and fix them. If Atari produced a
multitasking system that required a bunch of litle changes to almost
all programs, how much chaos would result?

Whew... I've been learning a lot about the way Amstrad is perceived in the U.K. and Europe...

Here in the U.S., Amstrad computers seem to be among the "second line" of third-party machines, along with names like Blue Chip and Packard Bell... we don't have Amstrad stereos and other things.

Since the original question came from the U.K., I'll have to defer to the experience of those in that marketplace... I think my point was clear though, even if the comparison with Amstrad was flawed...

2876. GDOS - basic information wanted

Newsgroup: comp.sys.atari.st
Date: 1989-11-15 08:03:24 UTC
From: VCD51661@DS0RUS54.BITNET
Message-ID: <8911141500.AA10674@jade.berkeley.edu>
Source record: 246948

Hello, out there in netland!

From time to time the same question seems to appear on the net:
What is GDOS, and more important: How can i use it? Did i miss
the answer? As i once bought GDOS myself but have no luck in
using it (it came with almost no documentation) i want to post
the question again. More specific:

1.) What does GDOS consist of? It is, as far as i know, a
supplement to TOS/GEM. Which functions belong to it? Is
it just some environment/kernel for device drivers, or do
drivers belong to it?
2.) What is the general format of the assign.sys file (which
seems to be some startup information file)? Are there other
files needed (except for font files)?
3.) How do i use the GEM Metafile device? Can i, e.g., open a
virtual workstation with a metafile as device, and do all
kinds of VDI operations on it, and then - somehow and some=
where - a metafile is produced? And how can i use this meta-
file later? Where do i get a metafile driver, if it isn't
part of gdos itself?
4.) How can one write own drivers, i.e. what specifications
has a driver to fulfil?

This is a catalog of questions. The answer would be a handbook
on GDOS, i guess. I suspect that no one would like to answer
in full detail, even if he/she knows. However, every information
is welcome. Maybe some literature hint, if any. Documents in
the style of Allan Pratt's "Pexec cookbook" or Tim Oren's "Pro-
fessional GEM" would be perfect, but i doubt that such a document
on GDOS exists.

Again, every hint is welcome.

>bought Atari for tens of millions of dollars just so they could lose
>money on it and drive the corporation into the ground. Somehow that
>doesn't strike me as reasonable.

Er... read up on your Atari Inc/Atari Corp history... Jack Tramiel obtained control of the Atari company with VERY LITTLE cash outlay... essentially he took over control of a bankrupt division of Warner Communications and sold off the existing warehouse stock at a fraction of its list price value to raise cash... he then used that cash to finance the debut of the ST onto the marketplace. When the ST appeared to be going places, he went "public" and sold stock in the Corp and used the proceeds to pay off outstanding debts...

Jack has since "retired" and let his sons run Atari Corp... with the results that we see today...

(I won't reiterate those ramifications in deference to those who would rather think everything is just rosy in the Atari world...)

Bottom Line: "Sam and Jack" *NEVER* paid "tens of millions" for Atari, and nothing they've done strikes me as "reasonable"...

Sorry to post this here. I have made 3 attempts to mail Gert and all have failed.

Gert,
Thanks for the offer of the 6809 Emulator. I have no intention of using it for comercial purposes. Myself and a friend currently use home built 6809 machines running FLEX. We are both considering replacing thses with ST's but would like to still be able to run some of our old 6809 software from time to time. I would therfore like permission to make one copy for him!!. How would you like to send the software and what sort of money do you want for your efforts??.
Dave.
P.S. We use out 09's mostly for things related to Ham Radio, (oh and I wrote some games for my kids.)

There must be more to this than TOS 1.4. I have been using 3.0 with TOS 1.4
for several months, without so much as a hiccup.

Incidentally, the new RAMdisk on GEnie is aimed at a single specific
problem, which occurs with version 4.0 and higher of ICD's disk driver.
It has no impact on anything else. It is backward compatible with all
other systems.

But in another article writes:

> Please take the ads somewhere else...

Yes, but isn't advertisement from small companies valuable information
in this newsgroup. I was looking for Blitz for 1 month but wasn't able
to locate it, and this "Ad" (which contained the way to build the cable
by oneself) was a very valuable piece of information. Aren't you asking for
a kind of an ad with your first question?

"Ads" for the TT, STe, Tos 1.4, Spectre... have been posted here for
some time now :-)

Be tolerant to small buisness on the ST... it benefits the user.

2882. sizeof(int) on 16-bit Atari ST.

Newsgroup: comp.sys.atari.st
Date: 1989-11-15 14:49:15 UTC
From: rbutterworth@watmath.waterloo.edu
Message-ID: <31505@watmath.waterloo.edu>
Source record: 247004
Cross-posted to: comp.lang.c,comp.sys.atari.st

Thanks to everyone that replied to my question about sizeof(int),
both in news articles and by mail.

I wanted to know if there were any reasons,
other than making it easier to compile non-portable code,
for having sizeof(int)==sizeof(long) on the 16-bit Atari ST.

No one could come up with any other reason
(although maybe some think they did :-).

Below are excerpts from most of the responses.
If yours isn't there, it only means that I didn't disagree
with what you said.

If anyone disagrees with my comments below,
it is probably best to continue by mail or follow up to group
comp.lang.c since this topic is now about C programming and
not directly related to the ST.

> of 00 03. To get around that, pass your constants as (short)3 instead.

No. For "func(int x)", or if there is no prototype in scope,
"func((short)3)" will convert 3 to a short, and then convert that
short back to an int before putting it on the stack.

The same thing will happen with non-constants too.
"func((short)x)", if x is type char, short, or int, will convert the
value of x to a short, and then convert this possibly truncated value
back to an int before putting it on the stack.

> Of course if you haven't written your program yet, just write stuff to
> use shorts instead of ints.

I use shorts when I want shorts, longs when I want longs,
and ints when I don't care which I get.
That is what ints are supposed to be for.
So that if it doesn't matter whether it is long or short

the compiler will use the most efficient type.

^
at least
> If you just declare int, the size is implementation dependent.
Correct.

The rule is chars are at least 8 bits, shorts are at least 16 bits,
longs are at least 32 bits, and
sizeof(char) <= sizeof(short) <= sizeof(int) <= sizeof(long).

Note that I sometimes use a machine that has 36-bit shorts
since the code to access 2-byte objects is very inefficient
and not worth implementing since most programs ask for shorts
for the wrong reason (i.e. except for explicitly non-portable
code, shorts should only be used in very large arrays).

> You're right that a 16 bit int makes more sense in a 16 bit architecture,
> but DO NOT depend on all compilers to do it that way!

I don't.
I rely on ints being at least as big as shorts and hope that the
compiler will give me the appropriate size for the current architecture.
For many ST C compilers, it doesn't. This makes the program a little
slower, but since I write portable code it still works fine.

====

> From: apratt@atari.UUCP (Allan Pratt)

Sorry. It is certainly a valid reason if one is faced with having
to compile non-portable code. When I said "not valid", I meant not
valid with respect to my question. I was simply asking if anyone knew
of any *other* possible reasons. So far, no one has come up with one.

> Personally, I consider "int" to
> be an evil data type when the issue of portability comes up.

Funny. Personally I consider "int" to be the best thing for portability.
If fact that is its sole reason for existing.
If you don't use "int" for portability, what do you use it for?

One should only use int in cases where it doesn't matter whether
the compiler generates code for long, short, or something in between.
What is wrong with int is the way so many programmers have misused it.

> But look
> at UNIX and all the libraries meant to look like UNIX: malloc, fwrite,

> write more than 32K at a time. Thanks. MWC suffers from this, as does
> Alcyon and some Mac-derived compilers (but for a different reason).

True, but the ANSI standard version of C fixes all or most of these problems.
That's why I'm using GNU C instead of one of the older non-standard compilers.

> which breaks code such as "p = (foo *)malloc(sizeof(foo))" because malloc()
> doesn't expect a long argument).

That problem will go away in general as more compilers
conform to the standard.

If minix is using the GNU compiler and the GNU library,
there shouldn't be any problem. Under ANSI C, malloc()'s argument
is supposed to be type (size_t), which is the same type as the result
returned by sizeof. For an ST, this is probably typedefed to
(unsigned long). I don't know why the minix version shouldn't work.

> As I said before, the speed difference is about 20% overall.

I didn't mean to claim that everything would be twice as fast.
I was simply curious as to what people thought they were gaining
by chosing an option that made things at best no slower and at
worst a lot slower.

> 32-bit fixnums.

Fine. But it shouldn't assume that those 32-bit integers will
have type (int).
When I write code that needs more than 16 bits of integer,
I ask for type (long), not for type (int).

> (As near as I can tell, all GNU code is. That's
> because it's mostly true) GCC will not compile itself if you break that
> assumption

Then I'd say the compiler is badly written
(though there are of course varying degrees of badness,
and of all the bad code I've seen, this stuff is pretty good).
You should be able to write code that doesn't rely on (int) being
the same as (long) or being big enough to hold a pointer,
without any loss of efficiency. i.e. on architectures where (int)
and (long) are the same, it will generate exactly the same machine code.

> > Surely 16 is the obvious size considering it has 16 bit memory access.
>
> Nonsense. It makes far more sense to make the default sized frob be a
> common size, so you don't need to worry about it. For cases you care
> about speed, you optimize.

Change "Nonsense." to "Nonsense:", and I'll agree.

The whole point of type (int) is so the compiler will optimize for me
when I don't know what architecture I am writing for.
And if I am writing portable code there is no way I should know what
architecture I am writing for.
If I want an integer value that is more than 16 bits, I'll ask for (long).
If I want an integer value that doesn't need to be more than 16 bits,
I'll ask for (int). The compiler might give me 16, it might give me 32,
or it might give me 72; I don't really care. The important thing is that
the compiler should give me the most efficient type that is at least 16
bits.

> > (Note that I don't consider
> > "so that badly written code will still work ok"
> > as a valid reason.)

> Fine, turn it around. Why is it valid for things that know they want to
> hack 16-bit frobs to declare them ints?

It isn't. They should be declared int only if I want them to be
at least 16 bits.

> To avoid being 'badly written code', they should declare them shorts.

No. If I want something that is *exactly* 16 bits,
I am in on of two different situations:
1) I am writing machine specific code.
2) I am writing a special numerical algorithm.

In the first case, my code is obviously non-portable
so it is fine to use short, or char, or whatever type other than (int)
it is that will guarantee me 16 bit integers on this architecture.
Such code should of course be isolated from the rest of the portable
code, and documented as being very architecture specific so as to
minimize the amount of work required to port the program to a
different architecture.

In the second case, I can still write portable code,
but I have to be very careful about what assumptions I make.
e.g. #define SIGNBIT(x) (0x8000 & (x))
makes a big assumption about int being 16 bits.
But #define SIGNBIT(x) ((~(((unsigned int)(~0))>>1)) & (x))
will work fine regardless of the size of int, and will generate
the same machine code as the first macro when int is 16 bits.
Coding for portabability may require a little extra effort,
but it doesn't mean the result has to be any lesss efficient.

> > Every time anything accesses an int in GCC, it requires two memory
> > accesses. Most programs are full of things like "++i" or "i+=7"
> > or "if(i>j)", and such things take approximately 100% longer when
> > ints are 32 bits.
>
> If you don't optimize them or aren't careful about how you declare them,
> sure.

But I did optimize; I declared them (int) expecting the compiler to give
me the integral type that is at least 16 bits long and is the most
efficient for the current architecture. On an ST, that is 16 bits.

I hope you're not suggesting that by "optimizing" I should have
declared it (short) knowing that I am working on an ST.
That is known as writing bad, non-portable code.

On some some word addressable machines for instance, there are
perfectly correct compilers for which the code for accessing a short
can be far less efficent that the code for accessing a long.
e.g. 3 or more instructions instead of 1.

> > Has anyone made a 16-bit GCC and library and done a comparison?
>
> Yes, it's for sure faster to use shorts than ints.

That's what I was objecting to.
By the original definition of (int),
using int should be exactly as fast as using the faster of (short) or (long).
i.e. regardless of architecture, the best choice should be (int).

> Rather than griping, why not just use the -mshort switch? It's designed
> for just this kind of thing. It's even documented.

Sorry, I wasn't intending to gripe (although I know I often sound like it).
I also wasn't wanting to know how to make it behave the way I wanted.
I was simply wondering why the default behaviour was the way it was.

I think the GNU compiler and libraries are the best available for the ST,
and I certainly can't complain about the price.

I really was curious to see if anyone had any reason why they would
want a 32-bit (int) on an ST, other than for the obvious reason that it
makes it easier to compile badly written code (i.e. code that makes
non-portable assumptions), and so far no one has.

====

> From: hyc@math.lsa.umich.edu (Howard Chu)

i.e. so you can compile code that makes some non-portable assumptions,
namely that sizeof(int) == sizeof(long).
i.e. so you can easily compile badly written code.
I already know about that reason. I spend half my time at work
trying to get all-the-world's-a-VAX Berkely programs to work on
other hardware.

> >Surely 16 is the obvious size considering it has 16 bit memory access.

TeX on the ST:

People who want to get good use out of TeX for the ST should look for the package soon to be released (hopefully December) in the Current Notes PD Disk Library. The Decmber issue of the magazine will also feature a writeup on TeX.

Mice:

The Best Electronics replacement mouse for the ST has impressed a number of my friends.

Practical Solutions also offers a "cordless Mouse", although you'd have to very serious about your mouse to pay the price (over $100). The Best mouse is under $50 and is also available from Joppa.

2884. MAC: a shareware Mac emulator

Newsgroup: comp.sys.atari.st
Date: 1989-11-15 15:09:40 UTC
From: capit@peun11.uucp
Message-ID: <630@nixpbe.UUCP>
Source record: 247006

Hi, I have the idea of releasing a SHAREWARE MAC EMULATOR and would like to get some comments on that. First, a little history: (all playing in Germany)

I developed this emulator starting in 1986/87. Some friends of mine had a small software company and were willing to make a commercial product out of this emulator. In the end of 1986 Magic Sac appeared in Europe. It seemed that Apple wasn't much concerned about it. So in April 1987 we released our emulator under the name of Aladin. After a few weeks Magic Sac had nearly totally disappeared from Europe, and European magazines agreed that Aladin was better than Magic Sac.

All right, but then came Apple (Germany). They raised two legal proceedings against Aladin. They feared a decrease in businesses of up to 30%, and this because of an emulator with the old 64K Roms! They accused us of things, which were clearly wrong, but they put the sum of dispute so high, that we couldn't afford a trial (the sum was 3,000,000 DM, something like $1,600,000). The first legal proceeding had the effect that Aladin wasn't sold anymore in Germany since August 1987 (but still in Europe and some oversea countries), and the second, that the company of my friends isn't selling Aladin anymore since August 1989.

Now I got the idea of releasing the emulator as shareware. Of course I can do this only with the parts that I have developed. This would be the Mac emulator, supporting 64K Roms, HFS, harddisks, sound and printing on Epson-like matrix printers, plus programs to transfer files from a Mac to an ST using the serial ports. (I cannot offer the printer driver for the Atari laserprinter.) The emulator runs system software 4.1, including MacsBug and TMon. I know that this is not the state-of-the-art in Mac emulation, but it would be shareware for about $40-$50.

You would need A KIND OF external device with the Mac Roms (64K), for example a board for the ST's Rom-port and a Mac to get the software from.

If there's enough interest in such a kind of emulator (so that I could live a couple of months from the donations) I would be glad to add other features like support of 128K Roms (already prepared), or an "external file system" to be able to use TOS disks under the Mac OS, or a "switcher" to switch on-the-fly between TOS and Mac OS, or other things you would like to be added.

Now I'd like to get some comments on this idea.

1) Do you think there is a market for such an emulator? I could release this version before Christmas.

2) Has anybody made experiences with sending shareware fees to Germany?

Thanks in advance, Pit

>
> David Megginson, Centre for Medieval Studies, Toronto

I think you mean "emasculated".... unless
you are talking about being deprived of
chewing. On what, i don't know?

Anyhow, I think the main point in all this Atari bashing,
and i certainly have been rather indecorous in that department,
is a manifestation of frustration with and bitterness towards
the Atari COMPANY. Some of us depend on Atari for our livelihood.
Some of us have spent x dollars investing in Atari hardware, software
and so on with the expectation that the future would be bright and
that Atari would provide most of those great products coming out of
R & D. Those expectations resulted from an auspicious start with
the ST in 1985 and from "talk" about the new and up and coming
products. So, it isn't simply the scenerio of a kid and his toys.
I keep hearing: " Well, if you don't like Atari, go buy an X..."
Tell me, is this the way Atari is going to compete in the
the business world? Hell no! If Atari is to compete in the business
world, people in business have to be using Atari's. Rather simple.
Frankly, our hopes are being dashed and our business sense is telling
us it is time to make changes. May just have to buy that "longer"
computer after all and masticate on the losses from my Atari investment
in hopes that i may someday digest them.

I don't know if this has been answered, but could the 68000's instruction
prefetch be causing the problem (The 68010 has a bigger prefetch I believe
which would probably cause problems). Instruction prefetch on a 68000 or
68010 is one good reason NOT to write self modifying code.

Well to my knowledge you can get your atari mouse replaced for 25 dollars thru the exchange program, if you can wiait an extended period of time. My Atari
mouse is fine but I bought a mouse put out by BEST electronics, very ergonomic
and the buttons are really well put together(No pounding on the left one). Another one to consider is the Rio/Datel one, cant say anything about this except it
looks like a rehashed old logitech two button mouse. Finally there is the
expensive Practical SOlution remote mouse, whic works without a tail.
SO in effect you have four mice to choose from in the US, god knows there must
be hundreds in europe.
The BEST and RIO/Datel mice go for about 40-45 dollars
PS remote mouse in the area of a 100 dollars.
hope this is enough info.

2892. Strange programming languages (list)

Newsgroup: comp.sys.atari.st
Date: 1989-11-15 19:08:52 UTC
From: steve@thelake.UUCP
Message-ID: <1015891308520117@thelake.UUCP>
Source record: 247014

I'm compiling a list of strange programming languages for the ST -- and by strange I mean those outside the usual BASIC, C, asm, Pascal, Fortran group.

I would like to hear (preferably by mail) from anyone who has used non-mainstream programming languages on the ST, such as:

* Scheme
* Smalltalk
* Lisp
* Icon
* Perl
* ADVSYS
* Etalk
* and so forth.

I would like to have a brief sketch of the language's characteristics, perhaps an example of what can be done with it, and a note on its availability. I'm interested in commercial packages as well as public-domain, shareware and copyleft programs.

>I want to upgrade my 20 meg SH 204 harddrive to about 40 meg. I hoped I
>could do this by simply replacing the Drive Mechanism
You can.
> * Should I install a 40 meg Tandom hard drive?
The replacement drive does not have to be a Tandom. It can be any hard drive with a ST506 or ST412 interface. These are "standard" drives/interfaces (ie: most hard drives fit this description unless they are specified as a SCSI drive/interface).
> * Can I install a Seagate drive?
Yes!
> * Which models?
Any model as long as it does not have a "N" suffix which indicates it is a SCSI drive (ie: has an embedded SCSI controller).
> * Will I need more parts?
No.
> * Can I daisy chain the SH 204?
You can add a second drive to the SH204 by running cables from the second drive into the SH204 box and connecting to the controller.
> * Will I need different software?
What ever software you use you will need to know some specs on the HD (# of heads, # of cylinders/tracks, etc..) in order to configure/re-configure the formatting program. It's been a while since I used the Atari HD software so I don't recall if it can be re-configured. You could use the software from Supra or ICD (pre-V4 versions) which can both be easily configured for any drive. Both Supra and ICD software already know the parameters to a lot of different drives so all you have to do to configure for your drive is click on the make and model number (if your drive is listed). Otherwise there is a .DAT file you will have to edit and add a line for your drive (not difficult to do).

You should also be careful to get a drive which does not use more than 2 Amps of current on the 12 volts. Some half height 5 1/4 drives will be okay, most 3 1/2 drives will be fine, most full height 5 1/4 drives will draw too much current and are likely to ruin the power supply inside the SH204.

Actually you can use a SCSI drive but a SCSI drive must be connected directly to the host adapter board (the smaller of the two boards) inside the SH204 instead of being connected to the controller board like your current drive is.

Replacing the existing drive is just a matter of pulling out the old one and plugging in the new one, and then configuring the formatting software to be able to configure your drive.

Adding a second drive is a little more work but not difficult. The second (non-SCSI) drive needs to be connected to a second power supply. There are

two cables to connect between the second drive and the controller. The controller has a "spare" connector for the smaller of the two cables but for the larger cable you will have to "tap into" the existing cable (clamp a new connector onto the middle of the cable, a small vice works good for this if you are careful).

Scott, Mark Williams Corp has a toll-free 800 number (which I forgot). But you can call 1-800-555-1212 and ask for Mark Williams Corp in Chicago Ill (or Oak Brook or whereever MWC is at in the Chicago area) and get the 800 number.

A couple of months ago I was told that 3.09 is the latest version. It is a shame but Mark Williams Corp is an excellent example of how Atari has destroyed the US ST market. A couple of years ago, when the US ST market still looked good, Mark Williams Corp was one of the first to provide a PROFESSIONAL level tool for the ST. The MWC C compiler is as good as ANY I have used on an IBM PC or a Mac. The MWC C compiler is a real good program. I can't repeat that often enough. sure there are BETTER compilers to other people, but MWC was first. And last year MWC came out with the C Source Code Debugger, which is a definite plus. And this year MWC has sold the source code to the MWC C libraries.

But, when I enquired about the availability of an ANSI-compliant C compiler, I was told that the MWC C programmer who wrote the ST version is no longer with MWC. I was then ASKED if I wanted to write the ANSI version of the compiler, on contract to MWC. Well, I am a rehashed hardware engineer and have NEVER Written a compiler or I might have just taken them up on the offer. But, the fact that the offer was made, and that MWC doesn't have an ST programmer assigned to it tells me a lot about the US ST market. If MWC thought that our market was growing I am SURE that we would have seen an ANSI-compliant C compiler from MWC by now.

Also, it is telling when a company has to resort to selling the source code to its product to make some money. I mean, you don't see Microsoft selling the source code to their C libraries for $89.95 like MWC has!! I just hope that the US market improves before MWC drops out completely!! MWC has provided me with excellent support, and except for some bugs in their manual, I have learned a lot from the MWC manuals.

All in all, I am very pleased with MWC. And very disappointed that the US ST market is so small that MWC hasn't upgraded the ST C compiler to full ANSI C.

Richard Covert, Long Live Mark Williams Corp!!

>
>This is wrong. ...
[Rationalization deleted]
>Gosh, I don't really remember anymore. Anyway, it isn't 8 million
>instructions per second.

The 68000 processor takes about 8-16 cycles per instruction, on the average. The minimum instruction time is 4 cycles, up to a worst case of 170 cycles for one instruction (a signed divide on an absolute memory address).

The ST therefore operates at about .75 million instructions per second, or MIPS.

With a 68030, however, there are three speed improvements without even changing the clock--the instructions take fewer cycles, memory is accessed in 32-bit chunks instead of 16, and the 68030 has a cache, meaning that it reads data and instructions before they are needed, while it's doing other things.

Result: You can get a 4-8 times speed improvement without even changing the clock rate, and with twice the clock, 8-16 times...

These numbers are approximate, and if you want to argue them with me, don't waste net bandwidth, please! Respond via email and we can hash it out there...

Tim Mensch.

Howard, first I admire some of your programming. I have seen the result of your work and it is excellent. And that is one reason why I *HATE* to see Atari introduce a new machine that is as poorly conceived as the TT appears to be. How is the ST/TT market ever going to attract and retain imaginative and creative programmers such as yourself if Atari doesn't improve the ST/TT?? I really want to see a better TT then the TT/Plastic, and MAYBE, just MAYBE, Atari will hear the SCREAMs of anguish from the customers. It is not too late for Atari to redesign the TT/Tower (which is the model that I am really interested in). I would be glad to want another YEAR to see the TT/Tower with a faster 68030 and 1024x1024x256 colors and multitasking and multiwindows. That's what I want to accomplish by my Atari bashing. As the TT/Plastic is described I would rather pass.

>

> pinching too many pennies there.

Howard, I am glad that you see my point. Too many people are willing to overlook the defects in the ST in their fervor to support it. The penny pinching manufacturing methods useds to make a "cheap" ST shoould NOT be applied to the new TTs!! Who wants to spend $3,000 on a TT just to find that you can't operate your floppy if the hard drive is turned off!! I have seen horror stories of ways that the ST fails from machine to machine. The TT has got to be better then the ST. But, if no one complains than why will Atari change their act??

> Pointless. Rip out the guts and jam in new ones. As far as the Mac is
> concerned, when you do an upgrade you *have* thrown away your computer

> pointless.
>

It is NOT pointless to show how another company supports their customers. The big point is that apple gives you the option, the choice. Sure it is expensive but the best things in Life Aren't Free!! And the main point is that Atari DOES NOT give you the choice. sure, you can buy a Mega ST instead of a 1040ST but you are still getting the same basic machine. And maybe, just maybe, someday in the 90's you will be able to buy a TT/Plastic.

But that's ALL the choices that Atari gives you. No enhancements like better color graphics, or a faster processor. Just a cheap unexpandable computer. It would be nice if Atari would give their customers more CHOICES!!

> (Must admit, the current Ultrix stuff is Very Slick...)
>

The Claris case is concerning APPLICATION software. My GDOS example is SYSTEM software. No body can do a better design for SYSTEM software than the system manufacturer. So, the MacWrite is not the same as a BAD GDOS. It is the same as a CRAPPY DESKSETII though. And from what I have heard DeskSet II is a real DOG!! So, you are right, Atari should leave application software to the third party vendors. But, I am right in that Atari should FIX GDOS and make other SYSTEM level improvements.

> --

Actually, Howard, you are totally correct in your analysis of the PC market. I am researching various OSes and GUIs for the PCs and it is a total wildhouse. There are scores of different and incompatible little screen programs for the PC and strange things such as PC-MOS and MicroSoft Windows. The GEM/TOS interface may only be singletasking but it beats MicroSoft Windows hands down. Do you know how you develop a MS Windows application?? first you write your C code under DOS, compile, link, load. Then you boot MSW (Microsoft Windows) and try to execute your MWS apps. If it fails you have to exit from MSW, and do the edit-compile-link process until you THINK you have solved the problem. Then reboot MSW (which is slow/fast depending upon your HW [286 or 386]) and try it all over again. Obviously you have few if any SOURCE code level debugging tools available. And MWS is the BEST and most popular windowing package available for the PCs.

So, TOS is great compared to PCs and MSW. You 640K barrier like with an IBM PC.

Geez, I just *WISH* that Atari would design the TT with State of the Art features!! The TT *COULD* have been the IBM PC killer, but I don't see that happening given Atari's lack of committment to the USA!!

>David L. Newton | uunet!marque!carroll1!dnewton | The Raging Apostle--

As stated many times before, Mhz does not have all that much to do with the actual speed. The whole architecture must be taken into account... One thing that slows down Macs is their CPUs handle EVERYTHING. That includes mouse and keyboard activities, floppy/hard disk controls... Really slows things down.

> the marketplace.

Alleged by Leonard Tramiel several years ago (and paraphrased):

CASH? The Warner deal was closed with Jack's American Express card (it was
a friday in New York, and it was after five...).

The Warner Atari wasn't precisely _bankrupt_ -- that's a technical (legal)
term. Rather, it was simply hemmoraging cash; IMHO it wouldn't have
survived another month or two without SOME kind of drastic intervention. In
Warner's shoes, with losses to the tune of a million bucks a day, I'd want
to be rid of it *fast* -- wouldn't you? :-)

2908. Avatex 1200hc driver and BobTerm

Newsgroup: comp.sys.atari.st
Date: 1989-11-15 23:18:07 UTC
From: krieg@jupiter.uucp
Message-ID: <1428@mrsvr.UUCP>
Source record: 247030
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I recently upgraded my ST sytem to 2400 baud, and moved my 1200hc to my 130XE. I had previously used Kevin Ledbetter's term program for the XM301 (I used that term program for years, and now I can't remember the name of it). I wanted to use his program for the 850 and P:R: connectors, but I couldn't get it to work. The software was included in my P:R: connector's box, but it wouldn't go. I also tried BobTerm (which everyone tells me is the best) but it also would not work. I have managed to get DeTerm to work. The Ledbetter program has a built in driver, so I don't know how I can get that one to work. I have tried using the driver that works for DeTerm on BobTerm, but the system does bizarre things after the dialing is finished. I have yet to make a connection with it.

Do I need a special driver? Anyone know why Ledbetter's program (Ah, now I remember, 850 Express) doesn't work with the 1200hc? Could someone e-mail me the driver they use for BobTerm? Once again, the system I am using:
* Atari 130XE computer
* P:R: Connector interface
* Avatex 1200hc modem

DeTerm works OK, but I'd like to see if BobTerm or 850 Express are better. Thanks.

Are you running Atari's CACHEXXX program? I had a friend who had the
problem you described, and it went away when he took the cache out of
his auto folder. It seems Turtle does some low level disk accesses that
can make the cache confused.

WANTED-- BADLY.

I'm looking to buy a new computer to replace my trusty old Atari ST.
1) It must use the Motorola 68030 or 68040 CPU and be multi-tasking
as standard.
2) It must be very very fast for number crunching and graphics.
3) It must have a very very fast bus that meets the following:
A) The bus must have 32 bit address and data lines.
B) The bus must allow for multiple bus masters.
C) The bus must allow backplanes for extra slots to be added
from one slot.
D) The bus must be a standard that has lots of cheap third
party boards on the market including:
1. A standard graphics board of at least one Mb of
bit mapped resolution.
2. Memory boards for expanding up to the full addressable
limit at full CPU speed.
3. A LAN.
4. Weird and wonderful devices.
4) It must come in a rugged expandable case with a hefty power supply.
5) It must have lots of i/o capability built-in, including:
A) SCSI.
B) Standard Centronics parallel.
C) Serial.
6) It must have a battery backed clock.
7) It must have a full, nice feeling keyboard with cursor keys
arranged for easy use, a numeric keypad, and function keys.
8) It must have a mouse.
9) There must be lots of very fast, cheap, high capacity hard drives
available for it.
10) It must be able to transfer data to/from the hard drives at the
full speed allowed by the drive mechanism.
11) It must have a comfortable internal architecture for programming
with lots of interrupt and i/o control done by support chips.
12) There must be lots of software support for it, including:
A) A cheap, full featured UNIX. (real UNIX)
B) A cheap, really good, ANSI standard C complier with a source
level debugger.
C) A cheap, really good wordprocessor.
D) A cheap, really good desktop publishing program.
E) A cheap, really good CAD program.
F) Many other programming languages.
G) A huge, growing public domain base.
13) It must have really good stereo sound.

14) There must be lots of people using and supporting it.
15) It must be really cheap.

If you have seen this computer around, please tell me. I want to buy it. My phone number is 686-0808, or you can write to scott@cie.uoregon.edu.

I've see places advertise "replacement" mice for the ST for around $49.
However, if you have access to or know where to get a Commodore Amiga
mouse, it will work if just two wires are interchanged inside the mouse.
I don't remember which two, but I have the info at home. If you or
anyone else wants the info, I can send it or post.

Just another alternative...

P.S. I've tried one and it seems to work quite well (light feeling and
very good response.)

About having a comp.atari.st.tech group:

Would everyone on the net want to have Atari officially answer technical questions on the NET? I have seen other companies start to do this and it distresses me. I feel that the USE NET should be kept the USE NET not the Interactive Systems Net, not the IBM net, not the Atari NET. If they start officially doing their business here, message volume will greatly increase along with phone bills of the non-business nodes that are paying for the business expenses of communications, or rather an alternative to 800 number support lines. (Not saying that Atari has support lines already).

>(I don't own a NeXT. Heck, I've never even SEEN one. I'm just an interested
>watcher from the sidelines.)

Thanks for the information, Steve. I have heard rumors about the hard drive
being installed in every cube, but I couldn't find a reliable source. I'll
check out comp.sys.next.

By the way, I have seen the NeXT. It was at a computer show in Austin Tx.
The sales representative was from an Apple background and really didn't
know the technical background of the computer, just the names of the software
that the store he represented sold, which was just the operating system.

The Next took a seemingly endless time booting. The optical drive seemed
to really drag. Over all, I wasn't impressed with the machine because of
the demonstrator and because of the slow drive access. I got so board,
that I started to talk to a salesman selling Bottled water for healthy
computer office environments. I won't judge NeXT on that demonstration,
though. I think it was just a bad environment for that machine.

Thanks to Greg and Stephen there's finally a voice of reason to be
heard through the thunder of these annoying flames. No, I don't want
to start another "me too, ma!" but I didn't read this news for some
time now just because I was bored with all these silly flames.
We here in Europe bought A LOT of those nice machines and are pretty
convinced of their power, if I had found that they weren't worth the
money we would have sold our 50 STs and would simply buy other machines.
What I NEED (concerning this news group) is information how to make the
most out of my ST, not blurbs like 'they didn't build THAT in!', you
see? If people are willing to discuss the problems they encounter
when working with an ST I'd be willing to offer the help I can give.
But hearing of design flaws, bad support, rotten hamburgers or the
like is ineffective. This list could be of some help, really, but
it seems to change to a center for disappointed geniuses who didn't
succeed in building their own computer. Say Goodbye to Hollywood.
- Klaus.

2923. Anyone know a good source for ICD adapters?

Newsgroup: comp.sys.atari.st

Hello all,

... can someone please recommend a good source (computer store / mail order business) in the USA that will ship to Germany?

I am looking for a good price on the ICD host adapter. I need 3 of them (they are for resale). I once wrote a letter to ICD that was never replied, they sent me their catalog as an answer. So I didn't even try to write them directly.

Thanks for any info. Please reply via email.

'MSG:FROM: ESC1457 --ESOC TO: INFO-ATA--EXTERNAL 89-11-15 13:45:52
To: INFO-ATA--EXTERNAL

From: Coenen, Jean-Pierre
Subject: TCP-IP status (?)
Hi all,
I have downloaded from SIMTEL20's archives the KA9Q package,
some basic features doesn't seem to work properly though.
System in use 520 ST 1 Meg first ROM (0.19), SH205 (20 Meg).
The problem is in the file interface, that is in the filename
built using sprintf, the PC use a slash and the atari should
use a backslash (ie. doubled in fmt string of sprintf).
As the system was crashing quite a bit when trying to get a
smtp between the ST and a PC, I transferred the sources
and it appears that both NET and BM used the same sprintf structure.
Now I have the prospero C (Pascal and FORTRAN also BTW and I like their
compatibility, documentation and user friendly interface) and hacked
the BM sources to have it to work properly (filename) it ... worked
as I do not want to hack the NET sources I was wondering if
it was possible to have a more useable version for the ST.
(BTW I zapped the run time modules trying to change in the code
the slash in double backslash ... guess what ... Bombs 8-).Any help
would be greatly appreciated.

2925. Multitasking TOS

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 08:03:31 UTC
From: ONM07@DMSWWU1A.BITNET
Message-ID: <8911151404.AA14503@freya.math.dmswwu>
Source record: 247047

As Allan mentioned, there are a LOT of problems with existing applications on a multitasking TOS (example: these programs, taht malloc all the memory).

A good test for well-behaving programs is Michtrons program 'juggler', which 'simulates' basically a multitasking GEM.

So, wouldn't it be a good idea to make a list of "DO's AND DONT's" NOW. Otherwise, there will never be a multitasking GEM for the ST, because few programs will run.

2926. Booting old RAM TOS from Hard Disk

Greg Wageman makes some marginally interesting comments about my posting concerning the "blitter fraud".

In the "Real World (tm)", there are things known as Warranties of Merchantability and Fittness for Purpose. There are also things known as Truth in Advertising, and Fraud.

Both Commodore Business Machines and Atari Corp. have been forced by law to produce products they had promised, but which for their own reasons they didn't want to actually produce. The Commodore-64 CP/M module and the Atari XF-551 Disk Drive are two examples.

If Greg Wageman had been one of the people who had bought an Atari ST based on the promises of the Chief Executive Officer of the company, I'm willing to wager he too would be more than a little upset when the implied contract was broken.

As far as technical details, the "blitter upgrade" had been promised by many different Atari Corp people over a span of several years. It was not something that a stupid executive just happened to blurt out on a TV "talk show". There had been upgrades/daughter boards/motherboard swaps discussed by Atari for years. This created an expectation of performance for those who invested in Atari equipment. Atari obviously expected that a blitter equipped "vented case" 1040 would pass FCC certification because they redesigned the motherboard with a blitter socket position. "Do It Yourself" blitter upgrades are possible *if* you have the right motherboard. That leaves us with the question of why Atari didn't do it themselves...

I'm left wondering how the STE with its "vented case" design can add video enhancements and SIMM memory to 4 Megs and still pass FCC certification if the Blitter would have pushed it over the line.

Sorry if I've exceeded my message allowance by posting this reply, and I'm further sorry if anyone reading this is annoyed that it's not an Atari cheerleader message. I don't much care about a blitter chip and I don't plan to say anything more about the subject. Atari Corp lied to their customers, and that annoys *me*

I *would* be interested to see what would happen if a group of dissatisfied Atari customers decided to challenge Atari in court over this issue.

>
>Overall, I would stay as far away from Tech Specialties as possible.
>They are crooks, and their hardware is just average, certainly not
>worth the seemingly endless nonsense you have to endure to get your order.
>
>-- Jim

I purchased my Tech Specialties 1MB upgrade from a local dealer here in Albuquerque for $263.07 on March 18, 1988 for my 520ST. This included dealer installation and the clock option.

I have had NO trouble with the unit at all, and am recently thinking of using the UPGRADEABLE aspect of this unit to move on to 2.5MB.

I see no problem. Of course, I'm not dealing directly with Tech Specialties. I am (was) very happy with the service my dealer gave me - if there was a problem with the unit, my dealer would've taken care of it.

By the way, anybody want to buy my old 256k RAM chips? I figure I can make up about 1/2 the cost of my upgrade if I can sell them ($80/free delivery).

I have a public domain version of Smalltalk, called Little Smalltalk.
This is together with Icon (another language) on a disk, available from
each PD distributor in Germany.
This version is without grafics, i think (I actually did not use it),
solely the language. One my say Smalltalk without grafics is not
Smalltalk, but it is free, just to get a feeling of real Smalltalk.

I know of a professional version of Smalltalk for the ST. I read a review
about that in some german computer magazin. As far as I can remember, the price
would be ca 2000 DM (ca 1100 $), for students and teachers considerably fewer.
It is a complete and stable implementation of Smalltalk-80.
More information can be obtained from georg@unido or georg@unido.uucp.bitnet

When I started 'home computing' many bits had to be purchsed from the U.S., and in the U.K. the simplest way has always been to us VISA or MasterCard (Known as ACCESS in the UK). The only problems I have had have been with a damaged memory card which the UK Post Office cracked. The only other small snag is you don't actually know the cost until the bill arrives as you normally get the exchange rate on the day its posted to your Visa account. Oh and of course you need to get the sender to put in an invoice or receipt so the PO know how much duty to charge. I don' know how this works in the US but it ought to be itemised. For example when importing Software into the U.K. duty is only payable on the value of the MEDIA it is stored on.
Hope this helps.

I am a registered MWC purchaser also, and I recieved no notification.
I have heard *rumors only* that there may even be an ANSI "C" version on the
way. Any confirmation ?
As far as apparent bugs. I typed the line setting the environmental
variable TIMEZONE for the Chicago area into my profile. The example given
is for Chicago, but it didn't work even though my built-in clock was set
properly and I typed the example in verbatim. It was off by several hours.
I even had the year set correctly. I found that if I ignored TIMEZONE in
my profile, then it would work properly.
I have version 3.0.5

/* Written 11:34 pm Nov 12, 1989 by Bob_BobR_Retelle@cup.portal.com in
uxf.cso.uiuc.edu:comp.sys.atari.st */
Some text deleted...

Atari Corp is a toy company which has established a reputation for being
poorly managed, and for its capricious treatment of its users, dealers
and suppliers. While the "Atari ABC" may be the computer of the week now,
you may find yourself holding an obsolete system when they go off after the
next glittering gizmo and leave you with an unsupported orphan next week.
/* End of text from uxf.cso.uiuc.edu:comp.sys.atari.st */

Try to control your passion there, Bob. Take a breath...
I am a computer engineer at the U of Illinios
in Urbana / Champaign. I am using an Atari with 2mb internal memory,
50 meg of hard drive, an 8Mhz 68000, and a (Robotics) courier 2400 to
write this note. I also use it for two of my three classes and to access
the Library Computer system. Don't you think "toy" might be an inappropriate
choice of words. This system will out-perform the majority of the IBM hardware
out in the streets today. In fact the IBM emulator on my Atari has a Norton
SI rating between 2.5 and 3.0 because of the power of the 68000 (RISC
architecture). I can also read and format IBM formatted IBM DD/DS 3.5" disks,
and with some software and a couple of chips could emulate a Mac as well.
I am a month from graduation as a computer engineer, and I consider
the Mega ST2 to be a fairly powerful machine (definitely out of the range of
toy). I would further state that it can clearly outperform any IBM in its
price range for the majority of tasks a home user would want. Do you beg to
differ with me ? I got my system for slightly over $2000. What do YOU
own. I'll bet it's 1) more expensive or 2) less powerfull or 3) another
"toy" computer.
On a similar note, Atari doesn't have a history of producing obsolete
equipment. Do you consider the M68000 to be any more obsolete than the
equally new 80286 technology IBM uses? If and when the TT is delivered, it
will use the 68030, which will still run my 68000 programs. My ST software
library will not be wasted. Please give a name to this "unsupported orphan
product".
On the other hand, you are right about their tendancies to introduce
new ideas into the marketplace before they can back them up with hardware and
also about their lack of support for dealers. Some entities like businesses
who require a full-service shop with personel knowledgeable about the products
would be ill-advised to get an Atari. However, for my personal use, I have
never had to bring an Atari in for service. The Atari has made a lot of
sense for me, and I don't regret having purchased it. In the few cases where
there are trouble though, it will be more difficult (not impossible though,
I have a full-service dealer within 5 miles of where I live for example) to
get repairs. Also, if you want to run protected IBM or MacIntosh software,

then an Atari is out. Overall, though, I'll definitely take my Atari.
P.S. I have used IBM's and Macintosh's quite a bit in school. The IBM's are too expensive and their software isn't nearly as user friendly. The Mac's are black and white on a too-small screen. The Mac II's are very nice, but too expensive. There are my opinions. I think most of us are *quite* familiar with yours by now :)

Those who have been so helpful here on UseNet have been so on their own time.. and at their own peril.. information from Allen, Ken and the others from Atari has helped to fill the "official" vaccuum from Atari... and yes.. they do deserve the utmost thanks from ALL Atari users...!

In this spirit, I would like to register my formal thanks to those from Atari who have participated in this notestring. I agree that it does help out us poor underinformed users, and take some of the sting out of the rumors that can fly around at times. If Atari doesn't recognize the importance of your presense, that is unfortunate. I think you have helped Atari's rep to some degree as well as collected some feedback from the users for your own information (I know some of it is frustrating). As you are finding, people can jump to the wrong (bad) conclusions if they are not supplied with enough information.

Another vote for an end to this consistent Atari-bashing. Maybe
a radical design improvement suggestion or somesuch would be in order, but
beating Atari to death with blunt words over the same issues time after
time is getting very old in a hurry. If you want to put out specs,
please keep any non-constructive (judgement call) comments to yourself.
Some of the Bashers are just plain rude, they know they are just being
petty irritants. Others might not realize they are being repetitive
or talking about products they know little about. I agree with these last
few notes, lets agree to clean up our act and get a little more
constuctive.
Thankyou.

Maybe for you, but not for me: I like to experiment, have some data
collection cards goin' in unison, have a coprocessor doing some crunching.

>Any analog-digital converter SHOULD be designed to plug into a DMA, SCSI
>or some other fast port. This way, it won't be computer specific.
>In general, computer specific hardware addons will be a thing of the past.

Since when is VME a computer-specific thingy? Seems to me I've seen a
lot of VME-based computers.
SCSI-basid things would be okay, until you have more than seven. DMA
is great too, but after a few daisy-chains, how do ya' do it? (Don't know
how things are accessed using DMA.)

>I bet that those card slots in the IBMs aren't much faster if they are at
>all).

Cards in the PC that don't do DMA are clocked at 8MHz on the AT.

I LIKE well-done advertising on the net. What I mean by well-done is short (like <= 30 lines), techy and posted only once. If you check the guidelines in news.newusers, you'll find that this is explicitly permitted, too. What I don't like is ads that are long, 'clever', repititious, and posted more than once. I tend to inform posters of 'poor taste' ads by replying to their ads, and so far, they have replied politely and have agreed.

>to miss the MSDOS/UNIX type abilities to just type CD somewhere or
>run a program anywhere by typing its name or path, or the advantages
>of simple batch files. ....

I know that several have answered this, and most have mentioned GULAM,
but I would like to add this:

I like Gulam, because of its large set of built-in features,
including these, which I think are its major assets:

MicroEmacs, terminal emulator, command line editing,
xmodem file transfer, and shell scripts.

The shell scripts are quite like the cshell I use on the VAX
at the office, and so, for quite a few things, the commmand set
is the same. Where there are differences, I feel that I have
the control, through the use of shell scripts, to make them
enough alike that I feel comfortable and productive in both places.

Those who know UNIX will recognise some commands in the list
below, which I see when I press the HELP key.

```
==============================================================================
beta-test version 1.03.04.05 121887 of
yet another shell for AtariST/TOS

(non-profit redistribution is permitted)

/gulam. Copyright = 1987 pm@cwru.edu

62 built-in commands:
alias dm endwhile help more printenv set ue
cat dirc exit history mson pushd setenv unalias
cd dirs fg if msoff pwd source unset
chmod echo fgrep kb mv rehash sx unsetenv
copy egrep foreach lpr peekw ren te which
cp ef format ls pokew rm teexit while
date endfor gem mem popd rmdir time
df endif grep mkdir print rx touch
==============================================================================
```

In addition to the things here, there have been a few things
distributed over the net that I behave much like UNIX commands
I like. An example of one of these is LV, and later STEVIE,
which are much like "vi" .

I am not sure that UNIX is the best operating system, but I does have some very nice advantages. The fact that GULAM has the same set of commands means a lot to me.

Has anyone had any experience with any removable, high-capacity drives for the ST? I recall Supra has an FD-10, or some such, 10 Meg floppy. A company called Westco Electronics advertised a Bernoulli type device, but their phone number is no longer in service. A couple of companies are supposed to be working on 20Meg 3 1/2" systems (not specifically for the ST), but I haven't heard any announcements. So, are there any devices such as this available now? And what has been your experience with them? Thanks for any info.

Calvin Yockey
University of Arkansas
cjy@uafhcx.uark.edu

P.S. I am VERY excited at the prospect of David Small providing a low cost upgrade path to the 68030 and TI Graphics chip! Go to it, Dave!

2949. Bounced mail to Berkeley

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 13:49:01 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891116.07490041.079416@SFA.CP6>
Source record: 246971

Vance Chin of Berkeley Micro Systems writes:

"Larry,
Since there was all this discusion one the net about what rev to
have on the Seagate ST-296N we decided to buy one. the results are:

When Segate upgraded the "rom rev" of the ST-296N to "REV 8" they
also changed the timing of the SCSI bus. This had the affect of requiring
a faster handshake for each byte. So, if the host board you are using delays
the signal to long it will have to wait for the next transfer phase. This in
turn takes longer to transfer the data block from the drive. On our host board
we used a 1:1 interleave to achieve the maximum data rate with no problems on
a Seagate ST296N rev 8 drive.
This is why Seagate is bemused when you call them up and say " The drive
won't work 1:1 on my system". Seagates tester runs them at 1:1 interleave
inhouse to test them faster.

Vance Chin
Berkeley Microsystems"

Vance,

Thanks for the information about the 296n transfer rate. My only
question at this point is why the SeaGate is the only one with this
difficulty with the various host adaptors?
I'd be willing to buy the Berkeley host adaptor if I knew for sure
that I could get 1:1 to work.
As usual, many thanks... you have always been helpful on the information
department.

From: U009@CCIW.BITNET
Subject: Blitz- my impressions
To: Info-Atari16@Score.Stanford.edu (

Hi again. Just a couple of thoughts about the Blitz duplicator.

Great innovation. Ranks up there with the Magic Sac and Spectre as
a great hack. All the more impressive because it's the type of thing:
"Gee, I could have thought of that!" In fact, after the first disk came
off, that's exactly what I thought.

How does it work? It seems to control the "from" drive by the normal
floppy ports, using pulse width modulation (PWM) on the MOTOR ON line to
adjust the floppy rotation speed. It controls the "to" floppy completely
thru the parallel printer port, and I imagine it uses PWM there too. The
program observes the index pulses from both drives and adjusts the rates
so both floppies rotate in synchronism. The read data from the "from"
drive is connected directly to the write data line on the "to" drive (see
table below). When both drives are synchronized, the write gate line is
activated for 1 revolution and all the data is copied to the "to" drive,
keeping all pulse widths and relative timings identical. The routine then
advances to the next track and repeats the operation.

The same process could be used to build a stand-alone duplicator for
5-1/4" drives too. Probably an 8031 or even an 8748 would be all that is
required in a processor. A couple of switches to select 40 or 80 tracks,
1 or 2 sides (or default to 2, it's only an extra 20 seconds) and the 2
drives.

>because YOU have not seen one does not mean it does not exist or it is
>vapourware. The same goes for the TT, the ATW, the STACY, the LYNX.

On the subject of future machines, I recenetly read that the
availability of the new "STE and TT" machines would be announced in
Feburary of next year." The STE will apparently be '030 based and
have something like 1000x7000 colour pixels. Cost for one of these
will be about $1,600. That's a fairly amazing price for a 68030 box.

Does anyone have the real dope on when we can expect an '030 Atari
machine in the states and will it really be inexpensive? I've been
thinking about getting something cheap just for music applications
(cheap meaning the Mac is too expensive) and the MEGA fills the bill,
but with the '030 based Atari's just around the corner.... well.

Any details?

>If Greg Wageman had been one of the people who had bought an Atari ST
>based on the promises of the Chief Executive Officer of the company, I'm
>willing to wager he too would be more than a little upset when the
>implied contract was broken.

I have _never_ personally seen an advertisement from Atari which promised that the 1040ST would have a blitter chip. Moreover, I have _never_ personally heard the CEO of Atari state that a blitter chip would be provided to all 1040ST owners.

I _have_ read numerous rumours over the past 3 years, posted by any number of people, NONE of whom were officially connected with Atari, to the effect that this or that piece of hardware/software was "coming soon" from Atari. It seems to sell magazines ...

I note that the PRELIMINARY review of the 1040ST in Byte magazine _does_ include mention of a blitter chip -- the authors also noted the empty spot on the motherboard for the RF-modulator. I did not purchase a 1040ST based on the review (which, as Byte magazine editors were so careful to point out, was _preliminary_, ie. subject to change).

>As far as technical details, the "blitter upgrade" had been promised by
>many different Atari Corp people over a span of several years. It was not
>something that a stupid executive just happened to blurt out on a TV
>"talk show". There had been upgrades/daughter boards/motherboard swaps
>discussed by Atari for years.

Big question -- was this during the Neil "two weeks" Harris reign of error? And do you have proof that such "promises" were official Atari Corporation press releases, or were they off-the-cuff remarks made in response to questions about the blitter chip to the effect "we're working on it"? Did you get a definite release date and a written committment beyond "we're working on it"? Names, dates and places, please.

I'm pretty tired of hearing about "nameless" officials at Atari who did this or that. If you have evidence, present it, otherwise cease and desist.

> This created an expectation of performance
>for those who invested in Atari equipment.

The "expectation" has been built by countless ST owners passing numerous rumours off as fact.

> Atari obviously expected that
>a blitter equipped "vented case" 1040 would pass FCC certification because
>they redesigned the motherboard with a blitter socket position. "Do It
>Yourself" blitter upgrades are possible *if* you have the right motherboard.
>That leaves us with the question of why Atari didn't do it themselves...

Perhaps they took it to the FCC and it _wasn't_ certified? Without any more information than you've provided, that's the first conclusion that I'd come up with, not the one you seem to prefer -- "it was a marketing scam".

>Sorry if I've exceeded my message allowance by posting this reply, and I'm
>further sorry if anyone reading this is annoyed that it's not an Atari
>cheerleader message. I don't much care about a blitter chip and I don't
>plan to say anything more about the subject. Atari Corp lied to their
>customers, and that annoys *me*

They didn't lie to _me_. I'm a customer. Ergo, your assertion is false, or needs to be modified. But then, I'm the sort of person who purchases a computer for what it can do _NOW_, not what some magazine or well-meaning owner _thinks_ should be available in the future.

Anyone who purchases a computer for what they _think_ might be available in the future is foolish.

>I *would* be interested to see what would happen if a group of dissatisfied
>Atari customers decided to challenge Atari in court over this issue.

Personally, I don't believe they'd have a leg to stand on. Your evidence is hearsay, the technical specifications as released by Atari are not false, and there are any number of ST-oriented magazine articles (which do NOT quote Atari officials) which clearly label some of the things you believe were promised as "rumor" ... Atari cannot control rumor except to state, as they have over the last few years, "we will announce no new product before its time".

By the way -- showing something at COMDEX does _not_ constitute an announcement unless they start distributing technical specifications, as Atari did in Germany with the TT.

-- David Paschall-Zimbel

2957. Hard Drive add-ons and net professionalism

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 16:43:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8911170805.AA23057@ucbvax.Berkeley.EDU>
Source record: 246979

In a message to a reader who asks about upgrading his SH204 Hard drive
Ray Wallace piques my curiosity:

1) As a non-SH 204 user I would like to ask what is in the guts of an
SH 204. I assume that it is an Atari Host Adapter with an Adaptec
controller. If this is the case the Seagate drive (say an ST 251)
that would be added on would connect to an extra port on the
controller and would therefore have the same SCSI address as the
original drive but a different LUN number.

2) Might it not also be possible to fashion a daisy-chain cable for the
SCSI connector from the host adapter and go to an embedded SCSI drive?

3)> I am under the impression that ICD's formatting software looks for an
ICD clock at SCSI unit 6 on the bus, a feature that is unique to ICD's
host adapters. Tom Harker told me that this is why they are so
generous in passing out their software, since only owners of ICD host
adapters can use it.

4). The ICD formatting software from ver 4.xxx up is much more user-
friendly than previous versions and is highly to be recommended. I
think that new drives can still be added, but I am not sure of this.
The version 4.2 ICBDBOOT program also aoffers significant advantages
with built-in caching and a fix for the 40-folder problem.

5). Those who are using the HDX program to format drives should be aware
that an updated version is available on most decent BBS's (ver 3.01?)

6). If I were going to do what our correspondent wants to do I would sell my
SH 204 and get an ICD host adapter, a case with a good sturdy power
supply, and a suitable drive (embedded or non-embedded (also needs a
controller). I'll bet that this would be more trouble-free in the
long run. With the ICD host adapter you can also use a longer cable
from the ST to the drive, and this makes a lot of difference.

Wallace's information is certainly nice and clear and quite correct. I am
simply offering another point of view. The tool is called a "vise". A
"vice" is something different.
I subscribe to Steve Goldstein's pledge.

In the June 1989 Current Notes I wrote a column solciting interest in
a professional organization for Atari Users along the lines of DECUS
in the DEC world. This fell on deaf ears in that context and on
GENie, but netland may be more fertile ground.

It would be nice to know how many subscribers INFO-ATARI16 has.

Is there any interest in maintaining a membership roster on one of the archive sites? Perhaps some of our people could post lengthier writeups on technical problems like using TeX and TCP/IP software and hardware for the ST. There are lots of issues like this that could use a more coherent appraoch than the bulletin board system seems to offer. Some of these articles might make it into the Atari press.

I'm sure that the people who are paying for all of this net stuff expect the users to get some solid professional benefit out of it and it would be nice to see professionalism on the paert of the net users get a proper airing.

For those of you who have written asking for the TCP/IP package
for the ST here is one place to get it.

By anonymous FTP from col.hp.com
look under ka9q/pe1chl

for the ST there are two archive files of interest:

890814st.arc object files
net_doc.arc documentation for this version of the ka9q code

I believe that 890814st.arc is missing 'bm.tos' which is a mailer.
I will try to upload that into this same directory as soon as I can.

Source record: 246983

I have no problem with small business on the net, as long as they don't ADVERTISE. It is my understanding that no commercial advertising is allowed on this net. I have no problem with the idea of information being passed on the net. What I do have a problem with is blatant commercial advertising. If the 'Blitz' poster had said... "saw the Blitz stuff last week call xxx-xxxx for details" or something like this, I wouldn't have had any problem. But when the ad is layed out with bulletted selling points and slogans and such, it becomes not just a piece of information, but an attempt to sell something.
Granted, this is my opinion and what we're talking about is drawing the line between information and enticing to buy.
In my opinion the 'Blitz' posting was a commercial advertisment and I have no tolerance for commercial ads on the Net.
I did not ask for an ad concerning the networking services on the net, but rather recommendations based on other users experiences. I asked for this to AVOID having to read advertisments.
I think it's fine for people to point other people towards new products and information about these products. The question is- what is the posting intended to do, inform people or try to sell them something ?

As a matter of fact, I've just gone back and looked at the original posting and the word 'Advertisement' is at the end of the title line.

Also, the poster has a banner at the top asking anyone to mention him when and if they call about Blitz.

Sorry, but this is definetly an ad AND is not allowed here.

2965. Multi-Switch cable: A review

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 20:19:23 UTC
From: atlas@cbnewsd.ATT.COM
Message-ID: <3151@cbnewsd.ATT.COM>
Source record: 246987

Product Review: Multi-Switch cable for Atari's and Multisync-type monitors
Manufacturer: IB Computers
9244 S.W. Beaverton-Hillside Hwy
Beaverton, OR 97005
(503) 297-8425

Background: I delved into the world of Atari color by purchasing an AT&T CRT329M Multisync-type monitor. In fact it comes off the same assembly line as the NEC monitors and is identical to the II+.

I had planned on having my local Atari dealer make a cable for me; the specs for which have already been broadcast over the net. He turned me on to this new product, Multi-Switch. He gave it to me at cost since he wanted feedback on how it worked. ($US 32.95)

The 4' cable has a 3"x4"x2" box mid-length with a color/mono button. As expected, changing to and from mono and color reboots the system. There are also two RCA jacks on the box for audio-in and audio-out.

Results: What versatility! The monochrome mode is a bit hazy on using multisync but its quite acceptable. The color modes are exhilarating. Crisp and solid displays. 8^)

There wasn't enough juice on the DIN cable to sufficiently power the box, so I was forced to buy a 9v. 500mA adaptor. There is a female-side inlet built into the box, so they must have expected this problem. The last outlet on the power strip thus being eaten up. 8^(

I do miss a volume control on the audio. I have lots of background noise as home (two boys) and can't drown it out anymore. 8^(

Overall, I would rate this as a solid product for those of us who need it. It has it's shortcomings but I consider them minor in light to the versatility provided by the monitor.

HI FOLKS,
AS PC-DITTO II SEEMS DELAYED (CERTAINLY THIS SIDE OF THE POND IN
MAGGIES KINGDOM (MAY SHE REST IN PEACE (SOON!)) THE OPTIONS SEEM TO BE
SUPERCHARGER OR PC-SPEED. I WOULD GO FOR PC-SPEED EXCEPT THAT IT DOES
NOT SUPPORT MATHS C0-PRO (8087) THUS I WOULD LIKE ANSWERS FROM ANY USERS OF
THE ABOVE DEVICES TO A FEW SIMPLE QUESTIONS.

1) IS IT POSSIBLE TO PUT AN 8087 ON TO PC-SPEED, IF SO HOW EASY IS IS, IF NOT
IS THERE A POSSIBLITY IN FUTURE DEVELOPMENTS.

2)IS THE OLIVETTI SCREEN THAT PC-SPPED EMULATES THE SAME AS THE A.T.&T. 6300
SERIES GRAPHICS DISPLAYS.

3) DOES PC-SPEED WORK WITH HYPERCACHE, NOT WILL ONE BENEFIT THE OTHER BUT WILL
THEY SIMPLY RESIDE IN THE SAME MACHINE WITHOUT CRASHES (MEGA 2).

4) HOW CHEAP IS IT TO UPGRADE SUPERCHARGER TO 1 MEG.

5) DOES SUPERCHARGER WORK WITH ICD CONTROLLERS (ST-WORLD SAID IT DOESNT).

IF ANY EUROPEAN READERS (OR AMERICAN COME TO THINK OF IT) CAN ANSWER THESE
THEN PLEASE DO (ESPECIALLY HANS-JORG SACK IF HE READS THIS).

2968. Atari Post Loss of $5.4 MILLION in Third Quarter

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 20:38:47 UTC
From: jvance@bonnie.ics.uci.edu
Message-ID: <1989Nov16.123847.4119@paris.ics.uci.edu>
Source record: 246990

This is HOT off the press. I thought everyone on the Net might like
to know.

OTC 11/15 0956 ATARI POSTS LOSS OF $5.4 MILLION IN THIRD QUARTER

SUNNYVALE, CA (NOV. 15) PR NEWSWIRE - Atari Corporation (AMEX: ATC) reported the results of operations for the third quarter ended Sept. 30, 1989.
Net sales for the quarter were $81.4 million compared to $98.8 million for the like quarter last year. The net loss was $5.4 million compared to net income of $.9 million. Net sales for the nine months were $253 million compared to $300 million for the like period last year. There was a net loss of $1.8 million compared to a net income of $12.1 million for the like nine months last year.
Sam Tramiel, president and chief executive officer, said "This has been an encouraging yet difficult quarter for Atari. Towards the end of the quarter we began shipping many new products which represent our future. For example, we started shipping Portfolio, our new hand held MS DOS command compatible computer, and the Megafile 44, our new removable media hard disk drive. Also, during the quarter, we began shipping the STE computer, an improved version of our core ST product. Additionally, during the fourth quarter, we expect to start shipping Lynx, the new hand held color LCD video game system. However, to reflect the dramatic drop in component prices, especially semi-conductors and disk drives, the company has taken a special charge during the quarter of approximately $10 million in respect of such inventory."
Tramiel also stated, "With the shipment of new products and less volatile DRAM costs in the fourth quarter, we anticipate normalization of margins as and when the inventories of older products are sold. Portfolio production is ramping up now as planned. Initial sales appear consistent with our expectations."
Atari Corp. is one of the largest companies in the world manufacturing personal computers and video games systems. Atari headquarters are located in Sunnyvale.

ROM 8 Does NOT format 1:1 successfully... sure it will run.. if
a 57K/sec DTR is satisfactory for you !

The older ROM 7 drives (hard to find these days) will format 1:1
and give you about 550 K/sec.

Seagate recognized the problem with ROM 8's and, I believe,
successfully rectified it. I vaguely recall reading about a ROM 12?

Perhaps someone else can fill in at this point, as i dropped
following the Seagate drives when i ran into the ROM 8 problem
last February.

2970. PROG-A16 being moved

Newsgroup: comp.sys.atari.st
Date: 1989-11-16 21:35:07 UTC
From: SOFPJF@UOGUELPH.BITNET
Message-ID: <8911170807.AA23275@ucbvax.Berkeley.EDU>
Source record: 246992

The BITNET-addressable list that contains the binaries posted in
INFO-ATARI16 (very few these days, more on that later), is being moved
to LISTSERV@UOGUELPH. The CANADA01 node has been moved to University
of Toronto.

I started PROG-A16 2 or 3 years ago to archive binaries posted to
the discussion list. It has served a purpose during a time that we
were all very hungry for programs. The binaries are no longer being
posted, and I guess I'm not as 'hungry' as I ued to be. I used to
put UniTerm on it whenever Simon sent me a copy, and I had a few
other 'feeds', but lately I've been rather lax about keeping new
programs up on the server (sorry).

There have been other BITNET-addressable servers around, but they
were either sparse (SILMARIL@FINHUTC) or 'wierd' (ATARINET in Texas,
that only listens to 'messages', which is OK for people directly on
BITNET, but only if all nodes between you were 'up').

Lately, of course, there's the excellent Panarthea (Thanks SG!), which
is a complete 'mirror' of the mysterious (to us RSCS'ers) comp.binaries.st.

I see little future in keeping PROG-A16 running, unless it is as an
'echo repeater' for Panarthea. (I've lost Steve's address, so I hope
the rest of you don't mind a small personal here...)
Steve, If you read this, what do you think of this idea? It would
offload your machine somewhat, but I have no idea how busy it is.
I could set up the server so that it archives all files you send to
PROG-A16@UOGUELPH.

For the rest of you: Any comments? Please reply direct (I repeat:)
Please reply direct: SOFPJF@UOGUELPH.BITNET or SofPJF@VM.UoGuelph.CA

Well, looks I'd better go try it again! I've already had a couple of rounds at it, but I'm still missing something.

I am using ICDBOOT.PRG 4.2.0. I have tried disabling all my AUTO programs and ACC's. I tried disabling the boot program's cache (this previously allowed me to use TURTLE with ICDBOOT 4.1.8 in TOS 1.2).

I will have another go at it tonight. I'll try all the above again, and then try going back to earlier versions of ICDBOOT. Guess I'll even try booting off of floppy. Something's gotta work!

I heard this rumour so I sent email to Art Leyenberger, one of the
people involved in Analog, and he said that the rumour was true and that
even though they did the dual format, that Larry Flint (the owner of Analog)
decided that the December issue would be the last for Analog/Stlog.

> that you can also use only the FIRST four colors.

Serious question.. Which four colors would you expect?

> These are supposed to be 0=black,1=white,2=red, and 3=green.

They normaly are...

> Not so, in fact 0=black,1=white,2=green and 3=blue. Anything else
> returns white. It never occurred to me to just try each color in
> order, big mistake it turns out.
> Anyway, that's the answer to this problem and I am going to call
> Mark Williams and let them know they have what appears to be a
> documentation error.

The color numbers used by the vsf_color function only refer to the individual pallet numbers from the current color pallet, not to some absolute color code. MW should have made this clear in their manual.

The "0=black,1=white,2=red, and 3=green" -are- the default colors. MW also should have made it clear in their manual that these are the "normal" colors you get from those pallet values, not absolute colors. (I'm rather suprised and disapointed in the MW phoneline support if this answer wasn't obvious to them...) If you've gone and changed the default colors (using a control panel or similar utility), then you're not going to get the colors MW listed for a normal setup...

Medium rez allows 4 colors on-screen at a time. Unless you're good with interrupts and assembly language, that's the limit, period... Unless your program alters the color pallet instead of just selecting colors from the current pallet, the colors your program will show on the screen are going to be whatever default screen colors you've chosen to use for your machine...

PS: If you do choose to alter the color pallet, then please take the time to read the default pallet on entry to your program and restore all of the default pallet entries on exit. (There aren't many programs that become very popular that alter the users chosen screen colors without putting them back before exiting...)

2977. BOP questions

Newsgroup: comp.sys.atari.st
Date: 1989-11-17 00:28:30 UTC
From: jg@hpldola.HP.COM
Message-ID: <11830064@hpldola.HP.COM>
Source record: 246999

I recently purchased a used version of the original version of
BALANCE OF POWER (Thanks, peter!). I'm very impressed with the
game but a have a few questions which are not dealt with in the
manual:

1) The game appears to be copy protected, at least none of the
copys I made ran, they all bombed. It runs fine from the
original disk. Has anyone made a backup or do I have to run
from the original?

2) If I have to run from the original, then I should probably
keep the original physically write protected, right? If this
is true, then I have a few questions:

a) When the game starts, it tries to write a file to the disk,
since the disk is write protected, I get the "cancel retry"
dialog. At this point I can either cancel at which point
the game seems to proceed normally, or I can switch disks
at which point the game writes a "SAVEDGAM" file and continues.
Which method do you use?

b) How can I replay a saved game if it is on a different disk
than the game itself? I've tried choosing "load game" in the
BOP startup screen, but if I switch disks before pressing
"load game" or after, the system seems to lock up,
any suggestions? So far I cannot replay a game as there is
not enough room on the original disk to save a game (even
if I did feel safe removing the write protection on the disk).

c) There is a a:\a\savedgam file on the game disk, is this
somehow involved in saving games (if so, what a poor name
for the file!).

3) Often, when I try to get "history" on a country, the system will
crash with three bombs (address error). Does this happen to everyone
or is it my configuration (1040STf, TOS 1.0, fatspeed.prg, foldr080.prg)?

As I said the game itself is great, it's just the outer shell (copy
protection, no way to replay a saved game, no documentation on how
to replay a game, etc.) that is a bother.

Thanks for any help
Joe Gilray

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,misc.forsale

I've still got the following items for sale:

I still have about 15 Atari 850 interfaces for sale. Includes power supply and documentation (written by myself). Price is $40 plus $5 shipping.

Zenith 5.25 inch disk drive for the ST. It's brand new, includes a data cable (built in) and a built-in power supply. I got a few of these from a friend of mine (he owns a computer store). Also included is a disk containing the needed drive access-time program and a formatting program. If you have PC DITTO, you need a 5.25 inch drive! The drive is only $140 plus $10 shipping.

If interested, contact me through one of the below routes.

From: jheddy@jhunix.HCF.JHU.EDU
Message-ID: <3321@jhunix.HCF.JHU.EDU>
Source record: 246855

The SH204 case will hold a 5.25" half-height hard drive, a type which
is readily available from any manufacturer that makes hard drives. The
drive must support MFM encoding and the ST512 interface. You can use
a 3.5" hard drive in the SH204, but you must use brackets to expand the
form-factor to that of a 5.25" drive; my SH204 had a Tandon TM263 3.5"
drive mechanism, which was in a framework that fitted the drive into
the 5.25" slot provided. Also, check the power supply in your SH204;
I found a 40W supply in mine, which seems to be sufficient to power a
Seagate ST251-1, the Adaptec 4000A SCSI controller, and ASCI-SCSI adapter.
Anything below that wattage is not guaranteed to do the same . . .

>write this note. ...
>This system will out-perform the majority of the IBM hardware
>out in the streets today. In fact the IBM emulator on my Atari has a Norton
>SI rating between 2.5 and 3.0 because of the power of the 68000 (RISC
>architecture). ...
>
>I would further state that it can clearly outperform any IBM in its
>price range for the majority of tasks a home user would want. Do you beg to
>differ with me ? I got my system for slightly over $2000. What do YOU
>own. I'll bet it's 1) more expensive or 2) less powerfull or 3) another
>"toy" computer.

Allow me to differ with you.
A system with:
- A 286 at 12Mhz. SI rating 15.3 Landmark rating 15.1
- 4 MB of RAM
- 66MB 25ms 1:1 interleave hard drive (should tr. at >400Kbytes/sec)
- VGA 640x480 and 16 colors.
- 1.2 Mb floppy, 2 serial, 1 parallel, real time clock etc.
- 2400 bps modem (no advantage here)
- 8 expansion slots (4 available).
- runs multiple DOS sessions under desqview.

costs (1862+100+50+320) $2332 without looking for great bargains.
(advertised items)
It is 1) as expensive and 2) much more powerfull and 3) much more professional.

BTW I own a 1040 ST which was one of the best choices when I got it.
I am using it as a terminal and it is excellent (many thanks Simon!).

Send personal mail only if you want more info on the above AT.

2986. Blitz copy cable and utility

Newsgroup: comp.sys.atari.st
Date: 1989-11-17 08:02:40 UTC
From: U009@CCIW.BITNET
Message-ID: <8911170802.AA22776@ucbvax.Berkeley.EDU>
Source record: 246858

>Subject: Blitz! Floppy Backup available (Advertisement)
>
>BLITZ is a revolutionary new back-up system for the Atari ST computer.
>BLITZ uses ONLY a special cable and software to back-up your software at

I built up the cable illustrated in the original posting and thought I would
send off to the company mentioned for the software, $2.00 and you can't
go wrong, right?
Then on a hunch, I called up a local, major BBS (Canada Remote Systems,
if you must know) and found 2 (yes TWO) versions of the software in the
utilities area. One is obviously the initial version and the other is an
enhanced, Turbo version.

First, here are some tidbits from the .DOC and .TXT files in the archives:

"
" THE HAPPY KILLER
" BLITZ COPIER
"
"
" Are you ready for a $22.00 copier that will copy as good, or in most
" cases better, than a $150.00 cart? Yes?? Well then, Blitz is

The wiring diagram also appeared as a drawing file suitable for printing
with PICSW7:

" ....That's it! Just print out the BLITZ.PC3 or BLITZ.IMG file and you'll
" see how to hook up the printer plug into the drive cables.
"

and...

"=-=
"=-=
"=-=-= =-=-=
"=-=-= INTRODUCING =-=-=
"=-=-= =-=-=
"=-=-= DUPLI-TWIX BLITZ ST DISK DUPLICATOR =-=-=
"=-=-= =-=-=
"=-=
"=-=
"
"(The following product was introduced and demonstrated at the
"WAACE DC AtariFest, October 7-8, 1989.)
"
"Are you tired of running ProCopy or ACopy on your latest $39 or

"$59 program or game only to find that you can't make a backup of

and...

"Magic Media Research in conjuction with 1st STOP Computer Systems
"Ltd is gearing up for production and distribution of the fastest,
"most reasonably priced disk duplicator for the Atari ST available
"anywhere!
"
" What does it do?
" ccccccccccccccc
"It copies disks. Fast. Copy protection and all. It even copies
"some disks that the Discovery cartridges have trouble with. Our
"Discovery cart took 15 minutes and 40 tries to back up our
"Populous disk. It took DupliTwix less than half a minute! Our
"Discovery cart wouldn't back up our Batman disk at all. Dupli-
"Twix did it in less time than it takes the ST to format a disk!
"
"Sorry, but you can't put Mac ROMs into DupliTwix (OK, Dave?).

Well, it does what it says... I backed up my copies of Populous and
Bloodwych in 25 seconds each. And they booted immediately.
To be honest, Populous duped with the first? version of the program
but Bloodwych wouldn't, so I used the Turbo mode on it. That worked fine
(and was faster too). Populous was tried on the Turbo mode and it too
worked fine.

One minor hitch with the turbo software: it takes a long time to exit
back to the desktop. The disk directory windows re-open quickly but
no files are drawn into them for quite a while. I thought it had crashed.
I am running a .5 MB 520 with a Supra 20 hard drive.
It's not much of a problem, though, because you usually want to disconnect
the drive and reboot to check the backup anyway.

I took a good look and there appears to be no licencing or restrictions on
re-distribution, so the software could be uploaded. I would check on any
local BBS's first, also GEnie or C'serve. I will go back to my archives and
read the suggestion about submissions on the BITNET side and follow up. In
the meantime, If you are seriously in need, I could E-mail a UUEncoded
file to you (too many requests might clog us up, though... one hop to the
main nodes is only 2400 baud). If you are asking for the file, please
indicate if you would be willing to re-mail for me if I send you a net
name and address.

PS the original posting showed a 36 pin plug for the printer output
port. It is a 25 pin plug but the pins are numbered correctly... pins
26 - 36 don't exist. The listing of interconnections is right, the
assignment of colors to the plug given is numbered right but positioned
wrong. The drawing file in the archive is correct.

Source record: 246859

Hello all,

... good news for nen-German speaking Turbo C fans!!

I called Borland Germany last friday and talked to the coordinator of
Turbo C beta testing. He said that Borland Germany still has no plans to
offer Turbo C/ST in the USA (I didn't ask why :-). But they are currently
looking for a British or US publisher to produce an English version of the
manual, so that they can offer an English version of the Turbo C package.

I had offered to organize a bulk order of Turbo C and ship it to the US,
and a few people said that they'd be interested. My offer still stands, but
I now propose to wait until Borland Germany comes up with an English version.

What do people think? In the past, Borland Germany has kept such announce-
ments, so I guess one could trust them to deliver in this case as well.

If you don't want to wait and still want a German Turbo C 1.2 *now* or
the much-improved 2.0 in January (?), feel free to email me.

Note: I'm sorry that I haven't replied to all ppl interested in TC,
I'm currently being flooded with email. I have noted all your names and email
addresses, though (if your mail ever reached me :-)

PS: Ignac Kolenko, how the #3!! do I get email to you????

I am halfway in adding a second mech to my SH205. Unfortunately it is not as straightforward as it seems:
1) It does not fit easily (just a cm missing)
2) The powersupply will not spin up both disks simultaneously (50W, 1.6A on the 12V is not enough for 2 Tandon TM262). Got another one.
3) I get weird errors and a hung-up bus as soon I try to access lun1, even without the second drive attached.
Can anyone offer any help? The same set-up worked fine for a friend with an SH204.
Thanx a 1.D6,
Geert Jan van Oldenborgh

Source record: 246863

I've spoken with Mark Williams tech support a few times. One thing that came out was that the minor version number x in MWC 3.0x indicates distribution channel, not software differences (I'm not exactly sure, but I think 3.05 is software store, 3.06 is upgrade from version 2 and 3.09 is direct purchase from Mark Williams Co). Other than that, their manual is full of enough errors and omissions to choke the net repeating, but very few of them are real show-stoppers. The solution is to let them know when you find one, and NEVER to use only a single source for documentation on TOS (which is where most of the mistakes are).
I strongly suspect that the effort needed to produce an ANSI compliant MWC would be within the capabilities of the company. It's mostly a question of whether they could make a worthwhile amount of money on it. I would almost certainly purchase it, even as a new compiler rather than an upgrade, and even with GNU C available. Another thousand people as crazy would probably be a good start.

Now now now, let's be patient. This is what I read in a UK mag. I know the STE is out already in Europe and not available here. The announcement will be made in Feburary. If you have better information then share it with us.

Considering that Atari Corporation refuses to tell me ANYTHING about these boxes, it shouldn't be surprising that a lot of vapour is floating around. Quite rude too.

Since I posted the article on the STE I've discovered that it is really much more scaled down than the TT. Apparently it will have a mere 1 meg internal RAM with a better colour pallete and an 8-bit PCM sound chip AND SIMM slots... APPARENTLY. Who knows what Atari will announce.

> and write floppies (Spectre and Mac format with a Translator-1)
> without problems. It appears, however, that there is a problem on the
> Atari side under GEM. If I try to copy files to the floppy, the system
> will most often re-boot (like I hit the RESET switch) at some point
> during the first file.
>
> .... info about power supply deleted ....

and from some email I sent to glk3593@iuvax.cs.indiana.edu

> ..... It might be that my
> TOS (quite early) doesn't support >1MB properly. I am expecting the
> V1.4 TOS ROMs soon and if it makes a difference, I will post to the net
> and probably directly to you.

Well, the 1.4 ROMs arrived and after installation, the system acted
exactly the same. Spectre operations worked flawlessly while desktop
copies under GEM bombed quite reliably.

I recently opened the 1040 again and removed the high 2 MB bank and
re-enabled the old .5 MB bank on the motherboard. The problems have
apparently completely disappeared!!!! I copied >80 small files to a
floppy (till it errored out because it was full!) several times under
the desktop on GEM and the Spectre operation hasn't given any problems
either (except for the reduced memory size).

Might I ask if Mr. Pratt and/or Mr Townsend might enquire of the
'hardy boys' (thanks Tracy) in the back room if there was an early
problem with the MMU which might have shown up at exactly 4 MB of
memory (an off-by-one error in the decoding or something)?

I'm thinking of re-cycling the 1040 (sans extra memory) thru the
classifieds and looking for a current model if there isn't a simple

chip swap fix.

Is this a crock of S*** or what? Somebody starts talking about making a board that will help the ST and what happens ... somebody starts jumping on him for having vaporware !!! Gees, the guy has just said is is going to consider do something ... he hasn't even said for sure that he will do it and he gets jumped on.

Be real, at least give the guy a chance ... if you want another product, go for it - no problem, but don't jump on Dave. He's trying to do something positive for the ST. He has a proven record of succeeding at what he tries also.

Dave --- keep up the good work, the ST needs more people like you !!!

mike

>Anything below that wattage is not guaranteed to do the same . . .

I upgraded my SH204 to 100MB more than a year ago. I replaced the
Adaptec 4000A controller by a 4070 RLL controller, removed the Tandon
TM262 20MB MFM disk (and sold it), and put in two Seagate ST157R 50MB
RLL disks. This all fits just about into the SH204 case. And I didn't
encounter any problems with this setup or the power supply so far. The
only problem I had were quite some bad blocks on one of the disks, but
that's a whole different story ...

2998. another type of editor

Newsgroup: comp.sys.atari.st
Date: 1989-11-17 18:17:00 UTC
From: BD05@DKAUNI2.BITNET
Message-ID: <"89-11-17-10:17:19.70*BD05"@DKAUNI2.BITNET>
Source record: 246870

Hello all, I want to check if there is a market for another editor, or better: an EDITOR and SHELL in one program (64kB). It looks very similar to NEWLIB running on top of TSO on IBM mainframes at DESY (the best editor/shell in the IBM mainframe world I have ever seen). Since most of you won't know this one: it looks still close to XEDIT under VM/CMS, or KEDIT for compatible PCs, or (but only slighly) to ISPF/PDF. It has a line number field at the left, linecommands, powerful editor commands like ALL, EXCLUDE, OVERLAY, SORT..., it has variable tabbing, zone-selection, various find-modes, it offers fast(*) parallel editing of large files, use of ALL 255 displayable characters in the ST-8bit-ASCII extension, execution of PRG, TTP, TOS, WEX (exec or "batch"), many shell commands like RESHOW, DIR (fullscreen!), CD, MD, ERASE, RENAME..., 64 user-defined function keys and/or custom commands, 26 programmable keys (for any keystrokes), and it works around all those nasty bugs in TOS 1.0/1.2 without you noticing it. It also has many "little goodies", like keyclick-control, screen-invert, hex-octal-decimal text display, hex-input, continuous size-display (lines/kB/free RAM), key-status display (CAPSLOCK, INSERT...). However, I didn't find a place where the mouse could be helpful. Finally, it allows flexible custom exec-files: I use CLG to make an executable with LASER C, or TEXD to invoke TeX with german hyphenation, or UNCR to remove double-CR's and trailing blanks produced by our KERMIT, or ABKSORT to sort abbreviations ignoring punctution and case, or FILEL to list a date/time ordered directory, or FIRSTWORD to invoke 1stWORD in its proper directory holding the RSC-file, or PLAY to invoke any of the games installed on my harddisk, or UUDEARC to invoke UUD and ARC consecutively, or ARCHIVE to ARC a whole subdirectory and copy it to disk, ... (just a subsample to illustrate what can be done).

(*) It comes close to TEMPUS in most functions, except for screen display, which takes 0.3 s for one completely new screen on a SM124 monitor--but 3 screens in one second is sure faster you can read, and reaching line 16000 of a 32000-lines-file takes no more time than advancing one line.

Now my question: Is there any interest in this product, except by me (of course I wrote it to satisfy all my demands, but yours may differ)? Would you buy it? At what price? Or is everybody happy with EMACS-like editors or mouse-editors and Gulam or the Desktop? Any suggestions how to get it out with a useful manual (it would be of no use for you without manual, except for the basic features all other programs offer as well), in a reasonable time, although my spare time for this project is very limited?

if you feel addressed, please reply via E-mail

Roland Waldi, bd05@dkauni2.bitnet

Yay, I got Turtle running last night. The problem was the DOS/FAT buffers in the ICD boot program. Once their size was set to 0, everything ran fine. This lines up with reports of conflicts with CACHENNN, which also uses DOS/FAT buffers.

Thanks for everybodys' help on this!

>If I used BASIC I would probably be happy with it. (I must say, way
>back when I got my 520ST in what, '86 I guess, ST BASIC was a real
>disappointment.)

Well, GFA is currently one of my 2 regularly used languages (assembly w/
Assempro the other). The editor is, quit simply, the best I have ever
used on any system, for any language. I have used a lot of editors in my
time (vi, EDT, EMACS variants, ...), but I now find the
autoindenting, syntax-checking, atuo-capitalization indispensible. The
language is pretty good, too. Buying the current revision is a good
idea, as it has a CASE, and supports more variable types (byte, short
int, etc.) The ability to import ASCII is nice too (I have a few tools
which output ASCII for importation). It's rather fast as well, and there
is a compiler which is fairly good.

I wouldn't reccommend it for professional projects, but it works well as
a prototyper, or for those throwaway programs which are needed quickly.

>on this or another package?

>The price I've seen is about $40 from MicroTyme. I know these folks are
>good, and the price looks right.

I use Assempro regularly, and have done so for more than 2 years.

The assembler works quite well, compiling anything I gave it easily.
However, my style is not common in that I seldom use include files of
the C sort; that is, lists of equates and defines. This style works well
for Assempro for 2 reasons: 1, the included macro libraries are not
worth the effort of using. I think that the author produced libraries
for his own use, and I find them useless. 2, the debugger can't tell
which name you equated to a number very well. It appears to use the
first occurence in debugging, which can be confusing. I generally use
include files for logically related portions of source code. I would
reccommend it as it appears to be one of the most inexpensive commercial
assemblers around, and works well for the price.

One warning: it uses a few constructs which are not Motorols standard, I
think it's the directives for setting portions to even addresses, but
I've had no problems.

I must agree with Dave, I and several of my friends here in the Houston area have the Tech Specialties memory upgrades and have been VERY happy with them. The only problem that I have run into was a bad clock board on my first board which my dealer replaced on the spot.

>enough to understand the magazines. Thanks in advance.

While I don't know the details for any of the paper-based magazines from Europe, I _can_ give you information on a disk-based magazine from Europe, called ST News.

The latest issue, volume 4 number 4, contains a lot of text resulting from a 3-week tour the editors made of England's software houses (and some other programmers in England). It also has about 30 minutes of computer music AND 4 demo programs (as well a couple of graphics ...) One of the demos is a 4-voice digital synth, another is from the designer of Tower Topple (I *think* that's the U.S. version title) -- a "preview" of another game the programmer is working on.

Generally, articles on the disk include reviews of European software, hints for some adventure games, and minor to major technical articles on programming -- for example, the past 4 or 5 issues included tips on including music in programs and working with some of the graphics that are used to create demos.

There isn't a subscription, per se. I arranged with the editors to provide copies of ST News to folks in the U.S.A., and have all back-issues currently available. I've posted the information several times in various places, but have never seen much response.

Anyway, to get the latest issue (the 25th "anniversary" issue, vol. 4, no. 4), you can send a blank double-sided disk and a STAMPED, self-addressed envelope to:
David Paschall-Zimbel, P.O. Box 13038, Minneapolis, MN 55414

If you prefer, our local user group will send you a disk (and notify you when the next issue is available) for $3.00. Part of the money pays for the disk and postage, and the rest is split 50/50 with the editors of ST News to compensate for the expenses they have in producing the disk in the first place.

I didn't see any other replies, so I'll post briefly what I saw.

The booth is in the West Hall; it seems like it's near where past Atari booths have been. It's not huge, but it was pretty good sized.

I didn't see everything, but here are the things that stick out:

* Spectre GCR, running on a Moniterm Viking monitor. Very nice. It also was running from a removable cartridge. This is the area in the Atari booth that seemed to attract the most attention.

* There were a number of TT systems, running simple demos mostly. (It reminded me of those early days of the 520 before there were any real programs). The CPU portion was a small flat type box, with some humps on it. They all had color monitors, many of which were really blurry. The package isn't as ugly as I had heard; it looks OK. It was hard to tell the real performance with just the demos running.

* A European company was showing an "Industrial Mega". They have basically put a Mega on a couple of small boards and packaged it for an industrial card cage. The guy said that it costs about $2000.

* There was a demo of PageStream. The output looked nice, but I really don't know too much about the program.

* An assortment of CAD programs were shown, nothing that really stood out. They had a pen plotter hooked to one of them.

* A few DTP programs. Usual stuff.

* Turbo16. Fast.

* SGSnet. A MIDI based network. I have this now. It looks pretty real. MIDI isn't very fast, but it does seem to work pretty well. It uses BNC type cables between nodes and has a box at each node which connects to MIDI. $169 for 2-user and $109 for each addl. node.

* JRI was showing GenLock and other boards. John now has a board with GenLock, 4096 colors, and some other stuff all in one. He was also showing a setup for GenLock directly on your color Atari monitor. This looked really nice.

* Some games were also shown. I didn't look that close.
One was another F16, one was a Ferarri driving game.

* MIDI stuff - the usual as far as I could tell.

The general mood regarding Atari around the show was sort
of glum. It's hard to describe. It seemed like a lot of
people were looking at the Atari booth as if they were looking
at somebody lying in a hospital bed with a terminal disease.

There was a get together put on by Atari Wednesday night.
I must say it was very nice. They have a new guy (well
actually a couple of new guys) - big surprise huh?

One of the new guys is handling Developer support. He
gave a speach saying how he knows things are bad and that
they are going to be better in the future. The thing is,
it was a little different than some of the similar speaches
made in the past. They mentioned specific things they
are going to do and the new guy Charles Cherry seemed a
lot more sincere than Sig ever did. I will still wait for
actions to back up these words - but I must say I am a
little bit encouraged by what he said.

I went to my local dealer minutes ago to get a
laser printout.

While waiting, the owners of the store called from Las Vegas,
having spent the last several days taking in the new products.

The TT? The owners said that Atari made a very bad
move by displaying DESKSET II (?)... in their words,
it was "dogmeat"... "very slow". They said it didn't make
a good impression, obviously.

Furthermore, ATARI would NOT give a release date. All they would
say was: "It's available in Canada and in Europe."

Another vote for Dave Small and Jim Allen! DO IT !

And Greg L, you're right, all the bashing in the world
won't change a thing.. particularly when dealing with ATARI..
they really don't give a damn.

Scott Settlemier mentioned that his drive (floppy a:, right?) keeps spinning after boot up.

I have a vague memory that someone mentioned that this was a bug in TOS (that happens when autobooting from HD) and that it was fixed in TOS v1.4.

The way that I get around this problem is to access the drive in my profile. So that when msh comes up the drive is read and stops spinning after the read. I just do a "ls a:\" at the end of my profile.

I know that this is pretty Kludgy, is there another fix/workaround?

OK! OK! So I got some facts wrong. Almost every statistic I mentioned was in some way or another half-way remembered from articles from magazines, but I'm not going to bother with the particulars. Anyway, the point of the posting was apparently missed. The point was that some people are making it seem like Sam T. et al are purposely trying to destroy Atari. What I was saying is that this is ridiculous. Who in their right mind would want to destroy something that they have spent so much time on? About the negative comments...Why would Atari want to support people who bitch about them all the time? Think about it. Anyway, enough with the bickering. Oh, and by the way, BoBR, if I said anything to upset you, I'm sorry. I just don't like it when people criticize something that I spent so much money on. I've got friends with Macs and IBMs who do that :-).

If you could read German, you would have noted that changing the resource
file is explicitly forbidden. At least it was in the first version (I will
look in the current).
--
Piet* van Oostrum, Dept of Computer Science, University of Utrecht

Sorry about the odd way of quoting. I'm learning a different newsreader, but
anyway, this is now saj speaking.
I interpreted the notice the same way as Piet did. I said something about
it to a native German friend, who couldn't understand what I was talking
about. He re-read it, and said that he could see why I read it that way, but
what it meant was that the authors of the compiler were absolutely not going
to provide translations of the documentation or the resource. Of course
he's a pretty cheerful fellow by nature, but unless another German says
otherwise, I think what we have here is an idiom.

3018. 360k floppy

Newsgroup: comp.sys.atari.st
Date: 1989-11-18 04:53:47 UTC
From: vicc@unix.cie.rpi.edu
Message-ID: <1989Nov18.045347.26261@rpi.edu>
Source record: 246889

Well I got my 360k floppy working - sort of. The Atari reads the drive just dandy, but it wont write worth a damn (except to the directory)

One porblem it took me a while to discover, the external drive must be on when the ST boots so that it recognizes it.

A previous poster mentioned a program PCF554.PRG which would be necessary to use 360k, where can I get this? I can ftp but some us-snail method would be better (Ie if a pd sw house sells it for $5-10 that would be best since I must call long distance to get to the net. I would be willing to mail someone a disk w/return postage also.

3020. COMDEX (long article)

Newsgroup: comp.sys.atari.st
Date: 1989-11-18 05:15:50 UTC
From: uace0@uhnix2.uh.edu
Message-ID: <904@uhnix2.uh.edu>
Source record: 246891

Well, I just got back from COMDEX, and all I can say is that things look really good for Atari in 1990.

I just read Dave Beckemeyer's post, and he pretty accurately described was displayed in the Atari area. (I wish I would have known Dave was there so I could have met him...)

However, I was extremely impressed by what I saw. The TT is *real* altho not many exist right now. It is blindingly fast in disk access, the screen redraw looked as if Turbo ST were installed, but of course that doesn't work on the TT. The graphics demos they showed were cutesy - a 'monocle' program that showed a digitized picture of Dave Staugas with a mignifyong glass going over portions of the picture magnifying it as it passed over. Cyber Sculpt was running on it and apparently had no problems. It ran very fast.

The graphics modes looked really nice, and the resolution really added to the perceived colors. I poked around on the hard disk connected to the TT, and found a fractals program. This baby flew! Fractal geometry is inherently slow, but this thing really zipped along!

On the back were the plethora of ports, SCSI, ASCI, CENTRONICS, SERIAL, monitor,disk drive. On the left side were the cartridge port, midi, and the SEC (low speed LAN) port (which was in the shape of the Apple serial connector). I can only assume that it was connected to the SEC chip (as the Apple has), but Antonio Salerno (VP of product/developer support) wouldn't comment on it. He just said that when we get ours, we should hook it up and see what happens... (When we will get ours, we don't know yet...)

I liked the TT, and the case wasn't nearly as bad as I had thought, even after seeing pictures of it in verious mags...

I want one, and it is a very nice machine! $3K would include the hard disk, which is (according to Charles Cherry) is designed to be able to 'pop out' and be replaced with another. The cover over it apparently pops open some how. We couldn't get it open, but we didn't try very hard.

The STe was there. Nice display, and very nice stereo sound. It only had a game running on it, and when I was looking at it, Dave Staugas came over to put a new one there... It looked the same as a 1040, except that it had two jacks on the back for right and left stereo sound, and two additional joystick ports on the left side. How many colors were being displayed in the game? I don't know, but the sound was very excellent.

STacy looked good. Several of them there. DeskSet II was being shown, and apparently is a finished project. According to Elizabeth Shook (who displayed DeskSet last year at COMDEX) it was a pet project of Leonard Tramiel, and is quite done. They had a real box and everything there...

The IBP industrial mega component system was extremely impressive. It features plug in boards (one board is a complete mega) that fits into a chasis that has VME, EUROBUS compatibilty. The system is named the 190ST. I was extremely impressed by this system. It looked very respectable and industrial.

The Atari booth was very very nice. Much better than last years display in the Gold Room. As soon as you walked into the West hall, you saw Atari, and couldn't help but see the Spectre GCR. The overall feel was much better than last year, and very professional feeling. As far as the overall feel of Atari at the show. I had no way to judge that. People already associated with Atari had the usual remarks.

The LYNX was not displayed because it was not a computer system (sob sob), but I did get to see it at the developer's party Wednesday night. Sam Tramiel had one in a bag he was carrying, and just as he was showing it to some press people, I walked up to get some food (sneaky, I know). Actually, I didn't know he was showing it, but found out when I got up there. The LYNX is a really neat gadget! The color is great, the sound is great, and he was playing it like a pro. He said that 100,000 were going to ship at the end of the month to New York, and it would retail for $169. I'd like to get one, but it has no real merit for me. He did say they expect to have millions made next year.

The new person at Atari that will be helping developers is Charles Cherry, a looooonng standing veteran of the Atari world. Charles has been using and programming Ataris for at least 10 years (since the 400 came out). I have had dealings with Charles when he worked at Antic (until the beginning of this month in fact). He is quite a guy, and very competent. He is the right person to be in charge of developer support. I had the chance to talk at length with Charles Wednesday, and he really made me believe that good things were happening at Atari. Frankly, I believe him. He has always done me right with my dealings with him at Antic.

Among the things announced for registered developers was all Atari hardware for 50% off! This is significant. He also said that he hopes to coordinate developer efforts, and get them in contact with companies that could help them along. He also plans on having a monthly newsletter that the developers themsleves can use to write and discuss issues in. Also promised were the complete userbase listing for Atari registered owners for specific direct mailings.

This is a few things promised to help the US developers. Charles had been refusing the job for well over a year before he finally accepted it. He said things were finally to the point that he wanted to go there. Everything sounds excellent to me, and I believe it will all come about. Albeit, things will be slow at first, and it will take the sincere effort of developers to help out, but in my opinion (and I have never been really impressed by Atari's past promises or efforts) 1990 is going to be the year for Atari. I predict a strong surge in the US market, but of course, this depends on their getting the STacy, TT, and (leastly) the LYNX to market.

At the party Wednesday, Sam said honestly, that both were being held up by the FCC. This I can believe.

Overall impressions of COMDEX 1989 for Atari: I'm not gonna sell my ST, I'm gonna get a TT, and start developing new stuff for it. Atari is finally serious and finally has competent people in the right places.

I also got to meet Ken Badertscher and John Townsend. Both fine fellows!

After last years COMDEX where I didn't feel any strong good feelings about Atari, this year I am enthused once again! Atari is gonna come back (I hope).

- mike vederman

The opinions expressed are my own (but the other people that went with me were equally impressed!) and do not necessarily reflect any other persons feelings, dead or alive.

Well, the STE is only a ST with those additional features you mentioned.
It certainly doesn't have a 68030, as you earlier mentioned!

Written Nov 17, 1989 by mitsolid@acf5.NYU.EDU

A system with:
- A 286 at 12Mhz. SI rating 15.3 Landmark rating 15.1
- 4 MB of RAM
- 66MB 25ms 1:1 interleave hard drive (should tr. at >400Kbytes/sec)
- VGA 640x480 and 16 colors.
- 1.2 Mb floppy, 2 serial, 1 parallel, real time clock etc.
- 2400 bps modem (no advantage here)
- 8 expansion slots (4 available).
- runs multiple DOS sessions under desqview.

costs (1862+100+50+320) $2332 without looking for great bargains.
(advertised items)
It is 1) as expensive and 2) much more powerfull and 3) much more professional.

/* End of text from mitsolid */

Yes, but do you have MIDI ? Just kidding. I certainly do stand corrected about my presumptions concerning the Atari MegaST being more powerful for the price than any comparible computer. I'm afraid all I can plead is ignorance. I had no idea the price of 286 computers had dropped to such a reasonable level. It's a welcome development, even though I am somewhat of an Atari loyalist (because I liked their philosophy or not ripping the consumer off every chance they get). It seems that I have fallen behind, and times are changing rapidly. Atari has done a couple of things recently that may be loosing them some of their loyalty base now. I like to think I have an open mind, and I have to admit that factual arguments like yours are very convincing. I hope Atari believes enough in PR to refute your (implied) claim that their power/price ratio is down (with a market announcement that actually comes true or something), but intuition tells me they won't. I'll stop here because I would hate to become an Atari-basher. I still have hope for them. I'll always welcome reasonable arguments and facts, though. So thanks.

Bob Krieter

3024. Re: MWC errors (was Re: GEM help ne

Newsgroup: comp.sys.atari.st

Source record: 246896

I tried to mail you this, but it gave me the line below
554 covertr@force.uucp... Service unavailable: Inappropriate ioctl for device
Since I have mailed to others, I assume I did "the right stuff" at my end.

So here goes:

----- Unsent message follows -----
I think most of the people on the net are aware that Atari is
handling the marketing/support situation very poorly in the U.S. probably
because of their European concentration. Atari is also aware by now of
how we feel, if they even read or care about this notesfile anymore with its
childish sounding bickering.
I accept that you have Atari's interests at heart, and am glad
you feel it is worth your time to write the long notes (seriously).
However, bringing up MWC'S loss of performance to show that the Atari's
market is going down is redundant. We already know, and they know it too.
I get to use this net for free, but if I didn't I would probably get upset
about downloading all of the repetitive (Atari-bashing) messages at long-
distance costs. Some people may not have the extra money to spend. I don't
have that much extra time to spend, but it is only slightly irritating to skip
them at a couple seconds loss. I purchased Mark William's C also, and would be
especially interested in an ANSI compiler which I could use at work. But
a brief announcement that MWC ANSI "C" isn't out would probably have been
sufficient.
This is my opinion, but I think straight facts will recieve warmer
attention than (few facts)+(gobs of repeat opinions). That is my official
opinion on opinions :) You did make some good points, but please let it
rest until there are some hard facts (and then moderate the volume of opinions)

BTW, the lines on your messages are too long for most of our screens. They
wrap around and leave a lot of blank space on the second line. Please
shorten the width of your window to around 75 or (max) 80 characters,
or increase them to just below 160 for those of us with standard sized windows.

Thanks,
Bob Krieter

>take to put one of these in an ST for 1.4MB floppy capability? Does
>anyone here have access to Western Digital folks for pinouts & other
>specs for this chip?

Well, You want to have an 1.44 Meg drive for the ST?

It's really easy: just switch the clock frequency of the WD1772 to 16
MHz (taken from the shifter) and attach a high density drive (like the
TEAC FD 235 HFN).

Set the seekrate for the drive to 6 Milliseconds (will become 3 with the
doubled clock).

Format high density disks with my little formatter (posted here).

A high density 5.25 inch drive is possible too. But these have no
automatic HD-recognition...

Works well for me.

3026. Comments on STE -- (un)known facts

Newsgroup: comp.sys.atari.st
Date: 1989-11-18 16:13:47 UTC
From: daniel@pkmab.se
Message-ID: <2310@pkmab.se>
Source record: 246898

I have just got hold of my 1040 STE (Friday) and thought the
Net might be interested in some facts, which should be well known.
If they are or not... Well.. Read the following:

What it has

- Smooth one-pixel scrolling in hardware
- Two 8-bit D/A-converters for stereo sound
- RCA stereo output
- Blitter (thanks guys!)
- Six (6) joystick ports [Atari BUSINESS Computer, ha!]
- A palette of 4096 colors. almost useless with the RF-modulator

My first impression is that it could have been better. Much better.
Sure the scrolling is impressing. But the sound... Nah, I've heard
better. The future can't be playing raw sampled sound -- takes too
much memory.

Along on the language disk with handwritten label that follow are two
different demos, apparently written with Turbo C 1.1 (Yes, I've
disassembled them. I had to!) that shows the new capabilities.
Why not put them together, it would be more impressing!

The sound demo sounds good -- but the samplings are boring and really
not that good. You could have done better!

The scrolling demo consists of nine pictures in pattern of 3 times 3
screen where you can scroll softly to any point by moving the mouse.
Nifty!

But, listen now Atari, a large BUT. *No* documentation about the
new chips followed. Not even a list of adresses, not even a little
"read.me" on the language disk!
Why? Don't you want people to use these new features, just the
software houses, or what?

More information follows as soon as I manage to find out. Any
information about the STE can be posted to me. I will summarize to
the net if it's interesting.

[BTW, funny with the hbls in "desktop info"! Not much work, but
it really looks nice...]

>Frank Filz

You can use DC FORMATTER to do the same thing. Just write an executable boot sector to drive A: that has the set seek rate option enabled. From the main menu, just set the seek rate to 6, then go to the executable boot sector menu. Next select the set step rate option, and write out the boot sector to drive A: Now when you boot of of drive A:, the step rate for drive B: will be set so you can read and write to the 5 1/4" drive.

Of course, other boot sector programs can also be written at the same time from the DC FORMATTER executable boot menu.

Source record: 246808

Hi,
I got a problem.
I am using Turbo C 1.1 and it works fine. BUT the assembler and debugger I haven't got working properly! I have tried two different copies of the original disks. The assembler loads, probably loads the program then dies. The debugger works OK, but when I want to leave it, it hangs with a busy bee. I have tested the Swedish TOS 1.0, 1.2 and 1.4, both Aug.'88 version and the final one (that for some reason has some missing scan codes, for shift arrows and some more shifted ones). Probably tried half a dozen Ataris of different sizes. Supposedly it works with the German TOS, so they must do something irregular.
Yeah, another thing. In the TurboC proper, I wonder what kind of writing the editor does in the windows. Often when I am browsing around, it seems to come one pixel row wrong, so it leaves black pixels around. How come?
For the rest I am very satisfied with the compiler!

3041. Michtron's Super Conductor

Newsgroup: comp.sys.atari.st
Date: 1989-11-19 06:34:13 UTC
From: bradr@uwovax.uwo.ca
Message-ID: <4332.25660315@uwovax.uwo.ca>
Source record: 246813

Help please! I saw Michtron's Super Conductor program on clearance in
a store the other day. It looked pretty good so I decided to buy it.
Unfortunately, it won't run. It starts up, begins to draw its gem screen,
then crashes with a bus error. I'm running a Mega ST with TOS 1.4.
What gives? Is this program one of the few that won't run under the new
TOS?

brad

3042. spectrum and quantumpaint formats

Newsgroup: comp.sys.atari.st
Date: 1989-11-19 06:45:28 UTC
From: gng@spocom.UUCP
Message-ID: <15@spocom.UUCP>
Source record: 246814

Some more quick questions - Does anyone have information as to how spectrum and quantum paint programs are able to make the ST display more colours than usual? I'm especially bewildered as to how quantum paint can display 3375 colours or more! Any info appreciated...

3047. STe TOS BUG

Newsgroup: comp.sys.atari.st
Date: 1989-11-19 13:56:55 UTC
From: daniel@pkmab.se
Message-ID: <2311@pkmab.se>
Source record: 246818

Maybe we should make a list of bugs in the new STe's TOS?
I don't know if it has the same bugs as the normal ST's TOS 1.4,
but sure it has bugs!

The most obvious one is that it's impossible to record the
resolution desired in DESKTOP.INF; whatever you save you will always
end up with low rez.

A quick fix for this is to save the desktop on a normal ST. Otherwise
you can get any texteditor and change the #D-entry (I think...) to 13
instead of 12.

I get some funny errors in the screen sometimes, when pulling up and
down the menus. Looks a bit like an old version of QuickST, the desktop doesn't
redraw correct. THis happends both in DevPac 2, UniTerm and the desktop.

BTW, the soundchip base seems to be $FF8900 -- maybe could someone from Atari
be kind enough to post a list of equates for the different adresses,
and the freqs used? I can play a sample right now; but I can't sample
with the right speed! (I'd love to have the MFP setup!)

>get the computer loading a few of the accessories, but then doing a
>cold or warm boot in the middle. It's like someone hitting the reset
>switch during bootup before the GEM Desktop appears.

I went through a phase of that sort of problem, and it turned out to be
being caused by nothing more than a couple of bad sectors on the disk.
The sectors were only marginally bad (misaligned or weak, maybe?) so
they didn't always bite. You might try looking at that possibility with
a disk-checking program.

A boot disk gets a lot of head travel, and since boot disks tend to be
fairly static and always accessed in the same pattern, it is easy to
believe that you might get one sort or another of physical wear to account
for this.

In any case, I solved my problem by the simple expedient of remaking (on
new disks) all of my boot disks which showed suspicious sectors; and I have
avoided the problem since by making it a practice to run a disk-checker on
my more commonly used boot disks once every couple of months. Worth a try.
Sure, your problem might be more complicated, but it's easier to check for
the simple possibilities first...

In article <916@loria.crin.fr>, domen@wiener.crin.fr (Eric Domenjoud) writes...

>I have some questions about GEM:

(even though I don't carry my docs to work)

>1/ How do I put the mouse at a specified location on the screen ?
initmous does it, but I wouldn't reccommend it. Every program I've had with it drove me crazy because invariably my mouse would run out of room, and having to pick it up and put it back down closer to me is bothersome.

>2/ How do I bound the mouse to a box xmin-xmax,ymin-ymax ?

I imagine it could be done by checking mouse position, and calling initmous if you exceeded the limits, but ther is probably a better way.

>3/ What does the GEM function CELLARAY and how do I use it ?
I've never seen it used. Apparently, it divides the screen up into rectangles, each of which has an associated color. When a graphic operaion would draw, the color drawn would be the color of the rectangle in which the pixel lies. I wonder if this function takes over the screen, making it difficult to use other colors? To get around that, if needed another virtual workstation could be used, I suppose.

>that I no longer have MT C-shell vsh, ansiterm, etc on my hard disk (I do
>use some of the utilities from the c toolkit (whatever it was called) with
>Gulam).

I too purchased just about everything from Beckemeyer (about $300-400 Cdn!)
including HD Sentry (I'm planning to also get HD Toolkit from them -
comments on this?). At first, I had problems with installing stuff like
uucp and also some of the documentation is skimpy at times. But luckily
enough, I referred myself to the standard unix doc's from third-party
sources...and it's still on my hd ;-) (but I have only about 5megs left on my
16meg mtcsh partition!)

>...(stuff about skimpy docs deleted)...
>starting multiuser mode, my modem went into permanent off-hook...turns out

>the previous problem, I did an init 1, wanting to go to single user
>multitasking...unfortunately that was single user single tasking, and
>things like piping to lp no longer worked! :-(I was not pleased.),

Hmm...I'm using mtcsh 1.2 and I don't find that 'getty-echoing' (?) problem
you mentioned...yes, the problem of not being about to spool to the printer

when running init1 is sort of dumb...but oh well...I use init2 most of the time anyhow.

>3) generally slow, sluggish feel, 4) a lot of utilities I had come to know and
>expect in a unix-like environment missing (this was really frustrating,
>...

Ahh, but after using Minix for a bit, I immediately went back to mtcsh!
If you think mtcsh is slow (which I believe it really isn't that slow at all) , Minix is even worse (and I couldn't even install
it onto my hd - trashed a 16meg partition in the process - luckily it was empty but I couldn't use it after...but that's another story :-).
Well, I had to do a bit of software-searching on bdt's bbs, other bbs's, and more recently, Usenet and it's archive-servers (atari st, unix, etc) in order to supplement the not-too-many utilities included in mtcsh.

>...and worst of all, 5) the system kept
>crashing when I tried to do almost ANYTHING (ESPECIALLY vsh! This was

Well, for me not really almost ANYTHING but some things! After all, we're working with a 68000 with has no memory protection and some of the regular tos/gem prgs out there aren't really well...programmed well. The only problem I came across in vsh was when I tried to save the parameters of how the windows were positioned/located - it would crash if I tried to boot it up after that. I mentioned it to David and he promptly fixed in a matter of weeks...

>My experience (and what I have heard from friends) indicates that if you
>want a cheap unix-like environment, buy a PC and MKS-Toolkit...this is
>single tasking but does support pipes, etc, and feels WONDERFULLY like
>unix! It has vi, awk, grep, etc, etc--all the things you know and love.

I heard some pretty good things about that also - their ads in Byte also prove mks-toolkit to be very complete and well-thought out...alas, that's in the pc world...we'll have to do with what we have on the ST...

>If you really want multitasking, consider using MINIX (I have friends
>who are having fun playing with it, personally I have never used it on

Fun? Playing with 'that'? :-) No way...as I said before, it's slow and there are installation problems on hd's. It might be
ok for the serious unix hobbyist but not for the guy who wants to use most of his tos/gem stuff (given that it won't crash under mtcsh) and multitask without the hassle of recompiling half of the kernel in order to make things work to some extent....

>an ST so I can't speak from experience here) along with the Free Software
>Foundation tools--c compiler, flex, bison, emacs, etc.

Turns out that flex, bison, and emacs is available for the ST, and it runs under mtcsh 'cause I have 'em! I hear the gnu c compiler doesn't work because of gnu-c not recognizing environment variables declared through mtcsh, but I use Mark Williams C (3.0.5) and it works fine along with those other gnu

utilities.

>These are just my opinions and impressions, I'd be interested in hearing
>what others tell you about their experiences.

I haven't heard from other mtcsh users yet. I've seen some on the bdt bbs
but with long-distance charges cropping up for me as they always are, I don't
usually call bdt bbs that much. Those and other users should be able to
get on some sort of public access unix system and be able to view
comp.sys.atari.st and hopefully share their thoughts...

>(One other frustrating thing was that when they announced on-line manual
>pages, I immediately sent them an order, along with a check. A few
>months later, they sent me a notice telling me that I could be a beta
>tester for the man pages, and if I would agree to use them a predefined
>amount in the next month I could keep them free--this after they had
>my check!)

That's strange...I ordered the online manual along with rtx, vsh, hd sentry,
sds, uucp, and the mtcsh 1.2 upgd with no problems whatsoever....hmmm...

>And on a different note, I was hoping for something like 24 bit color in the TT!
>Does anyone know how many planes the ATW has? (I requested some information on
>the ATW at SIGGRAPH this year, but haven't heard anything yet).

Speaking of graphics, does anyone have more information/address of JRI's 4096
chip thingamajig? Just like how spectrum/quantumpaint is able to pull off
512-3375 (or even 4096?) colours from the regular ST setup, wouldn't it then
be possible to display 4096-27000 colours? (ratio!) Just a thought...
Also, I would like to get the addresses/info. on the companies that produce
add-on graphic boards for the ST - I've heard of one called Image Systems or
something, and one company also in Europe...

>Don Allison
>don@hp-col.col.hp.com
>
>As usual, these opinions are strictly my own, and even I disavow them on
>alternate days!

>Available now...well could you post more info for us non-europeans.
>I'd be interested in seeing some specifics on this..
>compatibility, speed increase, etc

So, here t goes:

The PAK68 is an c't project. c't is a german computer magazine.

Instuctions to build it were published some time ago, together with full circurit description.

compatibility: none. TOS doesn't run; a TOS version hacked to run is not very compatible (why, why did Atari use line-F for anything but floating point?)

speed increase: well, the 020 runs at 8 MHz. The circurit was not designed specifically for the ST...
circurits like Turbo-16, CMI speed or the like were designed for the St, so they can fall back to 8 MHz wherever necessary and run at higher clocks when the async BUS is used.
The PAK68 has support for high speed SRAM on a daugterboard.
But nobody made this availeble to TOS; the custom chips (DMA and SHIFTER) cannot acess it (their adress registers are inside the MCU, so they can only acess the MCU-supported DRAM). And most programs do not like to run in anything but the standard RAM...

overall the speed increase is compareble to any 16-MHz 68000 accelerator for the ST.

With ther german RTOS (nothing to do with TOS!), the PAK helps a lot more, cause RTOS can use the cache, the 020 specific instructions and the 881.

I exspect the Gadgets board to help a lot with Spectre and do almost nothing for TOS. The ST is a closed machine; a compatible, faster redesign is pretty exspensive.
TOS not only does not support processors other than 68000, it fights them :-(

>
>
>--
>David L. Newton | uunet!marque!carroll1!dnewton | The Raging Apostle--

You completely missed my point. I made no mention at all to the '030 for ST
that supposedly runs at IIci speeds. I was referring to the comment about the
TT's 030 running at 16Mhz. Your last sentence is not always true, either.
Look at the current STs, for example. Take the JATO 16Mhz board. Gee wiz, it
runs at 16Mhz, so it should be twice as fast as an 8Mhz ST, right?

Wrong. Other aspects of the hardware limit the speed increase. Drastically.

A 25MHz "doin' bad" can be worse than an 8Mhz doing average.

Mike

Funny you should mention this. When I first got a copy of this program
I had the same problem. Except, I was using a Gemini10X. I could not get
the thing to work with the printer unless I did some fancy formating
with page length and width. Even then it was not guaranteed to work.

What did I end up doing? My brother coughed for a new printer that
is known to work with it. I could not determine exactly if the problem
was in the software or my outdated printer. For all the trouble you are
going through I would suggest buying a new printer. Oddly, I could
get it to work with the Star NX-1000 at the store where I bought the
program. Hope this helps. Has anyone else had this problem with the
older Gemini printers?????

From: zimm@portia.Stanford.EDU
Message-ID: <6832@portia.Stanford.EDU>
Source record: 246829

If you know anything about hard drives, I'm in desperate need of your help!

One of my hard drive partitions is turning into spaghetti. By that I mean that when I attempt to write a lot of stuff to it (maybe 2 megs) the new files are severely corrupted, the directory looks funny, the computer crashes, and so on. I believe that the drive can't write to certain sectors (I recently noticed a <write fail> message from the ICD utilities). What should I do?

a) Should I reformat the partition and hope there are no real hardware problems with the drive itself? As far as I can tell, the ICD utilities won't allow one to reformat a single partition: how does one accomplish this? (I DON'T WANT TO REFORMAT THE WHOLE DRIVE!!)

b) Is there any way of determining which sectors are permanently corrupted, so that when I reformat the partition I can tell the drive to ignore them?

I need to solve this problem a.s.a.p., as one might imagine.

Thanks -

Dylan

steveg@SAIC.COM (Stephen Harold Goldstein) writes:
>Seems to me the people bitching at Atari have no one to blame but
>themselves for not making a more careful decision before buying. If
>the TT isn't what you want, DON'T BUY ONE!

Good idea. I think I'll buy a PS/2 - then I can keep my software investment intact, right ? Or less tersely, many of us feel Atari is holding us hostage because although we could afford (easily) to go to another vendor for a hardware platform, we're trapped by our current software and data. I for one have easily $2,500 tied up in packages which work well, and with which I am happy, except that the hardware platform has been completely outstripped. I can't put a value on the data I have lying around at all - ghods know how many hours I have tied up in that.

So I'm pretty well committed to going with Atari again. Unfortunately, Atari appears to think that this gives them the opportunity to ignore me, and to slant their market offerings to buyers at the low end, without losing the sale, and with no loss to themselves. I don't like that very much - I feel I'm simply being taken for granted. Anyone else out there feel like a captive too ? If I'd gone with Big Blue (ugh) I could get a real powerhouse clone now from any number of vendors and keep my software. This would be nice.

As for Greg Lindahl, yourself, and the rest of the cheerleaders: what's _your_ investment in ST-line equipment? In software? In data that only makes sense in relation to the afore-mentioned software? In hours spent learning the twisties of programming in the AES/VDI/GDOS environment? I'm on the hook for quite a few $$$'s, and many, many hours. I've got a 1040, 85 meg drive, two monitors, jato board, memory upgrade, tons of other stuff, magic sack, I can't even keep track of it all. Have you noticed that many people expressing unhappiness w/Atari have similar large investments? I do not consider myself a casual complainer. Hell, I'm even a registered developer!

I want to buy a real high-end cpu/video section. I don't see it yet; the tt/p comes close but lacks expansion. The tt/x may be it, but it's a little too far away to bank on. I see _lots_ of high end stuff from other vendors that I can't buy because I've already spent my money. Where's my upgrade path, d*mnit?

Just a short PS.
I have found out what freqs they're using. Quite odd ones, really.
They are
6258 Hz
12517 Hz
25033 Hz
50066 Hz

With other words some kind of crystal divided with 1, 2, 4 or 8. Right?

Someone who knows how I can generate an interuppt with this freqs
for my sample-routine? Or will there be a new version of ST Replay and
similar packages? Is patching possible? (Of course it is?!)
What about upgrades?

Think it's time to disassemble NEOWALL now.

I am kinda stuck with finding a color printer driver for a "Star NX Multicolor printer. I have one an have been unable to make screen dumps in color the driver I have is the one that comes with the control panel and must only work on the Okidata color printer as it doesn't seem to work for me perhaps I have messed something and some one could help me out. I have seen a driver for the Amiga and seen it work but nothing seems to work for the Atari for me surely one must exist! I would appreciate if someone could give me hint as where I might find one as their is no offical Atari dealer in our city.

From: scott@cs.odu.edu
Message-ID: <SCOTT.89Nov19231439@oswy.cs.odu.edu>
Source record: 246835

Some more quick questions - Does anyone have information as to how spectrum
and quantum paint programs are able to make the ST display more colours than
usual? I'm especially bewildered as to how quantum paint can display
3375 colours or more! Any info appreciated...

My quantum paint is pretty useless...
I have not seen a conversion program from quantum's own format over to any
other (gif would be best!) and so the images are neat to look at...
on my atari... in quantum paint.... but besides that, they are useless.

Also, my quantum paint screws up the colors whenever I get more than 30-40
of them on the screen at once!
(it does that nasty recalibration and changes the colors from like green
to red!) I have not used my version since that happens to me EVERY time.

[describes how Atari had what he wanted a while ago, but that it hasn't kept up with what other companies have been doing...]

Well, this is a problem everywhere. Talk to all the science types who bought VAXes in 1980 only to have to convert to Unix because DEC wouldn't sell them fast boxes. And then DEC starts making fast VMS boxes again.

>So I'm pretty well committed to going with Atari again.
>Unfortunately, Atari appears to think that this gives them the
>opportunity to ignore me, and to slant their market offerings to
>buyers at the low end, without losing the sale, and with no loss to
>themselves.

Er, the TT isn't really much of a "low end machine" in any configuration. You can't sell millions of home computers if they cost over $2,000. So you have a curious definition of "low end".

>As for Greg Lindahl, yourself, and the rest of the cheerleaders:
>what's _your_ investment in ST-line equipment? In software?

Well, first off, I'm hardly a cheerleader. I've NEVER said that I think the ST is a price/performance winner. And I've never said I thought Atari's marketing policy was good. I've only been playing devil's advocate and pointing out obvious flaws, hoping that the flame war will end.

And, yes, I have a big investment: about 1/3 of my total material possessions is my ST. However, most of the software I use (terminal emulation, LaTeX, Maple, Fortran) is portable elsewhere. I've spent some time understanding GEM programming, but that is useful when I program on other windowing systems. I got what I paid for in the first place.

>I want to buy a real high-end cpu/video section. I don't see it yet;

In article <3795@netmbx.UUCP> hase@netmbx.UUCP (Hartmut Semken) writes:

>I exspect the Gadgets board to help a lot with Spectre and do almost
>nothing for TOS.

Hm. I thought the FaST Tech board was a 16mhz 68000 with a write-through 32k cache. So if you do lots of reading in a row, you get a big win. Now if you essentially mounted a 16mhz 68030 with a 16 bit data path onto the same board, and somehow get around the Fline problem, then you'd have something that would speed things up more than the Turbo16. Right? It wouldn't be as good as a 32-bit data path with no speed decrease on writes, but still better than a 68000 at 16mhz.

Of course, I don't know if the '030 can handle different bus widths. My Moto books aren't that recent.

The way that it wins over the PAK68 is that Jim Allen has partially decoupled the processor speed from the video speed.

> The ST is a closed machine; a compatible, faster
>redesign is pretty exspensive.

But the TT *is* a compatible redesign with 32-bit everything, right? It will be interesting to compare the TT to other similar '030 boxes, when/if it arrives.

/* Written by suhonen@tukki.jyu.fi in uxf.cso.uiuc.edu:comp.sys.atari.st */

Much text deleted intermittently

>The MC68000 is FAR from RISC!!!! It is absolutely a CISC processor!
Not true. See below.

< I am a month from graduation as a computer engineer, and....
>if only I where you professor, I'll would kick you out of the University!!
>Almoust draduated computer engineer, and does not know NOTHING about
>processors... Where is the word goning to?????
Isn't there some sort of error in logic there ? Because I haven't
programmed the 68000 and one of my statements about it was technically
incorrect, I know NOTHING about processors. I know quite a bit about
processors (I won't bore everyone by putting it in). The University of
Illinois is in fact one of the best Colleges in the United states in the
field of Computer Engineering, and I will graduate in December. However,
they tend to concentrate on theory. I have had little experience with the
hardware currently on the market.
I don't see any smiles in your text. If you want to get personal
with colorful insults, then please use mail. Your message is in very poor
taste. There is enough bashing going on here, we don't need to start flame
wars as well, do we ?
I heard about the 68000 architecture from a friend at the University
here (I haven't actually programmed it myself). Here is what he said:
(Note that I now admit the 68000 is considered CISC)

"Actually, the 68000 is considered CISC, because of the fact that YOU, the USER
cannot write programs in its "basic" set. I am *quite* sure that at the very
heart of the 68000 is a RISC ALU which executes a VERY small program (which
is stored in the on-chip memory) which reads the instructions from memory and
decodes them. So overall, the 68000 is in fact CISC, but it is run by a RISC
heart.

And yes, I am quite sure of this. I got this info from a (very informative)
article on CPU architecture in Byte magazine (a special issue on architecture
sometime in the last 14 months or so) -- they were doing a specific comparison
of the basic operation differences between the 80x86 and the 680x0 families."

Hopefully that will clear up any confusion that you or I created.

>architecture).

your posting is an excellent defence of the power and versatility of the
atari st line of computers, but you, especially as a computer engineer, should
realize that the 68000 is nowhere near being RISC architecture. the 68000
has a very complex instruction set, with very complex addressing modes.
(the 020 and 030 have even better addressing modes, but that's another
story). a RISC architecture means the processor has a limited set of
addressing modes, mainly loading into a register and saving from a register,
and they usually have a better file of general purpose registers than what
the 68000 offers. anyways, thanx for actually standing up for the atari st.
it's a real shame that so many people in north america are ignorant to the
power of this machine. i guess it will never die in europe, though, which
makes me feel a little bettter.

try ordering MadMac from atari (it comes as part of their development kit).
it is blindingly fast, and supports standard motorola syntax and standard
comment delimiters (try that with that idiotic mark williams assembler!)
it produces normal dri compatible object files, so you can link them with
Laser C, atari's aln linker, or any dri compatible linker. (again, try that
with mark williams) i don't know how much it costs on its own, but at least
atari canada says that they will sell pieces of the dev kit by themselves.

(btw, i really don't like mark williams c. (it comes with atari's developer's
kit.) don't buy it. the only thing good
about it is their manual and their support. otherwise its slow, doesn't
support standard function value returning conventions (pointers are returned
in D0, instead of A0), and their assembler makes life an incredibe pain.
their dri object file converter didn't accept madmac object files, so
you're stuck using their brain dead assembler. yuck!)

I just thought I'd put in two cents on the pro-Atari side. I started with a 520ST early on, didn't spend much on upgrades or software, just stuck with the oriignal Megamax C and First Word that came with my computer. I wasn't in too deep on the dollars side, but I spend huge amounts of time learning the system. Would I buy another Atari?

Hell yes. In August I spent a pretty good wad for a Mega 2/50M HD/Spectre system. Although I've been developing programs on contract on IBMs for awhile (you cannot use PC DITTO for IBM development), I got a new contract for Mac work, and took a gamble that I could consolidate my Atari hobbiest past with my Mac development future.

I couldn't be happier with my choice. For around the same price as a Mac SE at a college student discount, I got a machine that was a little less compatible with the real Mac world (at least hardware wise) but compatible enough, a little faster, with hardware that's a little better. Technically speaking, the equivilant of a Mac IIci isn't available in the Atari world, but speaking as a serious developer, what do I want with a Mac IIci? The company I did the contract for (an international software and textbook publisher) owns primarily Mac Plusses! Were I running fractals or ray tracing a Mac II or Atari equivalent would be nice, but as a serious developer, I can't say I really need it. Sure, you get faster compile times, but if you can honestly tell me you spend most of your time compiling programs instead of writing and editing them, you either write very short programs or you're a fast typist.

I think I lost sight of the point of this exercize...oh yes. As a developer, I'm not sorry for spending all the time and money I did with Atari so they can "abandon" me and pursue new markets. The more new markets there are, the more money there is to be made for developers. And I can't gripe about the time I spent learning GEM--I went from never having touched a Mac to completing my first program, windows, dialog boxes and all, in about three weeks, and I attribute this to my experience with, and its similarity to, GEM.

Would I run out and buy a TT if they came out tomorrow? Probably not--my Mega 2 serves me fine.

Sounds a lot like 40 folder bug symptoms. If you are not running FOLDRXXX.PRG
(renamed to something like FOLDR100.PRG) the I STRONGLY urge you to get the
program and put it in your /auto folder.

If your ICD driver is V4.x then in place of FOLDRXXX you can configure the ICD
folder limit to be 100 or so (depending on how many folders you have/will have
on your HD).

[Okay, okay. I'll ship COD cash or certified check.]

Atari 1040ST/Spectre 128 System Package $875 firm

HARDWARE
1040STFM without RF modulator, TOS 1.2
1meg DS/DD 720K drive mouse original box & manuals
Z-time internal battery-backed clock (installed)
Atari ST Monochrome monitor
original box & manuals
Monitor Master (color/mono monitor select switch)
Custom cable for Multisync monitor
External speaker
(most multisync monitors have no speaker)
Spectre 128 Macintosh emulator cartridge w/128K ROMs
original disks/boxes/manuals
Translator One floppy disk controller
(reads MFS Macintosh disks in ST drives)
1200 baud dumb modem
(government surplus; manual; needs RS232 cable)
Joystick

SOFTWARE
Atari ST
ST Basic/ST Logo/1st Word wordprocessor (came bundled with ST)
5 disks of PD software (C compiler, assembler, terminal program, more)
Games (all original disks/boxes/manuals)
Beyond Zork (Infocom)
SpellBreaker (Infocom)
Plundered Hearts (Infocom)
King's Quest I
Phantasie I
The Bard's Tale I
Dungeon Master
Macintosh
Microsoft Word 3.01 (original box/disks/manuals)
original disks have been pre-converted to Spectre format
Epstart Epson printer drivers
5 disks of PD software (ramdisk, DAs, fonts, games, sounds, more)

DOCUMENTATION
Abacus ST Internals
Abacus GEM Programmer's Reference
Inside Macintosh
(ancient edition in original Apple 3-ring binders)

30 issues of ST-log magazine
(from the original issue thru about March 1989)
Reams of printout from BBSes containing Atari technical information
(I collected do-it-yourself hardware modification articles, like
adding disk drives, attaching multisync monitors, expanding
memory, detaching the keyboard, etc.)

TERMS

$875 postage paid

I will not consider selling anything separately. Please do not ask.

In Northern/Central Jersey, you can pick everything up or we can
arrange a meeting in some reasonable equidistant location.
Otherwise, I am willing to ship UPS COD cash or certified check.

I haven't run it for a while, but my experience was that it only checked
the original disk when first booted. After that I could swap in a
duplicate disk and it ran fine. This solves your questions about saving
the game, etc.

subject: gulam

I just wanted to send you a note thanking you for gulam. I use
it almost daily and have had few problem with it. I think it is
amazing that you have packed so much flexibility in such little
space. (My only 'complaint' is that I can't seem to change any of
the ue key bindings).
When you have it prepared for final release, I'm sure the atari world
will be grateful for a new posting.
Also, since you mentioned availability of source to a selected few
I would like to be on that list of recipients. I would like to see
if it is possible to call ue from a .g file.
You also mentioned in the original documentation that came with gulam
that there was a book you were working on. Would you post this when it
becomes available?
Thanks so much for making my life a little easier..

>
> Chris Hinton

Two possibilities:

1st: (unlikely, but this should be posted)
Nov ST WORLD (US) published a virus report from Neocept.
WordUp 2.0 serial # WUP004000 to 004250 to 101124 (sic) is contaminated. Use a virus killer to remove the virus or send a blank formatted disk and a SASE to Neocept to receive Neocept's boot sector virus killer.
Neocept, Inc.
547-a Costitution Ave.
Camarillo, CA 93010
Attn: Virus Killer

2nd: I suspect that you didn't set up the program or printer correctly. WordUp prints in graphics mode to get all its fonts and pictures out. Your SG15 like many Epson "compatibles" has two modes of operation, Epson like ("Star" mode) and IBM mode. These have slightly different command sets, especially for graphics. Recheck all program settings and SG 15 dip switches. The printer must have its power cycled to recognize new dip switch settings.

This sort of thing applies to most dot matrix printers,
hope it helps,
Bob Pegram

HELP !!! PLEASE !!!

I am in need of a program that will allow me to read a picture file into PAGESTREAM. This picture is in gif format. I think what I need is a program that will convert this gif format into iff or pcx or something else that PAGESTREAM will read. My son needs this for a project at school. I need to get this for him before Thanksgiving if possible. If not possible, I still would like to get the conversion since I'm sure he'll want to do it again sooner or later. Any help is appreciated.

Thanks,

mike

3094. Dealer comments and questions

Newsgroup: comp.sys.atari.st
Date: 1989-11-20 21:43:19 UTC
From: mjv@iris.brown.edu
Message-ID: <21320@brunix.UUCP>
Source record: 246766

First let me ask my main question and then explain why.

Can any of you recommend a nice Atari dealer in the Connecticut (eastern
end prefered) or Boston area? Thank you.

Dealer Woes: Here in the teeny state of Rhode Island, we have but one
dealerof Atari wares. This place also sells Amiga and C64 stuff as all Atari
dealers seem to these days. However, these lowly people at the dealer are
also involved in pirating with the Very scummy people in charge of the
local user's group. I will not do business with a hypocritical dealer that
pirates and doesn't even let you try software w/o buying it. There is another
dealer close by in Mass. but they are very small and don't deal with Mega's. Also the owner
was very rude to me as a prospective customer and made stupid
jokes about his wife who was working the counter. I have very little
intention of doing business with either of these places.

There was a very nice store up in Quincy, Mass run by a
friend-of-a-friend
but he went out of business (he was broken into once and insurance costs
went throught the roof.)

In recent trips to California (SF Bay Area) and Oregon, I noticed that
several Atari stores the used to be are either gone or all Amiga and
Nintendo.
The condition of Atari dealers really seems sad these days. I would like
to
possibly get another Atari computer whenever it (TT) comes out, however I
may have decide to go with the Mac since I know I can easily find dealers
and info for it. The situation has been very bad out here and with the
local user's group been turned into a pay'n''pirate party bunch, I was out of
touch with Atari happenings. thanks for listening.

>Ed Hanway
>jeh@elmgate.UUCP

I think Vance from BMS said he has a 296N working perfectly fine
with the BMS controller. When i originally bought the 296N from
my dealer, we tried both ICD and Supra... neither worked.. we somewhat
concluded that it probably was in the ROM. Then we contacted Seagate,
and they told us they had problems getting it to run 1:1 on a 386 box.
But it was really hard to get a straight answer.
A week or so later, my dealer talked with Seagate again and was told
there was a bug in the ROM 8 and that unfortunately the only solution
was to do a revision. Hence ROM 12 ?

Obviously, the 296N CAN work 1:1 with the right controller.

Learn something new everyday!

Opinions expressed are the responsibility of the author.

In article <24111@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>In the "Real World (tm)", there are things known as Warranties of
>Merchantability and Fittness for Purpose. There are also things known
>as Truth in Advertising, and Fraud.

So what? Atari's products are certainly "Merchantable" and "Fit for Purpose". Their computers are salable, they sell, and they work. I don't know why you even mentioned those terms, except perhaps in a grandstanding attempt to impress. Please, spare us.

As for "Truth in Advertising" and "Fraud", if you can demonstrate that Atari has *ever* advertised a blitter chip as being available for the 512 or 1040, then you'd have a case. All you can point to are rumors and endlessly-repeated and misquoted off-hand remarks. And you are getting dangerously close to libel by implying Atari is guilty of fraud. Innuendo works both ways.

>Both Commodore Business Machines and Atari Corp. have been forced by
>law to produce products they had promised, but which for their own
>reasons they didn't want to actually produce. The Commodore-64 CP/M
>module and the Atari XF-551 Disk Drive are two examples.

I remember this; this is a completely different situation. The items in question had been *advertised* as available. They generated so little response, that the respective companies involved decided they'd be unprofitable. When they cancelled them, they were sued by some of the few people who wanted them. A case of shooting themselves in the foot, or a lack of Market Research.

>If Greg Wageman had been one of the people who had bought an Atari ST
>based on the promises of the Chief Executive Officer of the company, I'm
>willing to wager he too would be more than a little upset when the
>implied contract was broken.

CEO's of major corporations don't generally make promises to me about anything, except perhaps as a stockholder. In any event, hearing a CEO saying "Product X is in development" is worlds away from a Press Release for a new product. The latter represents a commitment to deliver a real product, the former represents R&D. Every corporation persues some product in R&D that never gets to market (that's why it's called "research"). You only get sued over them if you *formally* announce them and don't ship, and even then only if the plaintiff can prove that the announcement generated sales.

>As far as technical details, the "blitter upgrade" had been promised by
>many different Atari Corp people over a span of several years. It was not
>something that a stupid executive just happened to blurt out on a TV
>"talk show". There had been upgrades/daughter boards/motherboard swaps
>discussed by Atari for years. This created an expectation of performance
>for those who invested in Atari equipment. Atari obviously expected that
>a blitter equipped "vented case" 1040 would pass FCC certification because
>they redesigned the motherboard with a blitter socket position. "Do It
>Yourself" blitter upgrades are possible *if* you have the right motherboard.
>That leaves us with the question of why Atari didn't do it themselves...

Correction: it had been *mentioned*, not *promised*. Any "expectation
of performance" was created in your own mind. A product isn't real
until delivery date and price are quoted. Atari has done neither for
the blitter "upgrade".

They didn't do it because they couldn't make them FCC compliant. That
doesn't mean that they couldn't sell them elsewhere, where RF
emissions standards aren't as strict, just like the RF modulators
which are not available in the US, but have a space on the
motherboard. Atari, as we are now all painfully aware, has numerous
markets outside the US. Assuming that Atari's technical decisions are
driven by the US market is your mistake, not theirs.

>I'm left wondering how the STE with its "vented case" design can add
>video enhancements and SIMM memory to 4 Megs and still pass FCC certification
>if the Blitter would have pushed it over the line.

Not having compared the internal design of the STe with a 1040, I
can't comment. No doubt based on their previous experience they knew
where all the weak spots were, and corrected the design. Since the
STe is a new product, they could design with lower RF emissions in mind
from the start, same as they did with the Mega line.

>Sorry if I've exceeded my message allowance by posting this reply, and I'm
>further sorry if anyone reading this is annoyed that it's not an Atari
>cheerleader message. I don't much care about a blitter chip and I don't
>plan to say anything more about the subject. Atari Corp lied to their
>customers, and that annoys *me*

Look, I'm an Atari customer too, but I don't consider myself as having
been lied to. You have only yourself to blame for reading way too
much into comments made about *possible* future products. This is
precisely why the folks at Atari are getting so close-mouthed about
new developments. We in the Atari user community want to know that
they're developing new products and expanding the product line, but
because of attitudes like yours, where a "We're looking into..."
becomes a commitment, we must now wait until products are shipping
before we get word of them; so now people become discouraged because
"Atari isn't doing anything new".

Give them a break!

>this? (I DON'T WANT TO REFORMAT THE WHOLE DRIVE!!)

I don't want to sound uncaring about you problem, but it looks like
you have encoutered the nasty "40" folder limit that TOS incorporates.
This will mess up you drives extremely well. You can try to backup your
good partitions to floppy disk, but there is not much you can do about
the corrupted files. I encountered this twice. Even my backups were
messed up, and when I restored the files to the freashly formated
drive, I re-created my problems.

My suggestion is to backup as much as you can onto floppy disks, and then
reformt the drive. Then make sure to get the FOLDRxxx.PRG program from
a BBS or other source. Atari wrote it and it is available for no-charge.
Replace the "xxx" with a number between 100 and 999. I use a value of 150.

Hope this helps.

I just ordered MINIX today. Got it through a Book Store called "BOOKSTOP"
which gives its members a 20% discount on products purchased there.

Is MINIX really that bad. You make it sound like the worst kludge you
ever saw. I wanted MINIX for multiuser, multitasking? Does it really
destroy the hard drive? Is it compatible with the TOS file partitioning,
or am I stuck to MINIX only when I install it on my hard drive. I was
hoping to be able to use MINIX from one boot up and TOS from another
boot up. Of course not running both OP/SYS simultaneously.

From being a UNIX administrator, I am use to re-compiling the kernel.
Is it really as tough as you say it is?

The second reason that I am purchasing MINIX is to learn how to write
operating systems. People have told me that MINIX is well supported.

Thanks for the previous comments and any comments that you wish to append
to this message.

| * There were a number of TT systems, running simple demos mostly.
| (It reminded me of those early days of the 520 before there were
| any real programs).

I find this really amazing. I've seen this statement in three places now, and I guess it means that Atari succeeded in making the TT ST compatible. So compatible, in fact, that nobody could tell a TT when they saw one! There was _one_ TT running demos at the show, and _four_ running application software: Atari's DeskSet II, and 3 third party programs: DynaCadd, Cyber series software from Antic (including a beta version of their new Cyber Motion - a really neat program), and LDW Power.

People used to the feel of the above programs on ST were amazed at the TT performance. The author of Cyber Motion was really excited about it, because he was afraid that his beta version with its rough edges would look too slow at the show. He was real happy with the TT.

I guess the point was to show that the TT is a big win with the existing ST software base. I guess it's unfortunate that people came away with the impression that the only TT's at COMDEX were showing demos, and didn't notice the compatibility.

in article <1741@calvin.cs.mcgill.ca>, depeche@quiche.cs.mcgill.ca (Sam Alan EZUST) says:

> In general, computer specific hardware addons will be a thing of the past.
> I mean, shit - if we have a DMA port which can transfer data at 10
> megabits per second on our old clunking 1040sts, guess how obsolete a
> card slot which works with IBMs will be (I wish I had some numbers, but
> I bet that those card slots in the IBMs aren't much faster if they are at
> all).

The PC-AT bus at 8MHz has a maximum bandwidth of 4 megabytes/second. Of course, since it doesn't permit true DMA bus masters (it has a DMA chip for faster-than CPU transfers, in theory, but in practice the DMA chip is slower than the CPU for such transfers), the effective maximum rate on the bus is 2 mb/sec. For an 8 bit card on that bus, you're down to 1 mb/sec, and if it's run at PC-XT speeds, that's down to less that 512 kb/sec.

The Amiga bus runs at 7.16MHz, for a corresponding bandwidth of roughly 3.75 mb/sec, which can be a bus-mastered transfer (most hard disks work this way). That's not fast enough, but it's decent for many things.

For an asynchrous SCSI disk transfer, you probably wouldn't notice much difference in raw transfer speeds between the DMAed Amiga, CPU copied IBM, or DMA chip driven ST; the SCSI's upper limit is 1.5 mb/sec in all cases. However, the Amiga would spend less time in the actual transfer, so there'd be more CPU time available for other things. So, in general, faster bus access buys you bandwidth. Even if you can't think of anything that actually needs that bandwith, you'll get CPU cycles out of it.

> The only things we would need slots for nowadays is for accelerators,
> graphics enhanceors, and perhaps emulators.

They always say you won't need more slots this time, because in general, every time a real new computer comes out, all the stuff you put in the slots of the previous generation are now on the motherboard. So in the 70's you wasted a slot for a floppy controller, in the early 80s you wasted a slot for a hard disk controller, and now both of those are built in. But still, someone's going to find a use for as many slots are you give them. Just ask Apple -- they were the last ones to think they'd taken care of everything, first in the Mac and then the Mac Plus.

What goes in those slots is about 1/2 constant, 1/2 changing. The constant 1/2 is the thing that'll never be popular enough for standard equipment on your machine, such as a special purpose data aquisition board, 8 extra serial ports, superhires graphics board, etc. These things have always been around, always will be. The second 1/2 is

the "move against obselence" stuff. Open slots let you add those
floppy controllers in the 70's and hard disks in the 80s without
throwing out the whole machine. This kind of thing will probably be
less and less common, because the average person's need for any level
of computer power won't forever be growing unbounded. Human nature
will set an upper limit on how much you need here. We're not there
yet, so this kind of slot still makes sense.

I've got every slot in my Amiga 2000 here filled with something. I
just had to throw out 2 megs of RAM out of the machine to fit the
ethernet card.

David Meile says a lot of uninformed stuff about Atari history...

I'm sorry if you haven't been able to keep up with the Atari world in the last few years.. I know that it's hard to stay informed if your only source of information is the "major" Atari magazines.

If you were involved with any of the online services where Neil Harris held court, or followed Atari Corp happenings in the media, you'd have been able to follow this discussion intelligently.

Neil Harris was the "Director of Marketing Information" (or some such nonsense) for years. As such, he was the "official mouthpiece" of Atari Corp.. He promised the blitter upgrade, many times.. officially.

Sam Tramiel is the Chief Executive Officer of Atari Corp. He promised the blitter upgrade on television, in answer to a caller's question. (Sorry if you missed that.. it was prominently publicized on the national information services).

If you're satisfied with the performance of Atari Corp,. then that's just fine... for you.

I'd still like to see what would happen if the proper Federal agencies became involved in this scam...

RJK (not otherwise identified) says:

What do YOU own. I'll bet it's 1) more expensive or 2) less powerfull
or 3) another "toy" computer.

Sorry.. .my computer of choice, out of the 14 or so that I own, is my
Atari 520ST...

It's (painfully) upgraded to 1 Meg of RAM, and running 20 Megs of hard
disk. It's far more useful to me than any of the other brands of
computers I own. What we have to do is distinguish between the computer
itself and the company that produces it.

Atari Corp doesn't seem to be able to realize what a powerful computer they
have in the ST. Instead, they run off in all directions, trying to sell
toy IBM compatible (somewhat compatible) "computers", and promoting
unavailable handheld "video games" ... do either of these activities
benefit _you_..?

I'm glad you decided to make your opinions known. Maybe if more Atari
owners would make their feelings known, Atari Corp would deal more
honestly with _all_ of us...

Well, by this definition, I would suppose that every micro-programmed CPU
is considered RISC, as microcode only has a limitied amount of instructions.
What makes a CPU a RISCy one, in my mind, is one where the _user_ has few
instructions, and instead of micro-coded, it's hardwired.

If you're using TOS 1.2 or TOS 1.0, replace XXX with a number bigger
than the number of folders you have in all partitions in your drives,
plus the number of drives, plus a few for good measure. I use 250 or
so. It is *critical* to get XXX that large with this version of the
ROMS, or you can trigger the problem.

disclaimer: that's what they tell me, I'm just a dumb hydro-jock.

3115. 6502 - the ultimate (?) emulation

Newsgroup: comp.sys.atari.st
Date: 1989-11-21 10:10:51 UTC
From: hoenig@incas.UUCP
Message-ID: <3189@incas.UUCP>
Source record: 246787

Is there any use of a VIC20-Emulation on the ATARI ST ?

I wrote one to test a new kind of emulation: The 6502-code of the VIC20-Machine is not interpreted the usual way. It gets *translated* in 68000-Code at run-time. That means: If a statement is reached for the second time, it is already translated. This gets very difficult, especially if self-modifying code is alowed (already the Commodore-Basic uses it).

My final results:

- It needs a *lot* of memory:
The memory of the Atari is sliced in 8-byte slots of code for every VIC20-Byte (unfortunatly, that's not enough for a lot of 6502-Commands). An additional flag-byte is needed for every VIC20-RAM-byte.

- It's *not* faster than a normal interpreter:
Programs usually run about 4 to 5 times longer on the Atari.
This sounds very bad, but it is not. A lot of time is needed for updating the display (about 40% of the time is needed when simulating the colors on the Monochrom-Monitor) and for interrupts. Since I didn't change a single bit in the kernel, the original routine for decoding the key-matrix is running. On the other side, I had to encode the key-events of the Atari to let that routine work correct.

I found out very early, that this is *not* the ultimate emulation. But I continued working on it, until my favorite ROM-Modules of the VIC20, the games 'AVENGERS' and 'STAR BATTLE', where running. As they were made in the early days of the VIC20, their 'CPU'-usage is not too high and they can be emulated nearly in real-time. Fortunatly they use the timers to 'sleep' and not some strange loops.

Now I've got a problem: The Copyrights.
I wrote my program just for fun (although I though it's a great invention). Of course, I would allow to copy it freely. But you can't do anything without the copy of the VIC20-ROMS and some game-modules (you can get them nearly as gifts, if you still find them in a store).

The question is:
- Am I allowed to distribute these files with my program ?
- If not: Am I allowed to copy these files at least to owners of a VIC20, as they also could have transferred them to the Atari on their own ?

Is there a 'yes'-answer anywhere ?

3119. ZOO and odd addresses

Newsgroup: comp.sys.atari.st
Date: 1989-11-21 11:48:30 UTC
From: ivan@rzsin.sin.ch
Message-ID: <352*ivan@rzsin.sin.ch>
Source record: 246791

I recently had problems when I first tried to use ZOO -- it bombed
with an address trap. It wasn't until it worked OK on another machine that
I realised that my early version of Volker Brandt's EDISK was doing the
dying due to a (known) bug in the routine to transfer to/from an odd-aligned
buffer. I've just recieived the latest copy (EDISK V2.2) so that should
fix it, but I'd like to make a plea to the people responsible for ZOO to
please try to make sure it only uses evenly-aligned buffers for disk I/O.
As Volker says "Maybe *that's* why ZOO is so slow!" (try it yourself sometime
and see what the difference in speed is).

PS: If anyone has a VAX/VMS version of ZOO they could send me, my
BITNET address is IVAN@CAGEIR5A. Thanx!

First of all: I don't use Lattice C so I could be completely wrong.
Character 255 is quite often used as an EOF character, could this be a
possible source of problems?

I finally (2 days ago) obtained a copy of the PD version (JIL-2D) of JIL CAD. Anyone who wants a copy can obtain it from the Current Notes PD library. Hopefully, I will have some time to test it this week and post a mini-review on the net.

I tried the code about a year ago and my recollection is that it was top notch stuff. However, memories are dimmed with time. I am told that their is now a PC version for the 3D version that has been on STs for some time. The 3D package is supposed to be about $1000 CDN.

3123. What are these jumpers for ? (MegaFile30)

Hi,

I recently opened my hard drive and found some jumpers labelled J4 near
the firmware prom. Anyone out there knowing what these jumpers do ?
The drive is a MegaFile30.

Thanx in advance ...

#if 0
This illustrates how to emulate the white button (warmstart) or
power-switch on an Atari. It *should* be compatible with the new roms.
Normally, you would add the guts to an existing program.

> -- > Hartmut Semken, Lupsteiner Weg 67, 1000 Berlin 37 hase@netmbx.UUCP

Very interesting! Other than resetting the seek rate and using your
formatter are there any bugs that prevent general use? I.e., can all
WD1772s take the doubled frequency? Does Spectre GCR work? Can you
still set the seek rate low enough (12 msec for 6 actual) to
accomodate 5.25" 360K (IBM) floppies? Do normal formatters work for
lower densities? Or would we have to switch the 1772 clock (or the chip 8^))
all the time to do all that?

>David Meile says a lot of uninformed stuff about Atari history...

Well, actually, none of it was "uninformed". You might think I don't have the "whole story", but your use of the term is deragatory in this particular case. And the last name is Paschall-Zimbel, although the account name is still the one before my recent marriage.

>If you were involved with any of the online services where Neil Harris
>held court, or followed Atari Corp happenings in the media, you'd have been
>able to follow this discussion intelligently.

Yes, I was around on GEnie back in the good old days of 1986. No, I don't remember reading anything which was labelled "OFFICAL PROMISE" from Neil Harris. I sure hope you kept copies of each and every posting -- and if you really want to be believed on this point, POST THE COPIES. Same goes for "Official Promises" made by any of the Tramiels in response to phone-in questions -- if it isn't written up in a press release, with specs and ordering information, it isn't "official" ... off-the-cuff remarks notwithstanding.

>I'd still like to see what would happen if the proper Federal agencies
>became involved in this scam...

If you believe that there were criminal actions worth looking into, quit posting this drivel, take your evidence directly to the Attorney General of the State of California and sit back fat and happy. Otherwise, I'd suggest you drop the term "scam".

3129. Need help with OPUS Chart feature

Newsgroup: comp.sys.atari.st
Date: 1989-11-21 18:16:41 UTC
From: solenod@dragon.UUCP
Message-ID: <46f9163c.13334@dragon.UUCP>
Source record: 246701

Net-beings:

Since I have not received any replies to my earlier USA-only
posting, I am again posting this item, this time with a world
distribution.

I am unable to use the Chart features of OPUS 2.2. I would like
to ask for any help or suggestions you might care to send my way.

I followed the instructions given in the installation document,
but did not have any success.

This my setup:

1040 Atari ST, 1 meg, 1 DSDD drive.
TOS: 1.2? (copyrighted 1985).
GDOS Version: 1.1

Disk A:
GDOS.SYS - Directory
ASSIGN.SYS
AUTO - Directory

AUTO directory contains:

GDOS.PRG

GDOS.SYS directory contains:

ATSS10.FNT
ATSS10CG.FNT
ATSS10EP.FNT
ATSS10MF.FNT
ATSS10SP.FNT
LQ800.SYS
META.SYS

ASSIGN.SYS contents:

```
PATH = A:\GDOS.SYS\
; Change A: to drive w/GEMSYS folder
00p screen.sys
; --START OF SCREEN FONTS--
01p screen.sys
02p screen.sys
;-----------------
03p screen.sys ; Med-Rez screen workstation
; SWISS
```

```
ATSS10CG.FNT
;-----------------
04p screen.sys ; High-Rez screen workstation
; SWISS
ATSS10.FNT
; -- START OF PRINTER FONTS --
21 LQ800.SYS
; SWISS
ATSS10SP.FNT
;------------------
31 META.SYS
ATSS10MF.FNT

DISK B:
ASSIGNER.PRG
ATSS10.FNT
ATSS10CG.FNT
DESKJET.INF
EPSON.INF
FONTWID.PRG
INSTALL.DOC
OPUS.CNF
OPUS.PRG
OPUS22.DOC
OPUSCOLR.RSC
OPUSHELP - Directory
OPUSMONO.RSC
OUTCHART.PRG
PRINTDEF.PRG
PRINTER.INF
PRINTDEF.RSC
SMSS10HI.FNT
SPL_LOG.OPS

The procedure that I follow is this:

a) Boot up with disk A. I get the message stating GDOS 1.1 is installed.
b) Double-click on B drive icon, insert disk B. Double click on OPUS.PRG.
c) The program starts loading and asks for disk A to be inserted. I comply.
d) The disk drive comes on and after a few seconds the following message
is displayed:

ERROR LOADING SCREEN FONTS
MAKE SURE THE GEMSYS DISK IS
IN PLACE.

I am given the options to CANCEL or RETRY.

If I choose CANCEL it places me in OPUS but the Chart Menu is
"ghosted". RETRY asks for disk B to be inserted but then places
me in OPUS with the same results.
```

What am I doing wrong? I would like to get this feature going since I've sent for OPUS 2.3 .

Please post or e-mail me your suggestions.

Thank you,

David Soleno

There are at least 296N users that have it
running 1:1.

Vance from BMS, and someone from the Amiga world.

Apparently, the problems lies not with the Seagate
but with the controller being used.

I had no success with ICD nor Supra with the 296N.

Perhaps ICD and Supra have fixed the problem at this point.

Lessee if I can get in before kbad does. }-) You shouldn't assume that
the ROM lives at 0xFC0000, 'cause it can move around on you.
A better way would have been to declare a pointer to the reset function,
and set that the 0x42a, the resvector system variable. Then jump
thru the pointer.

A question - why doesn't anyone just use the 68000 RESET instruction?

>This is a very good idea, and a very creditable approach to marketing.. but..
>did any of those envelopes you saw with the Portfolio info in them mention
>*anything* about the other Atari computers...?
I'd bet not - actually, I'd hope not. From a realistic standpoint,
Atari will have a hard enough time getting _one_ concept past the "Oh,
Atari, they make video games" reaction most executives will have. Getting
two past would not only be extraordinarily unlikely, but the attempt
itself would be unwise. Get ONE point in, and make it. Then when they
show up in the store to look at the Portfolio first hand, have the other
computers clearly marked and available as well.

TO ATARI:
You guys might want to change your magazine Portfolio ads just a bit.
The screen is already small; the spreadsheet you've got running (in the
pictures I've seen, anyway) make it look much smaller. That border and
the unnecessary info reduce the percieved workspace down to three lines
by four numbers - not the impression I'd want to make...

FYI, the UN has not standardized to English as THE working language.
Perhaps access to USENET should be restricted to people that know
at least two languages :-)

>At the very least, if you are going to
>post in a language other than English, restrict the distribution to

The USENET software is currently too limited for that. You can't say
'everywhere except the USA'. Given the popularity of the ST in
Germany it might be best to change the working language of this
group to German (half :-)). Actually, posting in German to the US is
a waste of resources in this respect, so I grudgingly admit you have
a point there.

> I have version 3.0.5

What's going on here is simple ;-) Chicago is 6 hours west of
Greenwich. I bet it said the time was six hours early?? Try this:
set your hardware clock to Greenwich Mean Time (a good source would be
WWV on 5, 10, or 15 MHz, or CHU @ 7.335 and 14.670 MHz) and set the
TIMEZONE variable correctly. MWC is attempting to emulate the Un*x
way of setting clocks, in that all timestamps are carried internally
in GMT, and adjusted _for display purposes only_ by the TZ variable.

Although far from Connecticut, there is an excellent store in Kansas
City that I would like to recommend to everyone not having a store
in your area. It is The Computer Room, run by Larry Kopenhaver (spelling??).
Phone number is 816-363-2814. Although not a large store, he sells ONLY
ATARI; he knows his stuff, and is VERY helpful (for example, he even
downloaded some crucial program to me from his home). This type
of dealer needs the support of us all.

I have no affiliation whatsoever with the store (other than the $$ I leave
with him!)

I've posted such a program to comp.binaries.atari.st some months ago.
I'll mail it to anyone on request. It's nothing spectacular, but it does
the job. I'm working on a version that generates 'twisted' sectors, but
that takes a lot of time I don't have currently.

>or am I stuck to MINIX only when I install it on my hard drive. I was
>hoping to be able to use MINIX from one boot up and TOS from another
>boot up. Of course not running both OP/SYS simultaneously.

I'm sorry if I sounded too emphatic over the installation problem of
MINIX/ST. The reason I had problems installing it was mainly due to my
Supra adapter on my hard drive. There have been other reported
problems of this from other Atari ST Minix users also, so remember, I'm
not the only one with a small grudge against Minix. But of course, the
majority of those who buy Minix usually get it to work - now if I can
only get my hands on an ICD adapter. :-)
Well, not getting the installation didn't exactly "destroy" my hard
drive - it made the partition to which I tried to install Minix
unworkable and I couldn't reformat or zero out the partition in order
to make it be used for regular TOS/GEM - therefore,
in order to make it working again I had to reformat the entire drive
(strange huh?). (BTW, any Minix/ST users out there able to get Minix
working with Supra adapters?) I believe if you use the proper
adapter (ICD, Berkeley Microsystems, Atari's) it should work,
if I remember correctly from a 'compatibility' text file that
A. Tanenbaum sent me but have since forgotten where I've put it. :-(
Once you install Minix on a partition, I believe you can only access it
from running Minix only. Minix, like Unix has it's own file structure
with different lengths for it's filenames and what not so TOS can't
access it directly. I believe there is a way to transfer files back and
forth between TOS and Minix (a utility perhaps included in your
Minix disks?). Oh yes, I learned recently that Minix 1.1 for the ST
isn't multiuser - at least not until you get the extra rs-232 drivers of
some sort...the IBM version is though. :-(

>>From being a UNIX administrator, I am use to re-compiling the kernel.
>Is it really as tough as you say it is?

Well, I'm not much of a Unix administrator, so that's two viewpoints on
the same thing. From what I see, it seems Minix is definitely geared
more towards those who have the time getting Minix to work properly and
reliably (and those who have a good Unix knowledge). But there's always
MT C-shell, and hey, OS9 too! Heh heh...

>The second reason that I am purchasing MINIX is to learn how to write
>operating systems. People have told me that MINIX is well supported.

Indeed it is well supported, especially in comp.os.minix. I did
however remember seeing a few msgs in which some users were discouraged
in porting Minix/ST over to other 68k-based systems because of Minix' use
of the 'null' value/pointers/etc, and then they started arguing over
the commercial value, and therefore the educational value of Minix, etc.
Sorta like what's happening on comp.sys.atari.st with all this bashing eh?
:-)
Overall, I would say Minix is good - I've used it on a friend's Mega 2
with ICD hd and it really worked. I guess I'm one of the few frustrated
users just trying to get the darn thing to install on my hd!
(believe me, I've tried...and I had help from my friends also...no luck)

>Thanks for the previous comments and any comments that you wish to append
>to this message.

You're welcome. Unlike what I had to go through, I truly hope Minix works
well for you.

3141. Blitter disappointment (was: Time to create comp.sys.atari.flames)

Newsgroup: comp.sys.atari.st
Date: 1989-11-21 20:29:08 UTC
From: rwa@cs.AthabascaU.CA
Message-ID: <1261@atha.AthabascaU.CA>
Source record: 246713

For what it's worth: I have a blitter. It's $75 down the toilet.
The speedup it provides is _very_ marginal (< 25%), and affects
only a few operations (essentailly, large blits). QuikST and the
TOS 1.4 upgrade are much more cost effective. When I get home
tonight I'll try to post some benchmark numbers.

Also for what it's worth: the JRI Jato board is another $100 down the
toilet. (This is a soi-disant cpu-"speedup" board). I measure about
5 to 10% speedup. This is not enough to notice; it's measurable, but
not _noticeable_. I agree a benchmark can be cooked up that this
board will show much better results from, but in general use (which is
what I generally do, of course) it's a looser.

On a more upbeat note, I am encouraged by what I've seen so far of
Dave Small's '030 board proposal, and hope he can make it into a
product. Between this, the TT/p, and the TT/x, there may indeed be an
upgrade path for ST users who need more horespower and better video
after all. It sure has been a long time coming, though. 1985 -->
1990 is five years; in this business, that's about a half century.

3142. spectrum and digitizers

Newsgroup: comp.sys.atari.st
Date: 1989-11-21 20:30:00 UTC
From: gng@spocom.UUCP
Message-ID: <21@spocom.UUCP>
Source record: 246714

Thanks to Lars-Erik Osterud (larserio@ifi.uio.no),
Scott D. Yelich (scott@cs.odu.edu), and Steve Belczyk (seb3@gte.com) for
their info. on Spectrum/Quantum Paint.

I think I should reveal first why I've been asking for this info.
I may very soon get access to a Nikon LS-300 (or was it 500? ahh...) film
scanner - how it differs from something like Computereyes is that instead of
getting an image from a video camera or vcr/tv, the Nikon (and other film
scanners like it probably) gets it's image from a negative/positive 35mm
slide. And at a great resolution too - 4096x6144 as I recall! And at 24bits
(16.7 million colours), etc, etc....Now, I know Trio Engineering (Spectrum's)
has worked with Digital Vision (Computereyes) to make Computereyes save a
digitized image in Spectrum format, but I haven't heard of any other efforts
by them - especially with a film scanner.

So basically, what I want to do is to digitize an image from a 35mm slide or
negative from the Nikon and display it on an ST by making a special program
to do exactly that...just like with Computereyes.
Sounds fun and easy doesn't it? (Ha, yeah right...)

Anyhow, I think I'll opt for the Spectrum rather than the Quantum Paint
format in saving a picture from the scanner. So now that I have a grasp of
how Spectrum works, is there any sample C or assembly code out there that
for instance, demonstrates how to load a Spectrum picture in?
How about a text file describing the format of a Spectrum picture?
And I'll probably need help in knowing how to make the program downgrade
the resolution from 4096x6144 to 320x200, and the colours from over 16 million
to 512! Thanks in advance...

The reset instruction asserts system reset to all peripheral devices (such as
the mk68901); it does NOT reset the mc68000 itself.

Netlanders,

I saw the book, _The MINIX Reference Guide for the IBM PC/XT and AT_
and rememberd something on the net being talked about MINIX being
available for the ST(acey) machines. I have not read this group
since beginning college, so I am a little behind on what the scoop
is on MINIX w/ the ST. Where can I get it? How much does it cost?
What about support?

Since I don't get a chance to muddle through the groups here that
often (our vms doesn't carry the group, so i have to use rn on a
bsd machine.. trying to get something better here for full-screen
use, but politics get in the way.. :) so if you could email me your
replies, i'd appreciate it.

thanks...

Opinions expressed are the responsibility of the author.

In article <15@spocom.UUCP> gng@spocom.UUCP writes:
>
>Some more quick questions - Does anyone have information as to how spectrum
>and quantum paint programs are able to make the ST display more colours than
>usual? I'm especially bewildered as to how quantum paint can display
>3375 colours or more! Any info appreciated...

Spectrum 512 works by using the CPU to reload the hardware palette
registers during the current scan line. An initial palette is loaded
during horizontal retrace; then, in a *very* tight loop, each register
is loaded in sequence with a new color from the Spectrum palette.
Since each register is reloaded twice in the scan line, a total of 48
different colors are possible in one line. In addition, since there
is an independent palette for each scan line, all 512 colors may
appear within one screen.

I don't know how Quantum Paint works, but I suspect they use some
variation on this scheme.

Subject: Blitz Archive file
To: Info-Atari16@Score.Stanford.edu (

My INFO-ATARI subscription has lapsed into never-never land with the move of CANADA01 last week and I haven't read any replies directly to the net. I have attempted to mail directly to the people who mailed me with a request but our mailer can't crack the following:

oplinger@ra.crd.ge.com (B. S. Oplinger)

If you have a gateway please let me know.

PS when you duplicate using BLITZ you should watch it VERY carefully to ensure the tracks are not skipped and duplication doesn't pause. I think the several reports of problems duplicating are due to loss of synchronization, not inability to copy.

PPS a backup of KULT disk 1 worked fine for a while, then stopped. I think the bit timing might have been too tight and the quality of the media I duplicated to permitted a bit to 'migrate' (FCI too high for the media?). Anyway, I backed up again and it's ok now.

>crashes, and so on. I believe that the drive can't write to certain
>sectors (I recently noticed a <write fail> message from the ICD utilities).
>What should I do?

Step 1: Back up as much of your data as you can WHILE YOU STILL CAN.

Step 2: Relax in the pleasant knowledge that your data is safe.

After steps 1 and 2, I would ZERO the partition. This feature is avail-
able in the ICD utilities. Zeroing the partition will erase the direc-
tory and may solve your problem. What caused the problem in the first
place, is anybody's guess at this point. Maybe it is the 40 folder
limit, but it could be hardware too.

Good Luck!

domen@wiener.crin.fr (Eric Domenjoud) asks:
| 1/ How do I put the mouse at a specified location on the screen ?
You need to intercept the mouse cursor change vector, which is an
interrupt routine, and feed the coordinates you want to the AES.
Check the vex_motv() function documentation in whatever books you're using.

| 2/ How do I bound the mouse to a box xmin-xmax,ymin-ymax ?
With your own mouse interrupt handler installed, you can effectively limit
the motion to whatever you want by discarding any mouse movement that causes
the cursor to go outside of your bounding box.

| 3/ What does the GEM function CELLARAY and how do I use it ?
The cellarray VDI function is not supported in TOS.

From: kbad@atari.UUCP
Message-ID: <1816@atari.UUCP>
Source record: 246723

A patch program should be available for the DESKTOP.INF bug you mentioned.
It was unfortunate that some ROMs went into machines before we found that
particular bug. A new STE ROM release has been made which fixes the problem.
Only a few European versions of TOS were affected.

Contact the customer support people at the Atari subsidiary in your country,
and ask for STE_FIX.PRG. If you are unable to get the STE_FIX.PRG, please
please drop me a note and I'll try to post it to the net.

Other than that, the two bugs we knew about in Rainbow TOS - the
internal AES and Rsconf() bugs - are fixed in STE TOS. The screen
behaviour you describe sounds very strange. It could be a hardware
problem (a bad BLiTTER? I don't know - I'm not a hardware guy).

I apologise sincerely for any trouble the DESKTOP.INF save bug has caused
any STE owners, and hope you can get the replacement ROMs soon.

Well, after having no problems with US version 3.01, I received an error message today about 'This is the US version. You must have a US machine.'.

This occurred when I placed pc-ditto.prg in the AUTO folder and tried to have it execute upon boot-up. So out it went, along with the error message.

I did use DC Formatter, that was what allowed me to read the floppy on
the ST. It will not write however (except occaisionally it will write
the directory sector). It is a QUME drive with only jumpers for the
drive select.

There isn't any way to format a single partition. However, the
new ICD utilities will allow you to check for bad sectors in a single
partition. Set the retries high, so that it checks them several times.
This will definitely catch any bad sectors, and should write them into
a table. The hard drive won't try to access the sectors in the bad-
sector list.
The last response sounds very likely though. I set my ICD utils
for 200 extra folders, since I've got *lots* of them. Watch out especially
when you do BACKUPS of your hard drive. You can end up with garbage backups
that have some folders, but other folders are gone (couldn't be opened
successfully, I guess). When your drive goes, the hidden flaws in your
backups will become *very* obvious. I know from experience.
The moral: Allocate some variable space in your brain to store
the current number of open folders (a rough estimate will do). When you
approach the limit, reboot. You may have to save a partition at a time
even with over 100 folder limit. I still do with 200, to be safe.

3158. Macintosh Emulation using Atari

Newsgroup: comp.sys.atari.st
Date: 1989-11-22 05:42:01 UTC
From: caseyng@cie.uoregon.edu
Message-ID: <1989Nov22.054201.8946@cs.uoregon.edu>
Source record: 246730

Hi,
I am thinking of getting a Macintosh. However, I do know that
Mac SE is a terribly slow machine (over-priced too). Could
anyone reading this give me some info on using Atari ST for Mac
applications?

I would want to use the ST as a Mac, using programs like Word,
Excel and probably some printing. A harddisk would be necessary.
How can I do it with Atari, and are there any advantage/disadvantage
on doing this? Also, I would like to be able to use all my
Mac formatted 3.5" disks too.

Since I have yet to own an Atari, your e-mail response will be
appreciated. Thank you.

Are there any magazines featuring the Atari ST (exclusively or
partly) that can be recommended for an ST beginner who wants to
learn to make better use of his machine.

Maybe some of them even with special student subscription rates?

I'm posting for a friend; I know next to nothing about the ST.
But please email your responses to me: pjd@hpuxa.ircc.ohio-state.edu

>write-through 32k cache.
>The way that it wins over the PAK68 is that Jim Allen has partially
>decoupled the processor speed from the video speed.

True.

The PAK68 was designed to be swapped against any 68000 proc. It's not ST specific and does not fit in the ST enviroment nicely.
A ST specific board can do pretty much more.

The main problem with the 020 cache is self modifying code.
The external, write trough cache of the 16 MHz 68000 boards works well, the 020 and 030 internal chaches won't.
As Alan said, some programs will loose on the TT; the reason is the cache.

>> The ST is a closed machine; a compatible, faster
>>redesign is pretty exspensive.
>But the TT *is* a compatible redesign with 32-bit everything, right?
>It will be interesting to compare the TT to other similar '030 boxes,
>when/if it arrives.

For me, the "if" is true.
I'll believe in this machine, if I could buy one at my dealer's.

Mr Hartman said, it would ship Sep to Okt 1989 (march, CeBIT).
This statement was corrected at the Atari fair in Duesseldorf to Nov 89.

Now it's "early 1990". Too bad. Now, Nov, is the time, everybody discovers, he has something left in the budget. He thinks about what to spend it on.

He will not spend it on a non-existing machine...

> problems with the drive itself? As far as I can tell, the ICD utilities
> won't allow one to reformat a single partition: how does one accomplish
> this? (I DON'T WANT TO REFORMAT THE WHOLE DRIVE!!)

You can Zero the directories of a single hard drive partition with
a program called HDUTIL.PRG available from the ICD customer support BBS.
Also, a program called DLII comes in handy for repairing corrupted
disks (floppy or hard drive). DLII is also available at the ICD BBS.

> b) Is there any way of determining which sectors are permanently corrupted,
> so that when I reformat the partition I can tell the drive to ignore them?

When you format the hard drive with the ICD utilities, it will tell you
which sectors are bad and will automatically skip them. The next time you format your
drive, you can tell the format program where you discovered bad sectors
the last time you formatted it. When you purchased your HD, a list of bad
sectors should have been included with it.

Never mind, this is one of those problems that if you (Not me) leave
it alone long enough it goes away. It turns out that you need to use the
-i switch of mermit (i.e. kermit -i) telling it to transmit files "as-is",
otherwise it strips off carriage returns (even in binary mode!).

I think there is interest (actually a lot) but at least I didn't
get a very precise view about what is needed as a hardware. I know
that I am not capable of doing add-on boards. I have the Mac Roms
though (if it can use 128K ROMs). But if someone can certify that
I can get a hold of the hardware needed I'm for YES.

> Alan Chan
> abc@arthur.cs.purdue.edu

That sounds a lot like the problem I was having when I first got Microsoft Write. I, too, am using an older Gemini 10X printer, but I worked around the problem this way (I know these are two different programs, but they both use GDOS so this might help).

1. First I made sure I was using the FX80.SYS driver and that the printer setup (on the DA) was set to 960 dots per line.

2. I patched the printer driver so that that the proper sized line feeds were sent to the printer. This came about after I finally got something to be printed - there were gaps in the printed material.

Now anything that uses GDOS will print properly on my printer. I don't think I can legally post the modified driver here on the net, but I can try to dig up the docs I wrote to explain how to patch the driver. If there is enough interest, I'll post them, otherwise, I'll email them.

>atari canada says that they will sell pieces of the dev kit by themselves.

Could someone at Atari U.S. comment on this? Laser C's inline assembler
is good enough for small things, but I wouldn't mind having a decent stand-
alone assembler. (And I DON'T want a pirated copy from anyone, thank-you.)
Does/Will Atari sell MADMAC separately? For, say, in the neighborhood of
$40 or so? (Where do I send the check?)

This may be a little after the fact, but I did not think of this before... Some people out there have been looking for inexpensive replacements for their Atari mouse. Well, there is another option that hasn't be mentioned recently. The Atari 2600 trackball. With just 4 wires added to the circuit, the trackball can be used as a mouse for the ST in the "TRACKBALL" position of the switch, but yet function as a joystick in the "JOYSTICK" selection. The mod. works quite well and having the joystick portion functioning yet is a real plus. The nicest fact is that the trackball can be picked up at Kay-Bee toy and hobby stores for about $10. Not bad compared to the $50 pricetag for the replacement mice in the market.

Just wanted to offer another alternative!

Rats! I looked up the possible seek rates last night, 6 msec is as slow as she goes. It would also be hard to boot from a floppy with this mod (double - 16Mhz - clock for 1772 + formatter + "6"msec seek rate). Do you have to have a seek rate setting boot sector on every boot floppy and would that idea even work?

Source record: 246744

Why do I want a TT? Why do I complain? Because my livelihood
depends on it.

I am about to take on another major scoring job- full symphony/4 movements
that needs to be delivered in January.

Unfortunately, the graphics of the ST is mighty slow when you start
shifting a full score around on the screen. This leads to mistakes
if not a heart attack due to frustration. I really want a fast 030.

Buy a MAC? no way... the ATARI software is better. So I have to
relegate myself to the ST... I have been holding off buying a Mega
for a long time.. thinking the TT was just around the corner.

I don't know why i thought that... perhaps its just a good marketing
plan on the part of ATARi... get as many megas off the shelf for
the OLD price before we introduce the TT...

If the MAC had an ATARI emulator, I'd use NOTATOR on the MAC..
Some of us own a machine for its SOFTWARE.

-kevin
Anybody interested in unloading their Mega4ST/SLM804 (or HP)
please let me know... i may need it next week.

3175. Bug fix for top (Sozobon 1.2)

Newsgroup: comp.sys.atari.st
Date: 1989-11-22 18:07:48 UTC
From: mj@myrias.com
Message-ID: <627761270.27797@myrias.com>
Source record: 246746

```
The following information
>> From uunet!isis!onecom!wldrdg!hans Wed Nov 22 01:25:24 1989
I am just a messenger. :-)
mj@myrias.COM
>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>
```

Here is a bug fix for "top" in Sozobon release 1.2. You will need it if you use the -O option at all.

Basically, several calls to the function "uses" or "sets" were incorrectly coded with register masks instead of register numbers. The fix is to take out the RM() calls in several places.

Also, line 299 of peep3.c should call "uses" instead of "sets" with the first parameter being "i2" not "i3".

In "peep2.c", make the following changes:

```
688c688
< if (uses(i2, RM(dr1)))
---
> if (uses(i2, dr1))
736c736
< if (uses(i2, RM(dr1)))
---
> if (uses(i2, dr1))
784c784
< if (uses(i2, RM(dr1)))
---
> if (uses(i2, dr1))
```

In "peep3.c", make the following changes:

```
299c299
< !sets(i3, RM(i3->src.areg))) {
---
> !uses(i2, i3->src.areg)) {
333c333
< if (sets(i3, RM(rm)))
---
> if (sets(i3, rm))
400c400
< if (sets(i3, RM(rm)))
---
> if (sets(i3, rm))
467c467
```

```
< if (sets(i3, RM(rm)))
---
> if (sets(i3, rm))
```

After you have made these changes, recompile the optimizer "top" without the
-O option (dont use the old "top"). Then install this fixed version of "top".
Now recompile again with the -O option (e.g. using the newly make "top").
Now install this "top" as your new version.

Source record: 246747

Here's a recent msg. I received from Ge' Weijers <uunet!sci.kun.nl!ge> although
I posted the summary too quickly before I recieved the msg. Thanks!

>1) What is the name of the OS and the latest version of it?

RTOS V2.2 (I've only got 2.1, but I'm getting 2.2)

>2) Is this OS multitasking, multiuser, or both?

Both, but users can annoy each other easily.

>3) What is the minimal ST hardware (and software if necessary) configuration
> for this OS and if possible, the usual/best configuration for it?

Runs smoothly in the humblest ST 520 with only a single sided floppy drive.

>4) Who is the manufacturer of this OS, and how can they be contacted?
> (address, phone, uucp, etc)

IF you speak German (no english docs as far as I know of), it is sold
by a company called eMedia in Hannover, BRD. I can get more info if you really
want to.

>5) How much does it cost (at the present time if possible)?
DM 270,- (130 $)

>6) How long have you been using this OS?
A year.

>7) On a rating of zero to ten, how Unix compatible is this OS?
> (An explanation following it would be nice too)
-1. It is TOTALLY different. it's a Real Time Operating System, with
a builtin compiler,assembler,linker,task kernel,file system etc.
The language compiled is Pearl (tasks & semaphores available, but
a syntax you could scare dogs with), but the nice thing is that it all
fits into 128K RAM. The same system can be run on a number of single
board computers, and give you a complete if clumsy development environment.

>8) What strengths prevail in this OS (if possible, compared to others also)?
The minimal environment you need to run it. Use an ST (or Amiga) as the
development environment, and then copy the linker files to your dedicated
computer. Version 2.2 also supports networking, and can read MSDOS floppies.

>9) What weaknesses are noticeable in this OS?
Very simple command language etc.
It's not a Unix look- or workalike.
The keyboard tables are German-only. Some zapping required.

>10) Other comments about this OS, the makers of it, etc?
It works, it gets the job done in little memory.
A Modula-2 compiler can be bought these days, at 3 times the cost of the OS.

3179. Re: Experience with Toshiba 3 1/2 inch double sided drives?

Newsgroup: comp.sys.atari.st
Date: 1989-11-22 20:44:49 UTC
From: chad@norge.dec.com
Message-ID: <1705@hiatus.dec.com>
Source record: 246750

I've had a Toshiba drive in my upgraded 520STfm (internal floppy) and it
works great
except that the ST doesn't detect media change correctly. Jumpering
with a switch
some lines fixed that but it ain't ths safest the way I did it.

I paid about US$ 85 including postage

maybe somebody has the dirt on the media change?

Source record: 246651

I have been reading this newsgroup from the beginning, and I know that Neil Harris did state very clearly a number of times that the blitter upgrade would be available for the 520 ST and 1040 ST. Since he worked for Atari at that time, the statements were assumed to have some credibility.

I know a number of us became skeptical some time ago about Atari's committment to the blitter. When some of us expressed our doubts on Usenet, we were told by Neil that the blitter upgrade was still planned.

No, I haven't saved all my old email and news messages -- I am just recalling events as I remember them. I anticipate flamage, so I will be waiting by my mailbox with a bucket of cold water.

3181. Re: Floppy Problems After 4 MB Memory Upgrade on OLD 1040ST

Newsgroup: comp.sys.atari.st
Date: 1989-11-22 22:32:03 UTC
From: dclemans@mentor.com
Message-ID: <1989Nov22.223203.17664@mentor.com>
Source record: 246652

I would rather doubt a MMU chip problem. It is MUCH more likely
that you are seeing ringing and other noise problems. A good way
to check for this is to run a decent memory tester program when
the board is set up for 4MB, and see where it gets errors, and what
the patterns of error bits are. If you get randomness, it is almost
definitely ringing or other noise problems on the dram control lines.

One example to show this... Recently I upgraded a Rev. E 520 ST
board to 4 megabytes using the "New World" board. Initially it showed
exactly the same symptoms you got; it worked fine at 2.5megabytes,
but got memory errors at 4megabytes. I eventually got it to work
at 4 megabytes by shortening 3 of the interconnecting cables to
about the minimum workable length (about 9 inches -> 6 inches),
added inline 68 ohm resistors to the RAS/CAS lines for the upper
bank, and an inline 33 ohm resistor to the MAD9 line from the MMU.

3182. Re: Hard copy on a 24 dots printer

Newsgroup: comp.sys.atari.st
Date: 1989-11-22 23:39:41 UTC
From: jpexg@wheaties.ai.mit.edu
Message-ID: <5121@rice-chex.ai.mit.edu>
Source record: 246653

I wrote a printout program for my Panasonic KXP1124 (no guarantee of compatibility with other printers). It accepts either DEGAS or TINY format files of black and white screens only, and it doesn't replace the alt-help command because I couldn't figure out how to do that. Instead I use Braner's BARREL to grab screens and store them as DEGAS files, which is crude and wastes storage space. If I want to keep stuff long term I translate it to TINY.

The printout is either 1, 2 or 3 dots per screen pixel; the last prints sideways on the paper and almost exactly fills a sheet, while at 1 dot per pixel the printout is less than 4 inches across.

I don't know if this has been noticed and reported before but...

GFA Basic 2.0 interpreter no longer will abort running on pressing the
three button escape sequence. I believe this is because tos 1.4 now
looks for these keys to do different warm/cold boots.

GFA Basic 3.0 does not seem to have this problem.

If you don't care about 68000 architecture skip this ....
This is an excerpt from some mail I got about my offhand comment
to the effect that the 68000 was a RISC chip at heart. I found it to be
interesting and thought that an addition to this notestring involving something
other than Atari-bashing wouldn't hurt. So I decided to post it. I think
the author sent it E-mail to avoid embarrassing me, but I didn't include his
name in case he's bashful or something. Maybe he will take credit for it if
he see's it, in case somebody wants to know something more about this subject.
I also felt compelled to post it because I was wrong about the 68000
being RISC, and I would hate to think I had left somebody confused because
of my lack of 68000 experience. I know it's very frustrating for me when
people give information involving things they know little about. I hope this
fixes it. I guess the moral is to use information you read or learn yourself,
not what your hear from co-workers or friends. This guy has some
experience, so I think it's likely to be valid. My thanks to the author for
responding with intellect and good manners to my mistake.
Note that I still don't claim any 68000 experience and I didn't write
this. For that reason, any flames sent will most likely be re-routed to
/dev/null without much parsing.

Note: Timo said (correctly) that the 68000 is much more CISC that RISC.

********** Here's the 68000 info **********
I happen to be an undergraduate in Computer Science with a strong background
in Electrical Engineering. From my independent research into the subject and
class work on the subject, I have to agree more with Timo.

The RISC archetecture inside of a 68000 that you speak of is the microcode
processor. While it is a very simplistic language to work in, you definately
do not want to program in it. It deals with basic dataflow within the
processor between registers, ALU and memory access ports. On the 68000 and
the 8086, the microcode in tucked away within the chip and is not accessible.
However, this is not always the case, the VAX processor is most definately a
CISC processor, but the first thing it does when it boots is load the
micro-code into its internal memory.

But even micro-code can be hairy. Often, the simplest and most effective
method to create a microcode is to use one bit per register and other parts
of the logic. The whole string of bits could conceivably be longer than the
instructions of the processor itself. In fact, a micro-code which is larger
than the "machine code" is not infrequent in the world of processor design.

But this is all beside the point. The designations of RISC and CISC refer to
its outward construction. The microcode does not enter into the picture
making this determination. In fact some argue that micro-coded processors
are not really RISC. Never-the-less, an example of a RISC design would be

the transputer processors from Inmos. While they are micro-coded, they have a very reduced instruction set. Every instruction fits into a single byte! The processor has only 3 (or some small number of) registers. In comparison, the 68000 encodes all command within a single word (32 bits). There are considerably more instructions which may be encoded in 32 bits for 16 registers total. From this, we conclude that the 68000 is not a RISC processor. The 8086 is even worse. Based on an old 8bit processor, the 8086 remains totally compatible with the older design. The design of the instruction set for the 8086 is, as a result, a big mess.

Message-ID: <1989Nov23.031757.9434@aucs.uucp>
Source record: 246659

My 1040st buzzes. It's not the monitor, it definitly comes from the machine itself. It's a real highpitched whiney buzz that seems to come from somewhere on the left side. What's more, the pitch of the buzz varies with whatever is going on on the screen, e.g. a higher pitch with a white background and lower pitch with a black background.

Has anyone else ever heard of this, or is this completely normal and am I making a noodle out of myself? I know someone with a 520st and it is completely quiet.

It's getting quite irritating. Please email me any information that any of you might have. Thanks.

3188. Experience with Toshiba 3 1/2 inch double sided drives?

Newsgroup: comp.sys.atari.st
Date: 1989-11-23 04:34:23 UTC
From: timcc@csv.viccol.edu.au
Message-ID: <3156@csv.viccol.edu.au>
Source record: 246660

Before I go out and buy one,

Has anyone out there got any first-hand horror stories on Toshiba 3 1/2 " double sided drive mechanisms? I am told they are "very reliable", but then it was the person who would be selling me one who said that.

This would be a mechanism suitable for replacing an SF354 mechanism (single sided).

I was offered a 6 month warranty if I installed the mechanism (into my own modified SF354 case) myself, or a 12 month warranty if it was installed by the dealer. Are these values reasonable? I'm looking at A$200 for DIY, A$250 for dealer installed and 12 month warranty, or A$220 for DIY and 12 month warranty (presumably after the dealer has ratified the installation).

The Australian dollar currently buys about 77 US cents.

Any info appreciated.

> Hmmm,. I wonder why is the Atari blitter so ineffective. Its
> speed is no where comparable to the Amiga's blitter. Why is the
> difference?

I know of two differences. The primary one is that the Atari blitter shares the main system bus with the 68000 in the ST. So you have to alternate between blitter access and CPU access. The Amiga blitter, on the other hand, is on a separate bus, and when the video load isn't outrageous, or the CPU has work to do outside of video memory, the CPU and blitter can operate in parallel. And since the Amiga blitter only takes two clocks for a memory cycle, it can run twice the speed of the 68000 if it uses both halves of the cycle (thus kicking out the 68000, but of course, the Atari always has to do that).

The other obvious difference is that the Atari blitter handles only two sources into one destination, with 16 possible operations, while the Amiga blitter handler three sources into one destination, with 256 possible operations. There are some clever additions to plain bit blitting. The Atari blitter apparently has a little internal chunk of memory which is used to support pattern fills without having to constantly fetch the pattern from main memory. The Amiga blitter has hardware line drawing.

Dave,

I've checked my source code, and that alert will appear only if the GEM vst_load_fonts() call returns a value of zero, indicating no fonts were loaded (this way users with only a SS drive could use Opus, since the program, resource, etc. _plus_ fonts couldn't fit on a SS disk). I guess it's possible you are running out of RAM, but with only screen font specified in ASSIGN.SYS... seems unlikely. But try booting without any RAMdisks, large accs, etc. and see what happens. Your ASSIGN file looks OK; does it work with other GDOS programs? I really don't know if this will make a difference to GDOS, but you might also try removing the last backslash in the PATH = line; it's not required. But if the ASSIGN file works with other GDOS using programs, then it would be OK.

Replying to Ken Badertscher's comments...

Ken, one thing I think should be made clear.. I have the utmost respect for you, and Alan, and all the others who are trying to improve the state of the Atari line of computers. You've all been doing a fine job at your end of things. Unfortunately the R&D department doesn't run Atari Corp.

I have absolutely no respect whatsoever for Neil Harris and (my opinion) the Atari world is far better off that he's out of it.

It's true that there was never an official product announcement concerning the blitter upgrade. But.. Neil Harris and others from Atari went FAR beyond "mentioning that it was being worked on". There were technical details of the upgrades given, timeframes for delivery of the upgrade and even prices. I believe it was the "daughterboard" version of the upgrade including the blitter and the 6 ROM set of TOS 1.2 that had a price of $120 given. Later, when it was decided to do motherboard swaps instead of a hardware add-on, another price (which I can't recall exactly now) was given, for the motherboard swap through Atari dealers. Again, this is going far beyond "mentioning that it was being worked on".

The whole episode was poorly handled, which is my entire point. By feeding the customers' desires for an upgrade to existing equipment, Atari created an expectation which they ended up not delivering on.

Another point: If Atari was behaving in a credible and responsible manner, there would be no reason for all the dissatisfaction that is rampant. There would be no reason for the volume of complaints and "venom".. Yes, I may be one of the most vocal critics, but you'll have to admit that I'm not by any means the only one.

As I've said before, give us something to be proud of (not you personally, but Atari Corp) and I'll be first to praise Atari for its accomplishments, as strongly as I criticize it for its shortcomings.

>Thinkin' in particular of the TT, when it & real Un*x is available.
Well, given that virtual memory and other wonderful things are available
on the '030, it shouldn't be too difficult. My understanding is that the
only reason that Mach isn't totally free yet is that it relies upon BSD,
which still has v7 code in it. I also was lead to believe that many folks
(GNU ones, supposedly) are working to "free" the rest of BSD, so the whole
shmeer can be given away. If this all works out, GNU may end up being based
on Mach. There hasn't been a GNU bulletin since this summer, so they may
have made some progrress since then...

>Is Mach PD?
I don't know what the restrictions are. Probably will end up being something
like those that accompany X11, I would guess.

RE: DataFree 2/4 meg mem board
Help! Datafree's instructions don't match the ground truth in a REV C
1040. Specific problems:
1. mmu and video shifter chips designations seems wrong.....not major,
but I need to lift some resistors to disable 1 bank of mem, Datafree
calls for R93 and R94, which I can't find, and I suspect their numbers for
these are whacko as well.
2. the little baby board that should plug into the video shifter's socket
hits two transistors (Q4 &Q6) and won't go securely into the socket. It
will clear these guys if I rotate the baby 180 degrees but that seems counter
the orientation shown in the instructions.

Added features..my version has what I think is the video shifter in a
rf shield and is labeled U49 w/ C070789-001 on the chip itself. If this is
not the correct chip, problem 2 above is cleared...these is another chip
of the same size close by, in the open labeled U15 C025913-38.

Any help given/mercy shown much appreciated. Thanks! j harris fairbanks/ak

I had a phone call from a guy the other day following up a discussion we had on Smalltalk/V for the PC. In passing I asked him if there was one for the ATARI ST. He said there was in fact a Smalltalk-80 system. Don't get too excited, it needs at lest a Mega ST4 to run with a large hard disk and will cost about 500+. Not for home use, at least in the UK! I can offhand remember the companies name, but he promised to mail me some information. When I receive this I will post a synopsis, if anyone is interested.

3202. Ultrascript - Available???

Newsgroup: comp.sys.atari.st
Date: 1989-11-23 16:09:31 UTC
From: dkhusema@immd4.informatik.uni-erlangen.de
Message-ID: <604@medusa.informatik.uni-erlangen.de>
Source record: 246674

Hi!

Some (4) months ago a couple of German ST mags had a review of a postscript interpreter called Ultrascript. Since of today I could not locate it here in West Germany I'd like to know wether it's available in the US and where I could order it? Also, does it include the fonts available on the LaserWriter II - someone from Atari Germany said so at the SYSTEMS '89 fair in Munich last month.

Any information is appreciated!

Dirk Husemann

>will be moving towards a OSF/Motif imlementation as well.

Does anyone know if the TT will be moving to Motif as well and how much an upgrade would be? There's no point in developing anything in X11 for the TT unless Motif or OpenLook are or will be available.

I am now running a Seagate 296N off my ICD. You can definitely hook up the
Seagate N series, as well as any Seagate that I know of.
>
>2) What Controller card apart from the adaptec 4070 and 4000(a) work with
>standard HD mechs(non scsi). IS there a WD, Xebec or possible OMTI substitution
There is an OMTI ... I think it's 3527, not sure. RLL.
>
>3) What turns out to be faster, an N series drive or a controller/HD combo.
N series by far. Embedded SCSI speeds things up bigtime.
>
>thanks for any and all help
sure... no prob
> -Ajay Choudhri
>
However. While I'm posting this, I have a question. I have an ICD host
adaptor, Mega 2 (with an older style DMA chip -- the original one would NOT
work with Spectre 128, ICD HA, and a Seagate 251 MFM drive w/ Adaptec 4000),
a Seagate 296N, and a Conner CP340 -- the same drive in the STacy, I'm told.
The problem: The two drives just will not get along. Both work fine by them-
selves (although I don't think I can format the Conner correctly; HDX 3.01
refuses to touch it -- I think it doesn't like my ICD HA). But when the Conner
at SCSI 0 and the 296N at SCSI 4 (friend of mine said he had troubles with ICDs
in that they wouldn't always recognize different SCSI configs) try to act to-
gether, strange things happen. The desktop usually works -- I dumped ~ 40 meg
of stuff no problems from the Seagate to the Conner and part of it back. I
try to boot Shadow, and after the reboot, I don't have any more hard drives.
Same goes for RATEHD and sometimes IDCHECK. Has anyone else had similar
problems? Now, I'm going to sell the Conner (or try to), since I simply can
not afford to fix my system so it can do what I want it to do.

Looks like the DMA bus is being munged, since it takes several reboots after
the drives go bye-bye before I can autoboot again.

(I'm using ICD 3.41 software)

Mike

3206. Slave BBS's

Newsgroup: comp.sys.atari.st
Date: 1989-11-23 16:48:57 UTC
From: econadm5@watserv1.waterloo.edu
Message-ID: <204@watserv1.waterloo.edu>
Source record: 246678

Slave BBS's are becoming more popular across Canada and the USA. What is a slave BBS? Simple, a slave bbs is a bbs run within a bbs. What is its purpose? Well, some sysops use it for hidden bbs's and others user it for elite status and other like me use it for programmers resource centres. To date Slave BBS's started in early 1989. Forem slave and QBBS slave are available on the Super BBS in Canada at (519) 749-1206 24hr 2400bd. (9600) on second line. If anyone wants to see how the SLave bbs's operate its open to the public for several weeks. The BBS has 250megs of file space and tons of up to date PD programs. Zip and Unzip,ICDboot4.21 etc.

For more info mail econadm5 at U of W. Sysop of Super (mr.fusion)

3207. Wanted Info on SCSI HARD DRIVE interfacing !!!

Newsgroup: comp.sys.atari.st
Date: 1989-11-23 17:34:34 UTC
From: shc1@ukc.ac.uk
Message-ID: <2608@gos.ukc.ac.uk>
Source record: 246679

Recently I acquired through various sources

1 ICD HOST ADAPTER
1 Western Digital (WD383R) 3.5" 30mb RLL HARD DRIVE
1 Western Digital (WD1004-27x) 8-bit RLL Controller card (XT Compatible)

Now my problem is that I wish to get these things going together,
what I know is that I could buy another controller board. i.e ADAPTEC or OMTI
However what I want to know is...

Is there such a thing as a IBM XT(controller) to SCSI convertor ?
(If so where may I get one) UK ONLY.

Is there any info on SCSI pinouts ?

Is there any info on the WD1004-27x pinouts ?

All replies will be welcomed with open EARS ...

p.s Thanks to all those who replied to my request for DIY memory upgrade info.

Uncle Sam.

3208. Re: Does a GNU C++ port for Atari ST exist?

Newsgroup: comp.sys.atari.st

From: ralph
Message-ID: <494@laas.laas.fr>
Source record: 246680

I've recently gotten gcc v 1.36 for my 1040 ST. Along with it I got
the following g++-readme.text file. Hope it isn't too discouraging.
I do not have g++!

The file came from terminator.cc.umich.edu. Before, I get flooded
with e-mail my gcc came from dsrgsun.ces.cwru.edu. That's all I know.

Cheers,

Ralph

p.s. signature at end.

-*- Mode: Text -*-

This is a very preliminary posting of G++ for the Atari ST. It's known
to be buggy, but I figured I'd post it anyhow, as a lot of people have
asked for it.

G++ needs LOTS of memory. Don't bother trying it on less that a Mega 2;
for large programs you'll need a Mega 4.

Unpack all the Zoos, (there should be 4; g++-exec, g++lib, g++lib2, and
g++-gnulib). All of these were packed in the \GNU\ directory, so
pathnames are relative to there. Look for a GNU.G file; and look for
the extra env vars that G++ will expect to see. Try building some of
the sample programs in the TEST directory.

Sorry about the brevity of the instructions; perhaps we'll do a better
job of documenting how to get started later.

`
` piet@cs.ruu.nl (Piet van Oostrum)
`In-reply-to: V053QHYX@UBVMSC.CC.BUFFALO.EDU
`
`If you could read German, you would have noted that changing the resource
`file is explicitly forbidden. At least it was in the first version (I will
`look in the current).
`
`Sorry about the odd way of quoting. I'm learning a different newsreader, but
`anyway, this is now saj speaking.
` I interpreted the notice the same way as Piet did. I said something about
`it to a native German friend, who couldn't understand what I was talking
`about. He re-read it, and said that he could see why I read it that way, but
`what it meant was that the authors of the compiler were absolutely not going
`to provide translations of the documentation or the resource. Of course
`he's a pretty cheerful fellow by nature, but unless another German says
`otherwise, I think what we have here is an idiom.

Well, I can't read it in any other way. But remember I'm not German.
Here is my translation:

Das Modula-2-System darf unter folgenden Voraussetzungen zur
nicht-kommerziellen Nutzung kopiert werden :

The Modula-2 system may be copied for non-commercial use under the
following conditions:

* Die Weitergabe erfolgt ausdruecklich zur nichtkommerziellen
Nutzung und kostenlos.

The distribution finds place expressly for non-commecial use and without
costs.

* Inhalt und Aufteilung der Diskette entsprechen genau der vom
LPR fuer diesen Zweck bereitgestellten Originaldiskette.

Contents and structure of the disk correspond exactly with the
original disk provided by the LPR (Chair for process computers).

* Es duerfen gegenueber der Originaldiskette weder zusaetzliche
Dateien enthalten sein noch Dateien fehlen.

With respect to the original disk, there should be no additional files,
nor missing files,

* Es duerfen keine Dateien veraendert werden. Dies gilt vor allem
auch fuer die Resource-Dateien und alle Copyright-Vermerke.

It is not allowed to change files. This applies before all also for the
resource files and all copyright marks.

* Es wird ausdruecklich auf diese Bedingungen hingewiesen, und
sie muessen als Datei "COPYRIGH.T" auf jeder Diskette
enthalten sein oder als Fotokopie mitgegeben werden.

There must be an explicit reminder of these conditions, and these must
be available as file "COPYRIGH.T" on each disk or provided as photocopy.

More follows about the non-availability of support and warranty

Although this translation has gone through a layer of Dutch, I still
think it is a faithful one. Note that some of the conditions imply others.

I'm selling my computer system. It's an Atari 520ST (naturally...you don't think I'd try to sell anything else on this newsgroup, do you? :-) with two single-sided drives, 1 megabyte of RAM, and TOS 1.4 in EPROMs. It also comes with a switchbox/cable combination that can be used with a Mitsubishi AUM-1381A Diamondscan monitor (multisync). There's also some software, like CAD-3D and Cyber Control. I'm asking $450 for the whole thing, but I'll accept the best offer made to me.

The system does NOT come with the Mitsubishi monitor. I've already sold it. But I do have the documentation for the monitor (photocopied) that I can send along with the system so that the cable can be modified or adapted for use with other multiscan monitors.

Those of you who are interested can reach me by e-mail. Thanks for your attention.

Re: Shareware Mac Emulator

To the creator of Aladin

Thankyou for the suggestion of making Aladin shareware, however the person who suggested that Dave Small had got the situation all sewn up and that there was no need of another mac emulator does not know the situation in Europe (well the U.K. anyway). Over here Aladin is the De-Facto mac emulator, it came out after Magic-Sac and in the U.K. it sold many more than the latter due to the fact that it had excellent support from Signa Publishing, here Magic Sac had little or no support. Things have changed recently, spectre 128 has been released but (as far as I know) GCR is not shipping generally. There was a rumour of Aladin 128 but it has not yet appeared but there are many Aladin users who wish to take this upgrade path and now it looks like the shareware path is the only way to go.
GCR is great (from what I have heard) but please do not stifle the development of another great product because a similar one already exists, otherwise we would be all using one computer (IBM probably) and driving one car (Reliant Robin (U.K. Specific joke)).

The Toshiba drives are quite reliable. Many people use them as
replacement drives. Personally, I had a problem with one when I tried
to hook it up to the ST. If you get one, make sure you have the ND-354,
or the ND-352A. The one I had problems with what the ND-352. I believe
they replaced that with the A model.

>
>The Australian dollar currently buys about 77 US cents.

$200 Australian dollars is about $154 dollars US, which is WAY more than
the drive sells for here. You can get them for 1/2 that price. A guy
in our user group paid $70 for a brand new one not a month ago.
Consider mail ordering from a US company, such as Lyco computer.

To fix the media change problem with homebrew 3.5 inch disk drives, run a jumper between pins 2 and 28 on the drive's 34 pin connector. I've found that using 30 AWG wire works well. Take a small bit of wire, and solder the ends to the back of the drive's connector. The even numbered pins stick out the back of the connector.

On some drives, this will cause the disk to be "permanently" write protected. My Tandy/Teac drive has this problem. My guess is that the signals aren't getting through to the computer. You might try using a diode instead of a wire, but that hasn't done much good either.

I'm not an electronics expert (yet), but this fix seems to work fine. Of course, TOS 1.4 fixes this problem, so you don't have to run a jumper.

Well, what in the world is he using it for? What do you want? I
have a Mega4 and a 1040ST and I like the Blitter. "Compared to the
Amiga blitter", please explain. Do you have both set up next to
each other and running the same program?

3225. How to determine if a pgm is called from the desktop (sample src includ

Newsgroup: comp.sys.atari.st
Date: 1989-11-24 08:04:35 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8911240804.AA11172@ucbvax.Berkeley.EDU>
Source record: 246697

Hello all,

... in an effort to return the Atari16 digests to discussions of a more technical nature, I'd like to report on my findings on how to determine whether a program was called from he desktop or from another program, such as a shell.

I wanted to be able to use a construct like "if (Desktop()) Cconin();" to enable desktop users to see messages from my program without forcing shell users to press a key each time the program terminates. The function should be as general as possible (ie. work with all TOS versions).

From older discussions and some hints in personal email, three possible ways to do this emerged:

1. The desktop puts an unneccessary CR (0x0d) character at the end of the command line when a progam is invoked from the desktop. If one finds such a CR stuck to the end of the command line, one can assume to have been called from the desktop.

2. Under the assumption that all shells set the PATH environment, one can test for existence of this variable, thus being certain to have been called by a shell.

3. If one finds the location of the parent process to be in ROM, the program was called by the desktop.

Method 1 fails if a shell (or other program, for that matter) tries to mimic the desktop too closely, or if someone@atari finally decides to get rid of such obsolete <beep> in future revisions of TOS.

Method 2 fails if a program is simply being called by another program, or if one has an auto-folder environment-setting utility (or the mythical env-set acc by Atari :-). One could argue that I could distinguish between shells and normal programs in this way, but (i) once a PATH entry is in the environment, it is passed down to all p_exec'ed processes, and (ii) it is the responsibility of the CALLING program to ensure that a p_exec'ed program can display its messages properly (my personal opinion).

Method 3, however, proved workable. Here are some source examples, with a description following. I have included ready-to-assemble versions for both CCD/ICD ST-Pascal and Borland Turbo C, for the benefit of those who don't want to delve into 68k assembler and still want to use the routine.

Der Worte sind genug gewechselt, lasst uns endlich Daten sehn:
(famous German quote)

return: movem.l (sp)+,a3-a5 ; restore work registers
rts
end
=== End of DESK-TC.S ========================================================
```

Now for the explanation:

First I get a pointer to the basepage of the parent process. Fortunately this is easy for both ST-PASCAL and Turbo C, since both compilers have a global basepage pointer that is filled in by the startup code. The Turbo C one is called _BasPag and documented, while the PASCAL one is called basepage and is undocumented.

There is a way to get such a pointer if you don't have one, but it's a little more complicated. We'll look at it in next tuesdays lecture. :-)

Now we want our subroutine to work with ROM and RAM versions, so we have to compare the parent process text segment pointer with the start and end of the operating system. There are ROM and RAM versions of TOS, and some RAM versions sit in low memory while others sit in high memory (for those who don't believe there are TOSes in high mem, I have one. It's a freely relocatable TOS 1.4 :-)

The parent process text segment pointer is easy: we just pluck it from our daddies basepage.

The start and end addresses of the OS are somewhat more complicated. The start address is found in the os_header, which is pointed to by the documented variable _sysbase. We have to use one indirection, since some hard disk driver software sometimes overwrites some of the RAM copy of the os_header. Since the 'real' header always points to itself anyway, it doesn't hurt. The end address of the OS is the real problem. There is no documented way to get at that, as opposed to the end of the OS *variables*. It turns out that the os_magic is always located at the end of the OS. While this is not documented, this holds true for all TOSes up to 1.4, the first ST/E TOS 1.6, and the TT TOS 030.

Big question to Atari: Can I rely on the fact that the os_magic entry in the OS header always points to an address at the end of TOS? If not, how do I get the adress of the end of the OS text segment? (I don't want to trust the text segment length data in the parent process basepage.)

With the last assumption, the rest is easy. See sample above. The code fragment should work with all compilers if the result return register is adjusted. As you can see, there's not really much of a difference between the PASCAL and TC versions: the basepage pointer is called differently, and TC needs some registers saved.

Moral: Please, let's all use the method descrived above to make life easier for people who sometimes use the desktop and sometimes use a shell (like me :-)

That's it. C&CC (comments and constructive criticism) are invited.

> host adapters. Tom Harker told me that this is why they are so
> generous in passing out their software, since only owners of ICD host
> adapters can use it.

Generous? Hah! I wrote them, asking a few tech questions and asked for an update. Nothing returned, except their new catalog. :-(Tom Harker told me in February (at CeBIT in Hannover) that they'd be in Usenet soon ...

I asked around here on the net, but noone would/could send me a copy. A well-meaning netter informed me that ICD restricts distribution of new drivers to GEnie, Compu$erve and their own BBS. He told me that in his opinion, the software was worth the d/l fee. I estimate d/l costs from Germany to be about $90, so I didn't follow his advice. :-) Unfortunately, I couldn't get email back to him. The German distributor for ICD, Herr Weide in Hilden, W.Germany employs a bunch of idiots who don't know a hard disk from a hard hat (no smile here).

Strangely enough, there's an old version of that same software freely avail-
able on one of the non-BITNET servers (forgot which one).

>4). The ICD formatting software from ver 4.xxx up is much more user-
> friendly than previous versions and is highly to be recommended. I

3228. More BLITZ information

Newsgroup: comp.sys.atari.st
Date: 1989-11-24 08:06:09 UTC
From: U009@CCIW.BITNET
Message-ID: <8911240806.AA11276@ucbvax.Berkeley.EDU>
Source record: 246700

Hi there again. A few minor points:

I find my UUEncoder on the PC damages the .UUE file if it gets bigger than 64K (sound familiar? segmentation?) and some of the archives I distributed generate a de-arcing error on the last file (which is only a copy of an advertisment in the original .ARC). I shortened the archive for future distribution (including the copy I sent to PROG-A16 at UOGUELPH.BITNET).

You must carefully watch the progress of the duplication for skipped tracks, double copies of tracks and loss of sync. Don't assume it copied correctly because you saw -77-78-79 as you turned your head. If in doubt, run it again.

I came upon the following information posted here by Mark Powell, <USQB015%liverpool.ac.uk@NSFnet-Relay.AC.UK>, on Thu, 20 Jul 89:

> ... About 35 seconds for SS and about 68 for DS. In theory this is an
> very nice device to own....
> HOWEVER!!!! I have a not been able to copy ANYTHING AT ALL with this
> device. I have an Atari 1M external drive A and a Advanced Software
> Technologies 1M external drive B, operating on a Nov 1985 520STM. Maybe,
> this is too old a machine for the device to work on... I don't know. I
> heard that the newer STs have a slightly different FDC, so maybe that is
> the problem. Can anyone advise?

I have a really old 520 (by North American Standards) 1985 ROMs too and it works fine from a ST314 (DS) drive to a ST354 (SS) drive, so the problem might be in the actual timing of the index pulse from the AST drive. Remember, the duplication relies on exact synchronism between the drives and some copy protection schemes we have analysed seem to rely on a specific, narrow range of byte count from the index pulse to the first sector header mark.

Well, if you are scoring, then I would think it depends on how much you want to spend. The most cost-effective way to go is a Mega4 and SLM804 laser, and the SM194 (?) big screen monitor. There's a PD graphics accelerator, and combined with the Blitter, it makes word processing with GDOS faster (for me).

The TT is a fine machine, but doesn't cost twice as much as the 4Mb laser system? If cost is not a problem, call an English Atari store, and order one.

(By the way, I know what you mean about scoring, I used to be a music major, and we used to have to do our projects by hand, and with india ink...)

1 Mb of memory in the 1040 STE, as I said it's is a slightly modified
1040 ST.
The same monitors as before. And as far as I can tell there's no change
in resolution either (I heard some rumours about it having overscan -- but
there's no way obtaining it in the desktop. If there is a bit somewhere,
it's well hidden. BTW, the way of removing the borders on the ST by
flipping scan frq don't work. The synch is different.)
RRP in Sweden is 6500 SEK ($1 ~ 7 SEK i think), but it's not hard to get
a discount of 10 per cent almost anywhere.

Message-ID: <63300005@uicbert.eecs.uic.edu>
Source record: 246605

I brought UltraScript from a place called Computer Cellar located
in St. Charles IL (USA). It cost $175.00 and has Lucida fonts. Other
font packages are available such as Times Helvetica, Courier etc. with
prices ranging from $100.00 to $150.00. UltraScript and the fonts are
available from:
IMAGEN Corporation
P.O. Box 58101
Santa Clara, CA
95052-8101

(800)-635-3997 to order by phone.

I have UltraScript and it works great, only you need at least 2+ Mb of
memory for it to be useful (it will not even work on a 1 Mb ST with TOS
in ROM!). Hope this helps.

3234. LaTeX for ST with SLM804 ???

Newsgroup: comp.sys.atari.st
Date: 1989-11-24 10:38:55 UTC
From: dillenbu@uicbert.eecs.uic.edu
Message-ID: <63300006@uicbert.eecs.uic.edu>
Source record: 246606

I have downloaded most of the TeX distribution from the Terminator
archive in the hopes of being able to run LaTeX with a 2.5 Mb ST and
SLM804 Laser Printer. I was encouraged to find a program called
DVISLM made by Tyler Ivanco but it needs fonts I am not able to find
anywhere. For instance, when I run it on the included doc file
dvist.dvi, I get an error stating "Unable to find file
f:\fonts\cmbx10\351pk". I have fonts for the 96dpi DVIST program and
300dpi fonts from DVIDSK and have placed them in the proper directories
with the proper filenames, etc. I have looked through the full 5Mb
TeX distribution and still I cannot find this font. I now have the
feeling I am overlooking something. I am not familiar with METAFONT,
is this what I need ? I am only familiar with LaTeX and I have used
a DVIALW converter on VMS. ANy help would be greatly appreciated,

I will. But tell me one thing. Why not post any such upgrades to the net immediately as they're ready? It can't be that expensive, but very appreciated.
So as with any information concerning Atari Corp. -- I can, for example, see to that the ST magazines in Sweden will get a copy. If you're not consider it worth it, posting to the net - well, drop me a letter or set up a mailing list!

You've got an opportunity to get the right information to the right places here - no screwed up rumours. Oh no, the real stuff direct from the source. And fast!

>internal AES and Rsconf() bugs - are fixed in STE TOS. The screen
>behaviour you describe sounds very strange. It could be a hardware
>problem (a bad BLiTTER? I don't know - I'm not a hardware guy).

Probably a bad BLiTTER, yes. I've tried it out and exactly the same action works with the other STE -- but not with this particular one. Leaves some bits left in one bitplane. Sigh, I'll have to turn it in for a guarantee repair...

Thanks a lot for you reply, and keep up the hard work. I think you are to few people on to many projects.

3240. ST TeX questions

Newsgroup: comp.sys.atari.st
Date: 1989-11-24 17:42:22 UTC
From: saj@chinet.chi.il.us
Message-ID: <1989Nov24.174222.1206@chinet.chi.il.us>
Source record: 246612

I've been poking around trying to get a complete TANGLE / WEAVE /TeX / Metafont system on my 1040 ST for a few weeks now. I can supplement it, when needed, on a VAX where a lot of it is available too. Now I have a few 'Where can I get' questions, and one 'Where did I get' one.
First: this is really eating me--I have a file atari.mf. I must have gotten it either in this newsgroup or from comp.sources/binaries.atari.st. But when I browse my archive files, I don't see it anywhere. Does anyone know where it came from? (it was one of the files loaded into inimf to make the plain.bas which I have from cm_mf.arc).
More seriously: I can't ftp. Where do I get dvieps? Also, would it be reasonable for someone to post a virtex.ttp and a plain.sty to comp.binaries.atari.st?
For what it's worth: TANGLE and WEAVE work fine with Personal Pascal, using the long integer option and a few rather obvious redefinitions (text should be called text, not textfile; correct default case). The compiler has to be told you want a lot of stack/heap (or is that the linker).
Steve J.

3241. GEM help

Newsgroup: comp.sys.atari.st
Date: 1989-11-24 18:21:44 UTC
From: daren@umbc5.umbc.edu
Message-ID: <2550@umbc3.UMBC.EDU>
Source record: 246613

I wrote a little program to pop-up a menu whereever the left mouse button is clicked. The menu consists of a hand-built object tree, basically pretty simple stuff. The problem I am having is with the mouse pointer!! I know that the AES records the # of times you GRAF_MOUSE(M_OFF, 0L), and that you must issue an equal # of M_ON's to restore the mouse. My question: Is there anyway to over-ride this mechanism? If not, is there a way to find out how many times the mouse has been hidden (not counting mousehidden in msh!).
I am using MWC 3.0.5, a .5meg ST, and the tos 1.0.

Any help would be greatly appreciated!

thanks,
-Daren daren@umbc5.umbc.edu

3242. Kermit for the ST.

Newsgroup: comp.sys.atari.st

Hi there ..

I'd like to incorporate Kermit into my Flash152 term program.

1) Is this possible?
2) Where can I get it a copy (if you have one that you're willing
to send, please respond by e-mail).
3) How do I install it?

Thanks in advance,
Marc.

I hope Apple doesn't see that. You could/would be in mucho big trouble if they did.

I kinda hope that this shareware Mac thing specifically checks for illegal ROMs.

Mike

3244. Just to settle a few points...

Newsgroup: comp.sys.atari.st

(my previous stuff starts w/ '>>')
gl8f@astsun.astro.Virginia.EDU (Greg Lindahl) writes:
>> [i have to toss my software investment to upgrade to current
>> levels of CPU horsepower]

>Well, this is a problem everywhere. Talk to all the science types who
>bought VAXes in 1980 only to have to convert to Unix because DEC wouldn't
>sell them fast boxes. And then DEC starts making fast VMS boxes again.

Agreed. Mind you, we bought a VAX11/780 in 1981 and had the wit to
run Unix on it from the start ;-). So it's been pretty painless.
We're up to a DS3100 and Sun 4/370, so far, plus about 30 other
machines. The VMS guys get all weird whenever I talk about running a
few benches on our VAX 8820 :-) :-). Don't want me to install Ultrix
on it, I guess.

>>opportunity to ignore me, and to slant their market offerings to
>>buyers at the low end, without losing the sale, and with no loss to

>Er, the TT isn't really much of a "low end machine" in any configuration.
>You can't sell millions of home computers if they cost over $2,000. So you
>have a curious definition of "low end".

Oh, sorry. My minicomputer/workstation background is showing... low
end is anything under $5k, and is meant in relation to machines
capable of running un*x comfortably (> 4 Mbytes ram, > 80 Mbytes
disk; I've seen it done with less [much less] but that's not my idea
of a pleasant working environment). I think of all machines sold in
units of a million as low end. Nothing curious about that - it's a
pretty common opinion around here.

>Atari's marketing policy was good. I've only been playing devil's
>advocate and pointing out obvious flaws, hoping that the flame war
>will end.

Gee, I hope you don't think I was _flaming_! (1/2 ;-). 99.5% of what
I've said is from personal experience, painfully acquired. The truth
is never a flame.

>And, yes, I have a big investment: about 1/3 of my total material
>possessions is my ST. However, most of the software I use (terminal
>emulation, LaTeX, Maple, Fortran) is portable elsewhere. I've spent
>some time understanding GEM programming, but that is useful when I
>program on other windowing systems. I got what I paid for in the first
>place.

Now, let me see, you claim to have portable Maple and Fortran compilers that run on other machines and on Atari STs? Nice, but hard to believe. And terminal emulation code that runs on both ST and other platforms? Well, it wouldn't be _that_ hard... the LaTex claim _is_ credible. As far as understanding wondow systems from GEM, ok - but I was talking about all the time I spent finding the bugs and devising workarounds. That's time lost if I port.

I've got lots of source code too; I'm a programmer by trade; I'm bitching about losing my application packages that I have as binary licensed stuff - all the desktop publishing, for instance (yes, I have TeX and LaTex too, just don't use them much). I can port my sources easily, it's having to get new compilers and libraries that annoys me. Ditto my database stuff - bringin the data forward will be a pain, and I'll need to buy a copy of dBase(d) or somesuch for $$$.

>>I want to buy a real high-end cpu/video section. I don't see it yet;
>>the tt/p comes close but lacks expansion.

>Wait until you see one. Then you'll know enough to make this statement.

OK, flame on...

This comes under the heading of teaching your grandmother to suck eggs. Your condescention really bugs me. I've been in this business since 1973, I program for a living, and a 2nd year student who never met me informs me that I don't know enough to form a personal opinion and loftily advises me to wait for more information. &$@#~!!! Have _you_ seen one? I'm looking at a 1024 x 860 display right now (Dec VaxStation 2000 + VR260A); I have a 1132 x 980 x 8 plane display sitting beside my left elbow (Sun 4/60-FGX-8). These machines are _mine_, I work with them all day every day and I don't share them with anyone. Ghods almighty, I've read the specs for the tt/p. I've read more than a few specs in my time, and _built_ a few computers too I might add, and how many displays do I need to look at before I decide that 640 x 480 x 4 planes isn't quite what I want !?!? Any competent [23]86 clone can do 800 x 600 x 4 planes with off-the-shelf hardware, and I don't think of something you can get at the local Clones-R-Us as high end. Mind you, the mono is fine - 1280 x 960 is pretty good.

Flames mostly off...

I'm used to high performance systems and good support. I bought my 1040 because it had a decent cpu in it (in 85, a 68k was pretty good given the price), it had a flat addressing space, and I knew it would be easy to shove in more memory. That, at least, has worked out. Besides, I loathe int*l ;-). And the mono display wasn't too bad atall, _in 1985_.

But the software support has been utterly dismal, and we're still at 1985 performance levels. Meanwhile the rest of the world can run their 1985 code at 198[89] performance levels, if they want to run their 1985 code; or they can run new stuff if they've got it. They _don't_ have to pitch all their software/data/training investment to

upgrade the hardware platform.

The tt/p lacks expansion, period. I've seen the spec, and I _define_ that spec as lacking sufficient expansion capability _for me_. A SCSI port plus one partly-implemented VME slot, indeed! Hoo boy...

I think the tt/p will be a real nice machine _for some people_. I'm just not one of those people. And since I want a TT for my house, that makes me a home user. So I feel my earlier statement that the tt/p is not right for some home users stands, and I still feel left out in the cold.

This all goes to show that if you have personal opinion someone else is going to interpret it as a criticism of _their_ opinion, and as a command to change theirs toute de suite.

>Of course, I don't know if the '030 can handle different bus widths.
>My Moto books aren't that recent.

It can, and does a very nice job of it; it can resize the bus on
a cycle-by-cyle basis. So you could have local 32 bit wide memory
on the 68030 daughter card plus a 16-bit wide path to the ST mem
section. This would work very nicely if you were careful to keep
this like PhysBase and the DMA pointer pointing into ST memory -
it would be easy to hack ST-Minix to do this.

I almost _do_ hope that apple saw that. Usenet, and especially
comp.sys.atari.st certainly don't need that type of thing. If people have a
short enough memory, piracy was a part of what killed the 8bits, and
it has allready threatened the ST's product line (The wp scare, etc.)
The people that used to make the 8bit happy copier (Don't know their name)
pulled some similar shit by creatin a cartrige that was all set to accept
apple ROMS (and, infact, the person at the show booth was quick to explain
how to copy the ROMS onto EPROMS), and was very ready to pass out copies
of Dave Small's Software. Definately NOT something I'd want to come close
to, let alone support. I hope you, dear generic student, rethink your
position FAST.

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

This is an urgent request for help. My wife and I have just bought the LDW POWER spreadsheet, and one of the supplied utilities is corrupt.

The utility in question is the one that converts from .LDW format to .WK1 format. This routine is vital to my wife and we are upset that it doesn't work, we tried the retailer, but he only had the one copy in stock, and he wont accept the package back. We specificly bought the package when we discovered that it was Lotus 123 compatible. Apart from this one problem the package is excellent, however we _*REALLY*_ need the convert program!! I wondered if anyone out there could help me out by mailing me a copy of the convert program? It would be so amazingly wonderful, that I would be really happy! (I hope I'm allowed to ask reqests like this! But I did buy the package in the first place!! :-)

Regards,

TMRF

yes - the omti 3527 is RLL and works fine other RLL drives, but for some
unknown reason you get 5MB less than on a 4070 when you format any RLL
drive. Adaptec 4070a drives are what I'm running on Super with a Miniscribe
RLL drive. It's been working for over a year now, no problems.

>
>(I'm using ICD 3.41 software)
>
>Mike

If you're using the new TOS 1.4 call ICD and get the latest booter as 3.41
doesn't operate properly with TOS 1.4. Recheck your cables, and try
disconnecting your drives from the system when it crashes next time to see
if it's REALLY the drives causing the problem and not something else. Often
a controller can get confused with power spikes and system power has to be
shut down completely.

Of possible interest to people with two ST's and a large hard drive, I have
been experimenting with ICD's host-adapter and have successfuly hooked up
two STs to 1 host adapter system with two hard drives on it. I even ran
BBS express with both of them at the same time. I'm wondering if ICD is
coming out with a dual-DMA bus access for us sysops with 2 STs? Anyone
out there heard of hooking two STs to a one-drive system?

>you wanted to.

When Neil Harris was an Atari employee he mentioned on GEnie that the blitter upgrade would be available to 1040 owners. He did not just say that it was "being worked on". Atari failed to deliver. Atari's behavior is familiar to those of us who owned Commodore computers during the Tramiels' tenure there. Products were shown at trade shows but never delivered, the FCC was blamed for late products, etc. At least the Tramiels' Commodore sold millions of the products it did have, something that the Tramiels' Atari has not been able to do. The machine I thought would be the "poor man's Mac" turned out to be "the rich man's Commodore 64." I must say, though, that the hardware is much more reliable that the C64's and it's a lot better for C hacking.

Hello,

I'm looking for a possibility to set the mouseposition inside a program.
Also I want to program the mousekeys.

This is for using a joystick or another media to simulate the functions of
a mouse.

The program should work in the desktop and also within other programs like
CAD-programs.

Who is able to tell me how to do this ????

Please answer vi e-mail because I'm forwarding this to my friend who wants
to get this information ...

>
>Rats! I looked up the possible seek rates last night, 6 msec is as slow
>as she goes.

Hmm, TOS will step at 6,12,2,3 msec (with rate codes 0,1,2,3).
Setting the controller to 6 msec and doubling the clock works for almost
all 3.5 inch HD drives.

>It would also be hard to boot from a floppy with this
>mod (double - 16Mhz - clock for 1772 + formatter + "6"msec seek rate).
>Do you have to have a seek rate setting boot sector on every boot
>floppy and would that idea even work?

Sure, that should work, since nosteps schould be necessary to read the
boot sector.
I boot from harddisk...

If the HD-floppy does not work after modifying the ST, the step pule
width is a probable cause.
In that case, use an edge-triggered monoflop to "resize" the pulse.

3258. HELP : How to connect the ST to my terminal socket via RS232?

Newsgroup: comp.sys.atari.st
Date: 1989-11-25 17:16:08 UTC
From: zmacy64@flamingo.doc.ic.ac.uk.doc.ic.ac.uk
Message-ID: <1384@gould.doc.ic.ac.uk>
Source record: 246630

I am trying to connect my ST to a terminal socket, which is connected
to a PAD linked to JANET. I tried all possible
connections but nothing seemed to work. I used the UNITERM terminal emulator
and Kermit protocol.

Is there anybody out there that can help me? I would really appreciate
this...

I have an ATARI 520-STM with the TOS on ROM.
The terminal socket has the following PINS :
2,3 : Receive and Send data
7 : Signal ground
20 : DTR

I was told to wire PINS 4 and 5 of my ST together, PINS 8 and 20 of my ST
to PIN 20 of the terminal socket and PIN 7 of my ST to PIN 7 of the
terminal socket...

I also do not know how should I configure my RS232 port. That is, should
I have Xon/Xoff, Rts/Cts, Stop bits, Strip bits etc?
I read in the news that there is a problem in the ATARI ST O/S for handling
properly the RTS/CTS signal. Could this be probably be the fault?

I would really appreciate some kind of help.
THANKS IN ADVANCE...

Hi,

Either ATARI employees or people with technical knowledge could help with this.

There is a problem with the RAM on my 1040ST.
Running the program TESTMEM I get the following error messages:

Address: 801FE written: A000 read: A800
Address: 801FE written: A001 read: A801

and so on, where the above bit is always on.

My motherboard type is:

C070523-001 REV.C
G-AV-O 2086

and the ram chips are labeled:
First row: U46 ... U61
Second : U32 ... U45 U16 ... U30

Can anybody tell me which RAM chip needs to be replaced?

Thank you very much,

Thanasis

3261. Xenon2 and Blood Money vs. TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-11-26 05:05:59 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891125.23055881.010913@SFA.CP6>
Source record: 246633

Has anyone been able to get Xenon2 and Blood Money to work with
TOS 1.4, including the magazine version of Blood Money?
I've had no luck here. Other games, such as Dungeon Master and
Air Ball work just fine. Spectre GCR works fine with this particular
ST and TOS 1.4.
It's just that the two aforementioned games don't work at all for
me. Surely European programmers follow Atari's undocumented rules
and holy TOS paramaters better than this! Am I the only one or are these
two games incompatible with TOS 1.4?
Please respond direct since INFO-ATARI16 is dead as a magazine. I'll
be glad to summarize.

> dillenbu@uicbert.eecs.uic.edu

This is not true today, it was true about 5 months ago. I finished a
version called UltraScript ST-1, and it does work on a 1 Mb ST.
(Mind you you will be strapped for RAM, i.e. NO TSRs that eat RAM, I need
it all).

Hedley

PS: If you have questions about the ST versions of US, I did the port so
feel free to ask.

Hedger@inmet.inmet.com

1 - There is a document which floats around describing all the bits and pieces of the DESKTOP.INF file. Will have to locate it, but yes you can message around with SOME of it. Some of it is self-explanatory. Will check for my copy and maybe upload it, unless someone beats me to it.

2 - GDOS - Get G+PLUS instead if you really want to play with GDOS applications. Currently only a few commercial packages use it, and only 1 PD or Shareware package I know of (OPUS - Spreadsheet)

3 - Corner clock - Yes it is possible to do one. Have seen several types which use digits, and JCLOCK8 is the most robust one I know of. Don't recall seeing the other kind implemented with the clock hands display. Go ahead. Can always use another version.

3265. Personal Pascal

Newsgroup: comp.sys.atari.st
Date: 1989-11-26 06:54:27 UTC
From: hugh@dgp.toronto.edu
Message-ID: <1989Nov26.015427.4432@jarvis.csri.toronto.edu>
Source record: 246637

Personal Pascal is a Pascal compiler for the ST. Early in the ST's life, many programs were written in it, but it hasn't been mentioned much recently. I have just used it in a couple of projects, so I thought it would useful to describe my impressions and experiences.

PP (my abbreviation for Personal Pascal) is published by ICD, the same people who produce hard disk systems, kits, and tape systems for the ST, and a bunch of stuff (hw and sw) for the 8-bit Atari computers. PP was published by OSS until they were taken over by ICD. The compiler itself was produced by CCD, and they publish it in Europe.

Because of the change in publisher, some people don't seem to know that the compiler is still published and maintained. I just got an update from Version 2.02 to version 2.05, at a cost of US$10.

Most programming I have done in the last 15 years has been in C. C is the defacto-standard language for programming the ST. Why would I choose and use Personal Pascal?

- Pascal is a reasonable high-level language that can be compiled into efficient code. True, Pascal has some limitations that bother an experienced C programmer.

- Personal Pascal seems to be a competently done implementation of Pascal. It includes a reasonable editor and linker. It has a sort of desktop which integrates the editor, compiler, and linker.

- The system is compact and efficient enough to use with a single-floppy system (I have only tried with a vanilla 1040 -- 1 meg of RAM (with a large RAM disk) and one 800K floppy, and with the same system + a hard disk).

- The library seems to simplify and clarify the task of exploiting GEM. It has hooks for getting at the basic BIOS, XBIOS, and GEMDOS services too.

- The linker will link object code files in DRI format (Developer Kit format). You can link in modules compiled by other compilers or assemblers.

- There are some UCSD Pascal / Turbo Pascal variable-length string handling features. This is the area with which I am least happy, but they work.

- The ST has insufficient memory protection to prevent buggy programs from clobbering arbitrary parts of the system, including

RAM disks, disk buffers an caches, desk accessories, etc. Pascal programs can be compiled with array-bounds and pointer checking so that accidental mayhem is prevented, and the point of violation is detected and reported.

- The complete system is inexpensive: the list price is US$99.95

Using this system has been much more pleasant than my attempts to use the Developer's Kit C (Alcyon 4.14). Why?

- The documentation seems better: all in one 1-inch thick, "perfect bound" manual, versus my inaccurate (but more detailed) Developers' Kit (5 inches of loose 8.5 by 11 paper). For more detailed documentation, there is the "Tackle Box".

- The compiling process is much faster (one-pass) and easier (click the "compile" menu item). When the compiler detects an error, it will (if you ask) pop you into the editor with the file in question loaded, and the cursor at the token at which the error was detected.

- My mistakes are caught earlier: Pascal's strong typing catches many bloopers at compile time; run-time checking catches many of the remainder.

- The system is organized in a simple, straightforward, useable fashion. Much better than the Developers' Kit.

ICD provides phone support, and has a BBS for support. I have tried each, once. From this, I cannot judge their quality, but I do know that they exist. They distribute a bug list; it may not be complete, but it shows an attitude I like.

For heavy-duty ST hacking, SRM Enterprises produces something they call the "Tackle Box". It is specifically designed to complement PP. It is an enormous 3-ring binder full of ST internals lore, much in the spirit of the Developers' Kit. It also comes with a bunch of routines and programs on disk. Its price was US$69, a bargain.

UNITERM is compiled using CCD's version of this compiler, so system hacking is certainly possible using it.

What's wrong with Personal Pascal?

- Pascal hasn't taken off as a common language on the ST, so most source that comes across the net, and most tutorials, seem to require a C compiler. There are few people to ask for help. David Meille once wrote and broadcast over USENET several parts of a PP tutorial.

- The string handling routines have silly restrictions. In particular, you cannot give them arguments that are string expressions, so calls cannot be nested. Some cannot even take string constant args. These restrictions are documented, but not

highlighted, and they are not what an experienced programmer would expect. The compiler does not give compile-time diagnostics about violations. Instead, it generates code that does the wrong thing at run-time! As you might gather from this tirade, I was bitten badly by this problem.

- There is no symbolic debugger. I only felt I needed one when I was tracking down problems with the string handling.

- Picky detail: When TOS is requested (via a system call) to print stuff, and the printer does not respond for 30 seconds, TOS gives up and returns an error indication to the caller. The PP library seems to ignore this error return, so output can be silently lost.

- Apparently OSS didn't pay CCD royalties for some time, so CCD stopped supporting them. I hope that this has been dealt with now ICD has taken over. Lots of stores seem to have old PP stock. [In Toronto, we have about a dozen stores selling STs; several are quite good.]

>credibility.

Well, the BLiTTER is availeble for 520 and 1040 ST.
Not from Atari; but arn't we used to get things promised by Atari and
sold by some third party developer?

I have a BLiTTER in my 1985 520ST+.
Got the board from a german company (Rolf Rocke Computer), the chip
itself as "spare part" from an Atari dealer.
The board is around DM 150, the chip almost the same. (a dollar buys DM
1,7910 today).

Well, I think a 16 MHz CPU and Quick ST (this very nice little shareware
program) will perform better (but be more exspensive).

Tramiels' Atari HAS sold quite a lot of ST's, for example. In Europe.

Hmm. Wouldn't you consider a machine that can run MAC software and is
cheaper than a MAC a "poor man's Mac"? I would. (I have been satisfied
without a MAC emulator, though.)

A recent article suggested three possible methods by which a process could determine whether it was being run from the desktop or from a shell. I'd like to suggest another method which works for me. I don't suggest that it is foolproof however. It simply requires moving the basepage ptr up to its parent until it becomes null. If this requires three iterations then the program is running from the desktop. Any more and it is running from a shell.

The following piece of code works with MWC:

```
int fromdesk()
{
BASEPAGE *bp;
int i = 0;

bp = (BASEPAGE **) BP->p_parent;
while (bp != 0) {
i++;
bp = (BASEPAGE **) bp->p_parent;
}
return (i == 3);
}
```

From article <641@nixpbe.UUCP>, by capit@peun11.uucp (Capitain):
> I didn't receive any answer at all to my first mail.
> Is there really no interest in a shareware mac emulator???
>

YES!
We are interested in a shareware mac emulator, if it supports the 128k roms.

(I have had no luck with uucp addresses, which probably means others have
tried to reach you through e-mail and failed also!)

BUT I am not interested in paying $10 (for the cart) $150 (for the 128k roms
or $50 for 64k) plus the $30-$40 (shareware fee) that you deserve...

If I wanted a 64k rom mac emulator, I could pick up a Magic Sac plus, WITH
roms!!, for approx. $40 !!

The reason I don't own a Spectre GCR, =Sigh=, today is cause I don't have
the cash!!! (but OH do I want one!!!)

****

Now, if your product supported the 128k roms, sound, an easy AND compatible
way to bring MAC files to it (I find the magic format acceptable), and any
other bells and wistles you'd like to add, I would be INTERESTED, BUT NOT
A BUYER.

We have determined that something is wrong (for lack of a more exciting word)
with the cart. port on my 1040St. Thus, digitizers, 3d glasses, roms for
emulators, and anything else you can think of (that fit into the cart. port)
are useless to my machine.

I am saying that supporting 128k roms on disk, would help me, and would most
likely make me a SUPPORTER of your shareware product. (I'm not telling you
that you should give out the 128k roms file!!)

Others with working ports want to keep them in that condition by keeping
cart swaps to a minimum (I did NOT wear out this port, but I have worn out
the ports in my INTELLIVISION and my TI-99/4A <GRIN> {remember those?}).

That is how I feel,
that is what I want,
and this is where I am:

> [more]

I don't often find time to read this group now, but then things don't seem to change much anyway..

How long have Atari kept the UK waiting for this now?
They should realise that it's a very simple matter to make bootleg EPROM copies of the 1.4 ROMs, and install them. If it becomes widespread, it will be no less than they appear to deserve.
They obviously place *some* value on the UK market, they're spending on TV advertising, and that's definately not cheap!

>
>Now my problem is that I wish to get these things going together,

Hooking it up should not be very difficult. You will need a SCSI board.
For an RLL drive, you need an Adaptec 4070. They can be had for as
little as $70. The connections are:

1) drive to Adaptec: (1) 20 pin and (1) 34 pin cable.
2) Adaptec to ICD: (1) 50 pin cable.
3) ICD to ST: Use the supplied 19 pin DMA cable.

The software with the ICD will do all the formatting. However, I don't
recall them listing Western Digital drives. You will need to know the
head/cylinder configuration to format it.

Hope this help.

j.harris asks, about the DataFree memory upgrade board:
> 2. the little baby board that should plug into the video shifter's socke
> hits two transistors (Q4 &Q6) and won't go securely into the socket. I

Most of these kinds of upgrades have to be generic enough to fit any ST motherboard. They generally require a bit of pushing and bending to get them to fit. It may be possible to *very carefully* bend the transistors down closer to the motherboard, being careful not to let their leads touch or break. I had to do this to get the AERCO upgrade to fit. One installatio I did in an STFM had an electrolytic capacitor in the way, which I ended up relocating to the back of the motherboard. Every case is a little different.

> Added features..my version has what I think is the video shifter in a
>rf shield and is labeled U49 w/ C070789-001 on the chip itself. If this is
>not the correct chip, problem 2 above is cleared...

The video shifter chip IS the one inside the small metal RF shield. You may have to do a little creative bending of the shield to get the ribbon cables through the cover, if you want to put it back on.

As for the problems locating the proper resistors to lift, I'm afraid I can't offer any help. I don't remember seeing a Revision C board. I know it's a long, long distance call, but it might be best to call DataFree and see what they say about it...

Source record: 246647

Given that no one else has spoken up about it, please let me tell you why I am strongly *against* this idea of a shareware Mac emulator. Before flaming, please read on!

- It would hurt the ST. David Small has done a great job with the Spectre, and sells it for a reasonable price. Quite frankly, I would like to seem him continue to develop fine ST products such as the '030 board some have been discussing. The creation of a free alternative to his Spectre would not encourage this. (Note, I am not connected with Gadgets By Small.)

- A shareware emulator wouldn't be a lot cheaper. Keep in mind that in order to avoid the wrath of Apple, one would still need to make a PCB and buy *original* Apple ROMs. Given that the ROMs typically cost over $100, this is more than half the price of a Spectre anyway.

- The effort could be better expended. Let's face it: it's hard to write an emulator like this. It's taken Dave Small a long time to get his working as well as it does. Given that there are so many things we in the ST world lack, it would seem that one would better serve the community by working on something that hasn't been done before. In the area of Mac emulation, for example, it would be great if people would band together with Dave Small to get '030 Mac II emulation going, as well as AppleTalk and MIDI support. In this way, you'd get paid for your labor, and I for one would be even more grateful and impressed.

Given that I myself am a mere observer on this project, please consider these as friendly suggestions. I'm not making demands; you can spend your time as you wish!

To ST programmers/MIDI experts,

I am trying to write a patch librarian for a 520STFM and a Roland D-10 keyboard. I am having problems because the input buffer on the ST isn't large enough to hold the 256 byte blocks that the D-10 sends, and unfortunately, I don't seem to be able to write a program which will snag data from the buffer fast enough to prevent it overflowing.

Basically, my problem is this: I need to change the size of the MIDI input buffer on the ST from the default 128 bytes to 256 (or more) bytes. Does anyone know how to do this?!? Better yet, does anyone know of PD MIDI librarians?

Thanks,
(and DESPERATELY yours,)

Andy Dickinson

...

Wait-a-bloody-second-here...

Does this mean that I should not go out and write a share-ware
<insert generic type of program here> because it might hurt
<insert generic software house/publisher/author>'s business?

I find it rather difficult to follow this "logic". Insert "1-2-3" and "Lotus" in your paragraph for "Spectre" and "Gadgets by Small/David Small". Would you be so sympathetic for someone else?

Please don't take me wrong. I think that David Small has made a contribution to the ST-world. However, I do not believe that he deserves a monopoly on the business. The "Shareware mac" would not have the support of David's product. Some people would pay the extra bucks, just for the support.

[Note: I am not a customer of Gadgets by Small. (or Lotus :-)]

|
|Wait-a-bloody-second-here...
|
|Does this mean that I should not go out and write a share-ware
|<insert generic type of program here> because it might hurt
|<insert generic software house/publisher/author>'s business?
|
|I find it rather difficult to follow this "logic". Insert "1-2-3" and "Lotus"
|in your paragraph for "Spectre" and "Gadgets by Small/David Small". Would you
|be so sympathetic for someone else?

You should not go out and write a share-ware version of someone's
package IF you are *worried* about hurting their business. My point is that,
given the very small size of the ST market, we *should* be worried about
GBS's future. I'm not saying that it is morally wrong to write a shareware
Mac emulator; I'm just saying that writing it will hurt GBS, and given
the small size of GBS and the quality of their products, it is not in any
ST user's interests to hurt them.

By the way, the analogy to writing a shareware version of Lotus is not quite
applicable. Given the size of the IBM market, a shareware version of Lotus
isn't about to bankrupt anyone. Also, a shareware Mac emulator is likely
to be functionally very similar to the commercial product, whereas the
shareware Lotus is likely to be much worse. But whether or not what I
say in this paragraph is true or relevant, it does not take away from
my initial argument that we should all do our best to support GBS, because
GBS is important to the ST.

In article <1273@atha.AthabascaU.CA> rwa@cs.AthabascaU.CA (Ross Alexander) writes:

>Now, let me see, you claim to have portable Maple and Fortran
>compilers that run on other machines and on Atari STs?

No, that's not what I said at all. I can buy Maple and FORTRAN for other machines; so when I want to move the source code I have in FORTRAN (which is worth much more than the compiler) doesn't have to be re-written. This is a pretty standard definition of portability.

As for the rest of your post: sheer flames in email please. I think that maybe joe average comp.sys.atari.st user isn't so interested in how many years you've been using what computers. Just because the TT/P isn't right for you doesn't mean you should tell the whole world about it in comp.sys.atari.st... We've already heard from Mr. Convert repeatedly on that subject.

Your mileage may vary. Don't buy if you don't like it.

3281. Re: Vapourware!!!

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 04:45:01 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24502@cup.portal.com>
Source record: 246553

Just to clear up what seems to be a general misunderstanding:

David Paschall-Zimbel says:
>Yes, I was around on GEnie back in the good old days of 1986. No, I don't
>remember reading anything which was labelled "OFFICAL PROMISE" from Neil
>Harris.

Neil Harris was the *OFFICIAL* representative of Atari Corp. *ANYTHING*
he said, unless specifically accompanied by a disclaimer to the contrary
was *OFFICIAL* from Atari Corp.

It was HE who _insisted_ on adding the wording "Official On-Line Service
of Atari Corp" to the log-on message. He enjoyed the limelight and perks
of being the "Official Atari Rep", even thought he generally tried to
duck the responsibility and work that went along with them.

Atari Corp *themselves* acknowledged his "official" capacity several times
when they came down on him for overstepping what they wanted revealed to
the public. The premature release of pricing on the Megas was one of these
times.

So when Neil Harris would say something like "the Blitter upgrade will cost
$120 including the daughterboard and TOS 1.2 ROMS, and it will have to be
installed by a local dealer", this was *NOT* just some flunky employee
spouting off unofficial rumors.

Yes, I *do* have copies of virtually everything that went on during that
time, including public messages, conferences and private "nasty-grams"
from Neil Harris. No, I don't plan on wasting my time searching them just
to fill in faulty or selective memories.

Most people did not attend _every_ conference, or read _every_ public
message. I did, and I heard enough claims and announcements of the blitter
upgrade from the "Official" Atari Representative.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24506@cup.portal.com>
Source record: 246554

Well, it finally happened.. I managed to dig out something positive about Atari and the newly announced Atari products.

One of my pet peeves has been the closed ended, non-expandable design of the ST when it comes to memory. Apparently Atari has done an about-face on this issue though. The product announcements for the STE indicate that the computer will be internally expandable to the 4Megabyte RAM limit through the use of SIMM modules.

This means an end to the kludges necessary to upgrade the amount of memory in an ST... no more "double-sided sticky tape", no more "piggybacking" chips or DIP headers. Assuming Atari goes with industry standard SIMM modules this means that expanding memory will be as easy as opening the case and plugging in a relatively inexpensive little module.

I haven't gotten too excited over the sound or graphics of the STE, but this easy expandablility of memory is a good enough reason for me to consider buying an STE.

Good job, Atari..!

BobR

3283. What/Where is the latest version of Uniterm?

Hi there,

1) A while ago i posted a question to the net about sampler software,
and someone dit send me some mail. But, i lost your file so
please mail me your adress again. (i think it came from sweden)

2) I would like to place some of my own programs in a cartrige, i know
how to place the headers in front of the cartrige but still
something goes wrong. I believe someone made a program to
convert 'normal' gem based programs to 'cartridge' programs.
So would someone please be so kind to send the program or
tell me where i can get it. I own a DELA Epromburner with
vveerryy old software and would realy start using the machine.

3288. GEM help needed over here, too

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 13:04:07 UTC
From: chrisl@fulcrum.bt.co.uk
Message-ID: <1989Nov27.130407.25447@masalla.fulcrum.bt.co.uk>
Source record: 246560

I have several queries regarding the ST and GEM. My major question is:

How the heck do I get text into my GEM application windows??

I've managed to hack an example application so that it will make several windows and allow them to be moved around using the mouse, resized, fulled, and closed. My next major requirement is to get text into the windows. How do I do it? How do I change fonts? Please help -- it's getting urgent.

I'd also like to know more about operating the serial port. I tried to use the stdio functions (I'm using MWC 3.?), like fopen(), but I kept getting errors like `fundamental error' and `no error'. Eventually I resorted to using bios calls, but the program I've got still loses characters (presumably because it's not running fast enough). Can I get at the port without going through bios? Is there any way of installing an interrupt service routine and persuading the serial device to interrupt when there's a character or when it's ready to transmit? That way, I wouldn't have to poll it.

Thanks in advance...

-Chrisl.

Thanks for all the info, Abacus books bite the dust again. I'll get a
HD 3.5 floppy drive and let the net know how my '85 520 likes it.
Could you please post how - where to get your HD formatter, I'm sure
others would also like to know. This is, after all, a real drive
upgrade and not that hard to do (wish Atari had thought of it, it's
also cheap - right up their alley). I will be checking to make sure
that 1772s can generally handle the 16 Mhz clock. Any more comments
anyone? Sure hope that different formats are noticed automatically, as I
think they are.
thanks,
Bob Pegram (pegram@griffin.uvm-gen.uvm.edu)

I have not tried this, so it may not work:
You could try zeroing the STs magic numbers and doing a soft reset. The
actual names of the system variables to zero escape me at present but
are probably something like 'memvalid' or 'stmagic' (They are set to PI
and e I think).

3295. Floppy Drive Problems?

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 15:47:58 UTC
From: Mark@sersun2.essex.ac.uk
Message-ID: <2575@servax0.essex.ac.uk>
Source record: 246567

Greetings Programs,

I was wondering if any of you kind folk could help with a problem that I appear to have on my ST (I think it's an '87, rev. D 520). It's had a memory upgrade to 1 Meg. and the original 360k drive has been replaced with an NEC 720k device. The second drive is a 5.25" 40/80 track Power Computing device.

The problem is this, if I boot from my usual boot disk, which brings up my usual GEM environment, the system refuses to see drive B. It will format drive B, and you can open it, but all you see is `0 bytes in 0 items' irrespective of what's on the drive. Also if you try and copy a file from A to B a dialogue box pops up with, `This application cannot find the file or folder you just tried to access.'

Booting with a different disk appears to cure the problem, but, if I run Quikdex, drive B is only operating at 49% of what it should, normally I would expect to see 97%. (Drive A is behaving perfectly during all this BTW.) The other devation is the DMA test, which says B is operating at 197%, against the norm of 98%.

What's going on? Which bit of the system is cracking up? Do I send away the floppy or is the controller getting flaky?

Any help would be appreciated, thanks.

Mark Foster.

> MIDI in its Mac emulation. Is this true? Can sources close to Small
> confirm this?

Dave is considering supporting MIDI. But then he is considering lots of different things. There is also a 3rd party who is writing some MIDI software that works on either the Spectre or a real Mac. (Don't remember his name, he talked to Dave about some problems on Compuserve about a month ago).

Getting most Mac MIDI software to work may be impossible since most of the programs go directly to the Mac hardware timers for interval control. The STs hardware timers work differently and are at different addresses than the Mac programs expect.

I wouldn't hold my breath waiting for the Spectre to support MIDI. If (a really big if) it does happen it won't be anytime soon.

3301. "kneecapping" and TOS piracy

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 17:22:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8911280802.AA18983@ucbvax.Berkeley.EDU>
Source record: 246573

Subject: "Kneecapping" by developers and TOS piracy

1. Kneecapping.

The conversation over a shareware alternative to the Spectre GCR seems to point up a tendency among some strains of Atari developers to pipe up and say "I can do what ..... only I can do it better". The result is that the software consumer is faced with a plethora of products and no information on which to make a valid judgement as to which is better.

In short, it often seems that developers are trying to shoot one another in the kneecaps while the users shakes his head and wanders off, disgusted. This appraoch may also reflect a lack of creativity in some corners of the hacker world.

It would be far better if users and developers could work together to iron out bugs and to improve existing products. If developers could find it in their hearts to make commitments to improve their products and if users would take a much more disciplined approach to documenting problems we might see growth rather than stagnation in the Atari software base.

For those who wonder what I mean, let me suggest the following as projects worthy of development:

Improvement or an alternative to the DMC LaserBrain to make it a truly viable Epson emulator for the SLM804. Most Epson users do not want to fret about fonts and the like. Just make it put the same amount of data on a page as the Epson does and make it understand all of the Epson escape sequences. Most Atari applications that output to the printer without fancy drivers (and there a lot of them) couch their ouptut in Epson terms.

Ditto for an HP LaserJet emulator. Make several, each corresponding to the various plug-in font cartridges. Just make it work like and HP.

How about an HPGL emulator for the SLM804? This would let us make proofs of drafting program output without having to have a pen plotter.

How about a CLI that looks like VAX/VMS DCL? U**X missionaires might be appalled, but some folks might enjoy speaking plainly to their machines.

How about devlopers' toolkit like Prototyper for the Mac? Let's make it so that anyone who can understand their problem can write a graphic interface for the program to solve it.

How about a nice presentation graphics program like Cricket Graph or Igor from the Mac World? Many of us need to make publication quality graphs and charts. Degas is not good enough.

I would like to hear about some genuine new products rather than vacuum ware (vaporware without any substance at all).

2. TOS 1.4 Piracy

There is a persistent rumor arounmd here that Atari Germany basically countenanced the widespread priracy of TOS 1.4 ROMs. This rumor came to me from a well placed source within Atari Corp. An equally well-placed Atarian (since retired), who was sitting at the same table, expressed the opinion that this was actually a good idea, because it would result in this greatly improved technology being disseminated much more rapidly.

Why Not, I ask? If people want to burn their own ROMS, why not let them? Atari should even provide diagnostic files that can be run to test the validity of user-generated ROMS. That way every serious user will soon be on the same footing and developers will no longer ve to fret about maintaining compatability with old releases.

Disclaimer: The opinions expressed above are personal opinions held by the author of this piece and in no way reflect positions taken by his employer.

This illustrates how to emulate the white button (warmstart) or
power-switch on an Atari. It *should* be compatible with the new roms.
Normally, you would add the guts to an existing program.

3305. Shareware MAC

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 18:44:32 UTC
From: harryk@bucsb.UUCP
Message-ID: <100@bucsb.UUCP>
Source record: 246577

Guys, I'm really surprised from the way a lot of people faced the possibility of a Shareware MAC emulation for the ST! I think the idea is great, and I don't see any reason for discouraging it! We live in a FREE(?) country, don't we? Any one is free to write any program he wants and distribute it in any way he likes I don't understand the logic of "a shareware mac would hurt David Small and thus the ST community". Small has done a GREAT job with the GCR, but it doesn't give him the right to have the monopoly of the MAC emulators on the ST
The german guys who wrote this shareware MAC, have every right to support the ir efforts. They 've probably spent as many hours as D.Small has, in order to finish their emulator;why should David be the king of Mac emulators for the ST? If this is the way things should be, then every Software House would make an application knowing that noone else will write something similar..and thus there is no reason for them to upgrade their product as often as they should! Competition forces authors to do their best. Take Lotus 1 2 3, as an example: it was the #1 bussines package, until Excel came out! Almost everyone accep- ted that Excel was better than Lotus...and some months later Lotus 1 2 3 announced the latest version of the progarm which is AWSOME!
You see guys, that's the way it goes! The Sharware MAC will HELP the ST world because it will force D.Small to create something even more advanced than GCR.

There is something more! Some people (like me) don't want to purchase the GCR just because they don't need it desperately, and they don't have $400 to spend! If I wanted a MAC, I would have bought one in the first place!I'm oversatisfied from my MEGA2. I 'm not saying that I don't like MAC emulators (i love 'em) but I don't want to spend $400 to get one! A shareware MAC would give me the chance to use a MAC for as much money I think it is worth it!

(The reasons for which I'd like to use a MAC are:
1. to play some PD games (i have a monochrome monitor, you know) during the breaks from my programming projects.

2. to get familiar with the MAC enviroment

3. if i find it useful,I may consider to port some of my programs to the MAC

IMHO it is not worth $400 just for these 3 things)

So, YES I will support the ALADIN, for the reasons I stated above, because I've seen an earlier ALADIN version running, and because Germans have proved they lo ve the ST and their software is almost perfect (Tempus, Modula-2,LABEL-EXPRESS)

****
to avoid any misunderstanding, I must state that:

1. I'm not German....I'm Greek

2. I have nothing to do with the ALADIN authors (and of course I don't take $ from them)

3. (to D.Small)
I think you understand what I tried to say! I have nothing against you; on the contrary, I think you are a real pro and I respect and admire you! GCR is awsome, and reading some of your published interviews, i say you are a PLUS for the ST community! I hope you agree it's awful that some people use your name to prevent others from getting recognition for their work!!!

****

I thank you all
for the time you spent

Date: 1989-11-27 19:01:56 UTC
From: kbad@atari.UUCP
Message-ID: <1819@atari.UUCP>
Source record: 246578

pa1329@sdcc13.ucsd.edu (pa1329) writes:

| Hmmm,. I wonder why is the Atari blitter so ineffective.

"Ineffective" is a pretty strong word. As has been mentioned, software speeder-uppers like TurboST and QuickST give a dramatic speed improvement because they solve the real bottleneck: software overhead.

The BLiTTER chip does what it was designed to do very well. That is, BitBlt operations are sped up tremendously. A large part of the graphics processing being done by many ST's is TEXT bit block transfer operations. As has been demonstrated by Wayne Buckholt and Darek Mihocka, it is possible, given room, to speed these up significantly. Fast, resolution specific blit dispatching and code combined with the BLiTTER chip is phenomenal.

As an aside, I should point out that our VDI guy has put a lot of work into the blit code for the TT, and it's pretty phenomenal _without_ hardware assist. One other thing that will give a noticeable improvement is the lack of Line F compression in STE and TT ROMs. The Line F compression adds a bit of overhead to AES operations, and desktop/window/dialog operations are noticeably sped up when the compression is gone.

| Its speed is no where comparable to the Amiga's blitter.

As I said above, I think the real problem is a software bottleneck. If it were possible to put the Ami blitter in ST's, you'd probably get similar results - albeit with a chip more powerful in terms of variety of operations.

Minix has a few "design flaws" which limit it performance, notice I did
not say limit it CAPABILITY, only its PERFORMANCE. I've been hacking on
Minix for a while now working on improvements in this area. As with most
*NIXes, it doesn't protect you from yourself, thus you can slip-up and
trash lots of data if you do something you don't understand, or even if
you do something that should be reasonable but hasn't been tried by the
authors, if there's a bug hiding. There is a special program which allows
Minix to read/write TOS filesystems, but not vice-versa, and the partitioning
information is compatible. I have 106Mb divided into 5 TOS partitions and
3 Minix partitions. I run both OSes with a simple reboot to switch.

> From being a UNIX administrator, I am use to re-compiling the kernel.
> Is it really as tough as you say it is?

If you're used to recompiling the kernel to make changes, you should be
just fine. Most "end-users" aren't prepared to do this.

> The second reason that I am purchasing MINIX is to learn how to write
> operating systems. People have told me that MINIX is well supported.

I think Minix is a very useful platform for learning about OS internals.
Don't count on it being a shining example of the best way to do everything,
but it does get the job done and there's a lot to be said for "working
code" over "theoretically ideal designs".

> Thanks for the previous comments and any comments that you wish to append
> to this message.
>
> Mark Lehmann

In summary, Minix is _NOT_ currently an end-user OS. It's for people who
want to tinker with the OS, or the supporting tools, and who don't mind
getting their hands dirty to make changes. It is reasonable well supported
in the sense that there are a lot of very active users (and authors) in
the comp.os.minix newsgroup who can be very helpful and there is a steady

flow (or should I say FLOOD) of new hacks you can try from other people.
It is _NOT_ supported in the way most end-user would expect. The publisher
treats is basically like a book, and what kind of "support" is needed for
a book? You get the idea... :-)

walkerb@tramp.Colorado.EDU (Brian Walker) writes:

| What did you do with the line F compression?
It's gone. Because of the larger ROM space in the STE, (and TT), the line F compression is no longer required to make the TOS ROM image fit. With the exception overhead gone, the AES moves along noticeably faster, too.

A few points:

1) In order not to violate Apple's copyrights, ROMS must be made available for this guy by way of a cartridge. That is going to be expensive, so the likely result is the shareware fee will be paid even less often than usual.

2) In fairness to David Small and as an obvious business move, don't make the cartridge steal his thunder. (His software has checks to make sure the ROMS are in one of his cartridges and aren't EPROMS. Making a cartridge to get around this like the Discovery cartridge tries to results only in OUTRIGHT PIRACY of his software for use with the alternate cartridge. Also, if the cartridge is compatible, VIRTUALLY NO ONE WILL EVER USE THE SHAREWARE SOFTWARE OR PAY THE FEE: they'll just use his software and hurt his business AND yours.)

3) Comparing David Small to Lotus is laughably self-serving, the kind of defense that pirates sometimes make: "No one gets hurt, only some big business..." David Small is a small businessman trying to make a living while producing outstanding technical achievements on a machine that much of the world can easily afford to ignore. The market for STs in general is too small to take the existence of such guys for granted: if they get burned enough, they'll just go work somewhere else. We cannot afford that. Dave Small sells STs with his work, and that helps keep my machine viable.

Disclaimer: These views are mine, not necessarily my organization's.

A "crippleware" program called STALKER was distributed on this network many months ago; it may be available at the archive sites. The demo version was limited to uploading (from you to a remote computer). To get downloading capabilities, you had to send money to the programmer.

It looked pretty good. However, the background operation was based on GEM pseudomultitasking. This means that any non-AES operations will bring the background task to a screeching halt. For example, I could upload to a BBS quiet easily while running GEM First Word, but as soon as I fired up MicroEMACS, a compiler, or even a command shell, the system halted because the foreground task had issued a blocking GEMdos system call (typically Bconin or Cconin). Well-written GEM programs are supposed to do most of their work by calling the Event Manager, which allows the background process to have a crack at the system as needed, but most of the software I use is non-GEM.

STALKER is a desk accessory, with all the limitations that accrue thereto. As I recall, the size of the file to be transferred was limited by a static buffer. The reason for this is that a GEM DA doesn't own any file handles; they belong to the foreground task, as far as the operating system knows. When a foreground task terminates, all files are closed and handles are released. This is death to the DA if it is writing periodically to an open file. Most DAs deal with the problem by doing only a single disk write.

I think the more appropriate solution would be to maintain an internal record of the file pointer, and to Fopen/Fseek/Fwrite/Ftell/Fclose each time the DA's own data buffer gets full. (This does leave the door open to a horrible mess if the user or another program touches the file or even changes a disk, but that's life.)

I think Eidersoft has marketed a commercial background file-transfer utility, but I have not seen it advertised in a long time.

I would like to see someone write a generic background file-transfer utility with a well-documented interface that could receive instructions from other programs using the GEM AES message-passing facility. Any volunteers? I'd love to do it myself, but I'm sort of tied up with some other stuff at the moment.

Of course, if Dave Beckemeyer releases RTX as he has hinted, the whole issue could become moot -- a program could spin off a real background file transfer process and not have to worry about living under the Event Manager's thumb.

3311. Mega chips & drive questions

Newsgroup: comp.sys.atari.st
Date: 1989-11-27 20:50:42 UTC
From: mjv@iris.brown.edu
Message-ID: <21653@brunix.UUCP>
Source record: 246583

I have several questions about chips in my Mega2.

I've been thinking about upgrading to TOS 1.4 and have read the messages about the weak power chips. I looked in my Mega2 and here are the chip numbers in order of 1-4 going from top to bottom on the board:

Rev. 5.0 Mega2 (made in/just before April 89)
1 - GD74LS244
2 - T74LS373B1
3 - GB74LS244
4 - T74LS373B1

My Mega is running on a two rom set. I'm wondering if I should have these replaced when I get rainbow TOS. The LS373's have a chip name of _ST_ . David Small mentions in the GCR manual that ones made by SCS are definitely bad, so are these LS chips also bad?

My current chips power the GCR just fine and even for extended periods of time too.
Should I try to wait for the two ROM set which Ken B. said has been made or get the 6 rom set now?

I also noticed that there was a very tiny board on top of the 68000 with a _SCST74LS74B1_ in it and a wire running to an unlabeled spot on the board just above and to the left of the 68000. Anyone know what its for? It seems like it was a rather last minute change and the glue job was very sloppy.

And a note to anyone who maybe interested; there are tracings on my board to the unused memory slots so it appears that I can upgrade to 4 meg. I compared my motherboard to the picture of the early Mega4 in STart a while back and they looked the same (except for the board on the 68000). I was not able to look at the MMU chip to check its ending letters (to see if it was one of the 2meg only kind) because I wasn't confindent about getting the bindings off. I'm not much of a hardware guy :-)

Has anyone else had problems getting the internal drive on Megas to work with the GCR? What exactly did you do to fix it. I just would like a better description of proceedures that D. Small gave in the read me file. I sure am glad I have external SF314 to read those Mac disks, loud as it may be.

Thanks in advance!

>1 Mb of memory in the 1040 STE, as I said it's is a slightly modified
>1040 ST.
>The same monitors as before. And as far as I can tell there's no change
>in resolution either [...]

The changes in video are as follows:

The color palette has 4096 colors, not the ST's 512. That's
four bits each for red, green, and blue. You still get the same number
onscreen at a time (4 or 16) but the shades can be finer, and you
can get 16 true grey levels.

The video address can be changed on a line-by-line basis.
This makes split-screen stuff really easy.

The video memory buffer can be larger than the screen.
The screen then becomes a "window" onto this larger canvas.

The video can start on any word boundary.

Each line can be delayed by any number of bits.

What this all adds up to is horizontal and vertical scrolling by bits,
and split-screen effects which are effortless and not memory- or
time-consuming. You can, for instance, load a large "landscape" into
memory, like a whole Gauntlet level, and slide the "window" around by
individual pixels, taking ZERO TIME rather than the huge time required
to move the memory around. In addition, you can have the static
(non-scrolling) part like the scores at the top or bottom: it won't
have to be moved around, copied, or anything.

>How long have Atari kept the UK waiting for this now?

You mistakenly imply that Atari Corporation (the parent of all subsidiaries) has "kept the UK waiting." This is not the case. The UK has TOS 1.4. If they don't want to manufacture or ship it, that's their call. We don't tell them how to run their operations.

(I don't really know that much about the subs: for example, I think they order ROMs from Atari Taiwan. The point is that Atari Corporation has provided all subs with TOS 1.4, and from that point on it's up to the sub.)

I wouldn't worry too much about a shareware Mac emulator hurting Gadgets By Small much. First, the German (formerly Aladin) only used the 64K ROMs, so many newer mac programs won't run. Second, Dave Small has provided outstanding support for his products.

If the shareware mac emulator were to compete with Spectre 128/GCR (tm) of Gadgets By Small, it will lose. As long as Dave Small and Company continue supporting Spectre/GCR.

So, go for it. The folks who buy the Shareware mac Emulator probably wouldn't have bought the GCR anyway.

But why buy the shareware?? GCR is NEW and WORKS and can read/write REAL mac floppies. So, why not buy it??

Figure, once you buy the hardware (which you only do once) you start buying software. And you will spend many hundreds of $$ on Mac SW. So, why skimp on the cost of the emulator?? The GCR is a bargain at twice its price!!

Another postive note:

My local Atari dealer is a fine gentleman named Henry Ahle who owns
and operates a store called Computer Works in Glendale AZ. Business
is going so good for him that Henry told me today that he is planning to
open a SECOND store in the Phoenix-Sun Valley area. That is VERY good news.
And it is attributed to Henry's support, after the sale, of his customers.
I have referred many friends to Henry simply because I KNOW that if their
machine EVER fails Henry can fix it.

My sister back in Illinois has a 1040ST which was struck by an AC power
surge during a thunderstorm. She shipped the 1040ST to me, and Henry had
it fixed in less than a week. It turned out that the switching power supply
died (but it protected the AC line fuse quite nicelt thanks :-)). But, the
thing is that Henry fixed it for less than it would have cost to send the
1040ST back to Atari for replacement.

So, a GOOD local dealer, like mine in Phoenix can make all the difference!!

Another postive note:

My local ST dealer, Henry Ahle, just talked to me about his trip to Comdex. Henry was VERY happy with what he saw at Comdex. Henry saw the TT/p with the Atari 14" color monitor and the 19" monochrome monitor. Henry said that the color monitor was very crisp and legible, even for text. Henry was not pleased with the TT/p's cabinet, but was very happy with its operation. All in all, Henry thought that Comdex was good.

But for the Not So Positive Note:

Henry said that the STacy has passed FCC testing and should be shipping soon.

The 1040STe is next to be tested by the FCC. It probably won't ship until 1st Quarter 1990.

And the TT/p is the last to be FCC tested. Henry doesn't expect to see a TT/p until 2nd Quarter 1990.

Now, realize, these delivery dates are estimates given to a MAJOR ST dealer. so, they should be reliable.

Does ANYONE from Atari want to confirm these dates?? :-)

So, I guess you should be able to buy a STacy soon, but a TT/p will have to wait until next Summer. Sigh...

>

Practical solutions in Tucson AZ has a new ST mouse which is cordless,
hence the name Hampster. Anyway, that's what I call it. It has a small
box which attaches to your ST and you point the Hampster towards it. I haven't
bought one, but a friend of mine has.

My friend loves his Hampster. It has more resolution than the ST mouse, so
you have to move it less. And it doesn't have a cable getting in your way.

I don't have a price for it yet, but you should see ads for the Hampster soon.
It has a builtin microprocessor, so don't expect the Hampster to be cheap. I think
that it retails for $150, but I may be wrong.

Anyway, look for the cordless mouse from Practical solutions. It looks good.

The Atari ST's use a switching power supply. Such power supplies
contain toroidal (donut-shaped) transformers wound on ceramic cores.
Sometimes the windings are loose enough that the high-frequency
switched magnetic fields causes them to vibrate on the cores,
producing the sounds you hear. You or your dealer could apply a
material called "corona dope" (usually used on television flyback
transformers) onto the toroids to stop the vibration.

This is a very common phenomenon with switching supplies.

I have a 18 month old Atari SLM804 laser printer which I
am considering replacing. I have seen the HP LJIIp on sale
for $995.00. Well, it comes with only 1/2 meg of RAM and no
extra fonts or Epson emulator cartrs at that price.

Does anyone know if PageStream or Calamus or EasyDraw/TouchUp will
work with the LJIIp??

Does anyone know if the Spectre/GCR will print graphics at 300 dpi
on the LJ IIp??

Does anyone know if any of the IBM PC addons will print at 300 dpi
on the LJIIp??

do I need to add more memory to the LJIIp??

Do I need to buy more font cartridges for the LJIIp??

Do I need to buy the Epson emulator cartridge for the LJIIp??

Does Migraph have a good GDOS printer driver for the LJIIp??

does *ANYONE* have a good GDOS printer driver for the LJIIp??

How slow is the LJIIp compared to the SLM804??

How much does the toner cartridge cost for the LJIIp??

Does anyone use the HP LJIIp on thier ST??

Thanks everyone.

| can you tell us with any great certainty if you will accept a trade from the
| 6 eprom set to the 2 rom set with no additional cost?????
I can't tell you with any certainty, but I can certainly offer my opinion.
It is my opinion that Atari will NOT accept trades. Why did you buy the
6 chip set in the first place if you don't feel you can use them?

| if we here at electrohome don't have to butcher our motherboard [...]
The modification to install 6 ROM chips in a machine currently using 2 ROMs
is in no way a butcher job. It is a simple, clean modification, which was
part of the original design of the machines when they went from 6 chips to 2.
It does, however, require some electronics and soldering experience.

| the 6 eproms make the atari feel like its a cheap clone of the real thing.
I can't believe what I'm reading here. EPROMs were made available due to
popular demand. Very few sets of EPROMs were sold: around 150, I'm told.
As soon as OTP's were available, _they_ were sold instead, and likewise
with masked ROMs.

If the "cheap clone" statement was intended to be a joke, it's a bad
joke. In case you can't tell, this is an extremely sensitive issue with
me personally, because I personally worked very hard to make the
Rainbow TOS ROMs available to developers and to the general public.
I am truly appreciative of all the Emails of thanks that I've gotten.
I also truly take complaints very seriously.

cs161fca@sdcc10.ucsd.edu ( ) writes:

| In some back issue of ST Report it was mentioned that the TT and
| the STE use the same graphic chip.

That is wrong. The TT shifter is different from the STE shifter. The TT shifter gives you the new TT resolutions (640x480 16 color, 320x480 256 color, and 1280x960 monochrome), with the enhanced palette of 4096 colors in color resolutions. The STE shifter has the enhanced palette, but not the new resolutions. The STE shiftger also allows fine screen scrolling by allowing arbitrary (wordwise) screen alignment. The TT shifter requires 8 byte alignment of screens. The two shifters are compatible in that they are located at the same place in memory. That's what gives us ST video compatibility on the TT. But it is not possible to use the STE shifter to get TT video modes.

| the new chips in the STe.

Atari Corp. policy is that we offer developer support to registered developers, not to end users. I know how you feel about the issue, and I'm sorry if you feel "left out." It seems to me, though, that it just wouldn't be cost effective for us to offer the level of technical support we give to developers to end users.

Incidentally, developers who ask can get STE release notes from Atari. I believe it is a requirement to be "re-registered" under our new nondisclosure policy. This new registration is free of charge for registered developers and will allow us to provide better support to developers actively working on ST products. This is part of the improved developer support program which was announced at COMDEX. US developers can find out more by contacting Gail Johnson at Atari.

I NEVER said that nobody would get hurt. In fact, I'm sure that this would
take some business away from GBS. However, I do not believe that David Small
deserves a monopoly on Mac emulators? What happened to free competition?
I used "Lotus" as an example. I could have said Antic. Should nobody else
write a terminal program just because they wrote Flash?? I feel that if
someone else wants to put together a "Shareware Mac", (and of course that
they don't try to steal from David's work) more power to them! I don't think
that David's work should be monopolistic, just as I feel that Avante Garde's
PC-DITTO shouldn't have 100% control over the market for PC emulators.

-Jeff

P.S. No, I'm not a customer of GBS. It's too pricey for me. I do own
PC-Ditto. It sits on the shelf and keeps the dust off of my desk.

><insert generic type of program here> because it might hurt
><insert generic software house/publisher/author>'s business?

[Analogy substituting Lotus for Spectre deleted]

>Jeff Beadles jeff@quark.WV.TEK.COM

There are two significant differences here. Lotus is sold for a premium price
so a shareware version could be expected to be successful and therefore
desirable and probably would be supported. Spectre is reasonably priced and
therefore a shareware version is not going to be particularly competitive
and therefore should be expected to be poorly maintained. Thus substituting
a poor piece of work for a good piece of work.

Lotus is sold high volume at high returns. It would not be expected that
a reduction in its sales would destroy the company. Spectre is sold low
volume with small margin, a reduction by 1/3 would probably be fatal to
Gadgets by Small.

3330. SOUND CDED RUNNING ON SPECTRE

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 01:42:55 UTC
From: MAXG@SUVM.BITNET
Message-ID: <8911280804.AA19421@ucbvax.Berkeley.EDU>
Source record: 246502

Well I've finally taken the plunge and started playing with sound on Spectre1.9. I'm using system 6.0.2, since this is what an informed source recommended I use on my MacSE. The problem I am having is as follows: When I get the control panel from the apple menu, I do not see the sound cdev in the left hand window (for that matter, I don't see the start-up device icon, either). I have the correct versions of the control panel and the sound cdev (because they are the same ones I'm using on my SE, and I have access to them on that machine's control panel). Does anyone have any ideas? I don't think this has anything to do with sound on the Spectre, because I haven't even gotten to hearing the actual sound yet...or--is it the case that Spectre doesn't actually support Apple's Sound cdev, and I need to get another?
Well, as usual...thanks in advance for any replies...post here or email directly to me at: maxg@suvm (bitnet) or ggreenbe@rodan.acs.syr.edu (internet).

3331. 2600 track=mouse Mod

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 02:23:24 UTC
From: BGB100@PSUVM.BITNET
Message-ID: <89331.212324BGB100@PSUVM.BITNET>
Source record: 246503

Several people have asked me to post the description of the modifications to
and Atari 2600 trackball to have it work as both a joystick and a mouse for
the ST. Below is the semi-detailed plans I wrote up to perform this mod.
Let me know if any corrections are necessary. Thanks.

Atari 2600 Trackball -----> Atari ST mouse

Here are the mods necessary to convert an Atari 2600 Trackball for use
as a mouse for the ST. Notice that this mod will allow the trackball
to also function as a joystick depending on how the switch on the bottom
of the trackball is set (T=mouse, J=joystick). The only major drawback
of this mod is that the trackball has only one button...the left mouse
button. (but, hey, how many programs use the right mouse button?)

OK, here goes...
1. Figure out how to open the trackball.
There are a few (4?) screws on the bottom of the trackball. Once
the screws are out, you should be able to pry the top half off.
2. Take out the ball (looks like a billard ball!).
Look on the board for a chip marked 4019. If this chip is socketed,
you're lucky (the mod is much easier). If it is not, well...
In any case, this chip has to be removed. DON'T destroy it! It
is still needed. Normal CMOS precautions apply. Static can KILL!
--At this point, you should have the 4019 out of the circuit. If it
was not already in a socket, I would suggest putting a socket in.
3. Find the pins 1, 3, 5 and 7 on the 4019 chip. Use the diagram
below if you are not sure. Bend these pins up so that they point
either up or out to the side. These are the pins that will be used
for the 4 wires in this mod. They will not have to be reinserted
into the socket where the chip belongs.

```
__________
---> -|1 U 14|-
Bend these -|2 13|-
pins out ---> -|3 4 12|-
-|4 0 11|-
---> -|5 1 10|-
-|6 9 9|-
---> -|7 8|-
-------------
```

4. To make things easier to solder, reinsert the 4019 into the socket.
5. Now, 4 wires must be soldered into the circuit. Use the table
below to know which wires go where. All connections to the circuit
are either to the 4019 or to Test Points (TP) on the circuit board.

Pin # on 4019	Connection point
1	TP1
3	TP2
5	TP4
7	TP3

6. Recheck all the solder joints to make sure no solder bridges exist. Reinstall the billard ball onto the rollers.
7. Close up the trackball. Set the selector switch on the bottom of the trackball to T (trackball=mouse). Plug it into the ST and Boot up the computer. Try it out. All should be OK. If the pointer movement is not correct, then a connection was not properly installed. Pull everything apart and recheck.

You should now have a functioning track-mouse (or whatever you want to call it). I derived these plans from some I saw on the net for making the Atari trackball work on the Commodore Amiga. I have also seen plans for making the trackball work on the ST, but the joystick functioning was messed up.

If you have any problems/questions don't hesitate to send me a note at:
BGB100@PSUVM.BITNET
No guarantees on a quick reply (final exams and holiday break coming up in a few weeks). Also, I must include the standard disclaimer. I have built one of these and will be making another for a friend soon. I have experience in working with Atari computers and electronics. If you are not sure of yourself, ask someone you know for help. I don't mean to discourage anyone from trying, but I cannot take responsibility for anyone else's mistakes. If I have made an error in these plans, I appologise. If you find a critical mistake, please let me know.

With all of that said, Good luck and happy trackballing!

Bruce Blanar

3332. Commodore Amiga mouse->ST

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 02:33:25 UTC
From: BGB100@PSUVM.BITNET
Message-ID: <89331.213325BGB100@PSUVM.BITNET>
Source record: 246504

Below is a decription of the mod need to be made to a Commodore Amiga mouse
to get the mouse to work on an Atari ST. The Amiga mouse offers a faster
(slightly) tracking rate and two very comfortable buttons to use. The
mod is easy to do and provides a very nice mouse. Enjoy!

Commodore Amiga mouse -------> Atari ST mouse

This is the mod for a Commodore Amiga mouse conversion to ST mouse. No
big deal about the difficulty of the conversion, but still be careful
about what you do. I have included the original wire order by color so
that if you do mess something up, it is here. If the wires in your
mouse are different colors, I suggest writing down the color order before
starting in case you switch the wrong wires. Then you can go back to
START and begin again.

OK...here it is. All it involves is switching two wires on the connector
going to the mouse circuit board. I'll give the before and after views e
of the connector wires in order from back to front (of the mouse).

```
Before To use on an Atari ST
--------- ------------------------
Black Black
Blue Blue That's it!
Brown -----\ /-------- Yellow
Orange \/ Orange
White /\ White
Yellow -----/ \-------- Brown
Red Red
Grey Grey
```

Like I said, the mod is not difficult. The standard disclaimer applies.
I cannot take responsibility for any misfortunes that may befall you
because of your using these plans for the mod. I have performed this
mod and I know it works. I ripped the whole mouse apart trying to figure
it out before I found out I just had to switch two wires. If you need
help with the mod, ask someone you know who has the expertise to do it.

Good luck!

Bruce Blanar

3334. C++ on ST?

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 08:20:47 UTC
From: dhp@stl.stc.co.uk
Message-ID: <2455@stl.stc.co.uk>
Source record: 246506

Are we ever likely to see a commercial C++ compiler on the ST?

Having got fed up with seeing yet another C compiler being released (there must be 10 or so now) I contacted the UK distributor of Lattice C. Apparently Lattice have a C++ *translator* for the Amiga but do not intend to release it on the ST until they see how well version 5 of their C compiler sells (in UK, Europe, USA ?).

g++ I hear you say - too big and no support I reply.

Rather than flood the net with mutual complaint messages I suggest any of us who do want to see a commercial C++ compiler on the ST contact the appropriate distributors and compiler developers and lobby them.

Alternatively, are there any C/C++ developers listening who are adventurous enough to release the *first* accessible Object-Oriented language for the ST? (NB Little Smalltalk is not suitable for large scale development and the Dortmund Smalltalk-80 is too expensive (about 600 sterling) and needs 4Mb)

Apologies for posting this item as a followup, I haven't figured out how to post direct yet and 'g mod.announce.newusers'did not work!.

Amazing! Landon Dyer said that Madmac could do this but never said how.
Thanks Mike.

What annoys me is that I have a manual for Madmac version 0.11 (Alpha) and an executable version 1.00 (Oct 1987). I hope this works.
With the advent of Rainbow TOS there has been a new release of Madmac and ALN but (fingers in ears folks :-)
ATARI UK ARE GIVING OUT NEITHER THE ROMS OR UTILS TO DEVELOPERS AND I AM ROYALLY PISSED OFF ABOUT IT!!!!

To Ken Badertscher (Atari US):
I thanked you earlier this year for downloading my net article and forwarding it to the appropriate Atari Corporation executives. Sadly there has been no action yet despite 4 letters to Bob Katz (Atari UK), the last of which was registered. If you can get me any help I would be eternal2ly grateful.

Generally again:
The deliberate suppression of Rainbow TOS in the UK is punishing the ST here. TOS 1.4 took a long time to finish but I believe that wait is worth it but when it is released right across the world but not in the UK that is more than I can take. Many others feel like I do that this is causing a lot of people to quit the ST. Such is the frustration that someone once suggested that UK ST owners should get US images and convert them (screen freq, keymaps , whatever it takes etc).

I believe we paid 500 pounds for the Developers kit back in 1986 and since then we have got only Madmac, ALN and 2 newsletters the last of which was in November 1987. The list of things we want developer info about gets longer by the day. When will Atari UK support us? Perhaps if they were led to believe that we were developing the all singing all dancing program that would help sell 200,000 ST's a year we would get support.

Currently our only source of info seems to be Atari US employees, most notably Allen and Ken, who use the net.

>---Gerry

Spectre (as of 2.3) does not support the new Sound Manager routines Apple added in System Tools 6.0.2 and above. Yell at Dave Small. :-) The Sound Master CDEV works, however, since it doesn't use the new Sound Manager.

The Sound CDEV (and the World CDEV, too) will not show up unless the system has extended parameter RAM. It stores the settings in there. The Spectre has neither extended nor standard "battery backed-up" parameter RAM. Only the Mac Plus and up has extended PRAM. A hack, "Disk Param", will simulate the normal PRAM by saving it as a disk file. The extended PRAM can be simulated with another hack, XPRAM, which was originally written for 512KE owners. Eventually, some nice Mac programmer will write one slick INIT just for Spectre owners (or Mac owners with dead PRAM). :-)

Also, if you press ALTERNATE and the "+" key on the numeric keypad, the system will think you are a Macintosh Plus (which, it assumes, must have extended PRAM). NOTE: For some reason, it doesn't completely think you are a Plus if you are running System Tools 6.0.4. It normally thinks you are a 512KE.

I've already seen advertisements for not only TOS1.4 epromed, but bug fixed as well for $65.00. If I decide to upgrade, you can be sure that I'd trust a pirated EPROM bugfixed version from some guy who I know KNOWS how to program than a corporation selling me another version with bugs for 60% more money! I'd offer up the address, but some law abiding reader would probably turn him in.

Help!!
I presently use a commercial product called 'Partner ST'. It is quite good as a multi accessory but it occupies a lot of space. Fine on my mega 4 at work but a real pain on my 1040 at home, and as for my even lower paid side kick who can only afford a 520, well..... The only part of the accesory that I use constantly is the Reverse Polish Notation calculator (like an HP calc). Query? Does anyone know of a good PD desk accessory RPN calculator? An address would be good a UUcode even better. Thanks in advance.

Dennis Summerbell.

The thing with a Mac emulator is that no matter what, you have to spend $140 on
the ROMs. So what does it matter if you spend $20 for a shareware one or a bit
more for a commercial one? The shareware one probably wouldn't "sell" anyway.
It just seems silly for a lot of different people to invest a lot of time
making a Mac emulator when the product already has several incarnations on the
market. The time would be better spent making a Commodore 64 emulator, for
example. (And some way to pipeline the ROMs out of a real 64... enough people
own these anyway such that it wouldn't be illegal or unfeasible for each buyer
to get them legally that way).

> There is something more! Some people (like me) don't want to purchase the GCR
> just because they don't need it desperately, and they don't have $400 to spend!

Again, unless you plan on getting the ROMs illegally a shareware Mac is not
going to cost much less than the commercial one...

> (The reasons for which I'd like to use a MAC are:
> 1. to play some PD games (i have a monochrome monitor, you know) during the

>
> 2. to get familiar with the MAC enviroment
>
> 3. if i find it useful,I may consider to port some of my programs to the MAC
>
> IMHO it is not worth $400 just for these 3 things)

Is it worth $360? (I expect a shareware Mac would cost about $20, and the
commercial software could probably be had for not much more than $60... I am
assuming your $400 comes from a Mac disk drive & 128k ROMs).

>
> HARRY KARAYIANNIS

As a side note... there is on the Amiga now a pirated version of the A-Max Mac emulator which has the ROMs on disk. (I've seen it). I think a shareware version, especially one which supports putting the ROMs on disk directly, would have the immediate side effect of giving everyone in the Atari ST community (which has been heralded for its piracy) a free, highly illegal, Macintosh.

I hope, Pit will not make this mistake; Apple would take legal action in
this case - and win, of course.

>
>I kinda hope that this shareware Mac thing specifically checks for illegal ROMs.
How?
I suspect Pit to read in the ROMs from a standard ROM cartridge (this
simple thing with 2 sockets and a 7400 that plugs to the cartridge port
and offers 128 KBytes of ROM); it would be impossible to tell original
chips from copies in EPROM.
But it would leave responsibility to the user; the author of the
software does not suggest the user to do anything illeagal...

After all the (probably justified) compliments to Small's gadget, let me remark here that I know the makers of Aladin to be capable of producing an excellent emulator. Aladin has been around for years and has been very satisfactory for a number of people around here. If the shareware mac is of the same quality but uses 128k roms, I'd be very interested.

By the way, all those (u.s.) people who would feel that a shareware Mac would be unfair to Dave Small suggest that capitalism is into as much a decline as communism :-)

Anyway... there's lots of great midi software for the ST...
and in general, the ST has surpassed the MAC in this arena in
both performance and choice. While it might be nice to emulate
a MAC midi program, I am almost sure you may find a program in the
ST world that is equal and likely better. I think David realizes this
and is therefore reluctant to spend his efforts in that direction.

I do recognize, however, the prevalence of MACs in the studio
environment, and that it would be nice to simply bring a disk
to a studio if an ST is no where to be found. Two solutions:
1) Buy a STacy.. if they ever go into production.
2) Save your ST midi files in standard midi file format and
copy them onto your Spectre formatted disks.. take them to
the studio and use the studio's mac gear. (I don't know if
this is possible since i haven't yet bought GCR. WHile
I plan to buy GCR, it will be for reasons other than music).

An aside: I found out yesterday that NOTATOR will NOT work
with Jim ALlen's Turbo16 board. Jim told me that C-LAB was at
COMDEX and couldn't get the program to run with the
accelerator board nor on the TT/P. Why? All has to do with
PIRACY.... NOTATOR uses a dongle that hangs off the cartridge
port for copy protection. Jim explained to me that the
timing of the read will only work on a normal ST... but he
assured me that C-LAB should have no problems writing a
quick fix for it. I then called the national rep for C-LAB
and had a long talk with him. We were interuppted by another
phone call... but i did let him know how disappointed i was
with the news. Also, i let him know that it didn't please me
that when i get GCR, i will have to be constantly turning my
machine off, removing the NOTATOR dongle, reinserting

GCR etc.. rebooting.. every time i switch applications.
He agreed that the wear and tear on both the cartridge ports and
the cartridges would likely create problems in time.

MORAL: PIRACY only HURTS us ALL.

Solution: C-LAB produced the "Combiner" which allows
4 cartridges to hang off the cartridge port. Cost: $349.00.
NOT a "solution" I can implement at this time.

> walkerb@tramp.Colorado.EDU (Brian Walker) writes:
> | What did you do with the line F compression?
> It's gone. Because of the larger ROM space in the STE, (and TT), the line F
> compression is no longer required to make the TOS ROM image fit. With the
> exception overhead gone, the AES moves along noticeably faster, too.

Why didn't Atari use large ROMs for the 1040 in the first place? Using
line-F makes upgrading to a 68020 and a floating-point coprocessor really
difficult. Now it also appears that exception overhead seriously affects
AES-speed 8-(!
Were ROMs so expensive at the time that Atari felt they should decrease
ROM-size at any cost, or is this a problem of the MMU, or what?
Will there ever be a chance for 1040 owners to use a larger ROM-set,
thus being able to painlessly use a 68020 running standard TOS? Is it
possible to make a hack and solder the extra ROMs in? Or would you have
to replace the whole motherboard with an STE-board (which has the same
case anyway)?
I'm not complaining, just wondering, so send flames to /dev/null (or the
trash can).

I know this may be an old topic....but I really would like to stop having
to drop my ST before I boot it to work properly :) I know its a looses
chip problem (at least pretty sure it is), but don't know which it is.
Often, to get the 520 ST with 1 meg upgrade (EZram (old version)) to boot
up properly I have to drop the machine from about 3 inches, and most of the tim
e it will then work fine.....can anyone out there please give me some advice
before I end up giving the thing a concussion! :)

Thanks!

3353. For Sale:520ST RGB & Software $475

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 17:37:36 UTC
From: rona@hpdml93.HP.COM
Message-ID: <15480002@hpdml93.HP.COM>
Source record: 246524

I've decided to sell my 2nd Atari system. I already have a
1040 system and bought this one for my wife. Unfortunately,
she hasn't shown a lot of interest.

HARDWARE:

Atari 520ST 1/2 Meg of memory
Atari RGB Color monitor
Atari Single Sided 3.5" floppy drive
For $50 more I'll add:
Star Gemini 10X Printer (sorry, I can't include the
cable as I upgraded my printer
and never bought another)

SOFTWARE:

1st Word (Easy to use Word Processor)
ST Basic
VIP Professional (Lotus 1-2-3 Clone)
DEGAS (Color Drawing Program)
Top Gun (fly around, shoot 'em up game)

2 disks of Ron's favorite PD software
(or YOUR favorites if you know what
you want, I probably have it!)

$475 Takes all. Add $50 if you want the printer.
I will consider any reasonable offer.

3354. Does anyone know where to get VHS-sized labels?

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 17:40:00 UTC
From: rehrauer@apollo.HP.COM
Message-ID: <471c2a69.20b6d@apollo.HP.COM>
Source record: 246525

(Just saw some LabelMaster questions go by, and it reminded me to ask this...)

Well, does anyone know of a source for blank adhesive labels that are of a suitable size for the front and/or side of a VHS video cassette? They needn't be on sheets that have pinfeed edges, though that certainly wouldn't be cause for complaint. I've looked around at various label sources, but none of them carry anything that better than roughly conforms to the dimensions I want...

3356. Re: "kneecapping" and TOS piracy

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 18:11:32 UTC
From: whack@nmsu.edu
Message-ID: <434@opus.NMSU.EDU>
Source record: 246527

In the previous post, it was commented that what was needed
was some commitment by developers to improve their porducts
and for there to be a wider variety of products porduced.
Some products were suggested including SLM drivers, graphics
packages, and so forth.

I would like to comment that some of the need for products like
the Spectre GCR and PC-Speed(and others like them) arises from
the fact that there is software available on those machines which
are in ways better developed that ST software. I congratulate
the developers of the emulators for making that software available
to ST users, but I must ask software developers to fill in the
gaps with ST software.

Personally, I am in need of a professional package to display data
for publication (akin to Mongo on the Sun's). As a result, I am
working to develop software on another machine with some other people
to do this. I would like to extend the invitation to more experienced
ST/GEM programmers to help me produce a ST version. It is this kind
collaboration that is necessary in the ST world. Aren't there enough
terminal emulation programs already!!??

I hope the ST developers group really gets going and takes the initiative
in this area. I would also hope that Atari would support such
development. Let's hear it for some variety and quality.

Ken, I know that you are the wrong person to ask but since you read USENET here goes. I have asked John Townsend on GEnie the same (only yesterday) and I expect him to respond there.

I understand that REGISTERED developers can buy Atari hardware at a discount (I heard 50%). I have been investigating IBM PCs, Amigas, and Macs, and I still feel that GEM/AES/VDI is easier to program on than the systems on the other machines. I own a Mega ST4 (etc) and might be interested in buying a TT/p (even with all of its shortcomings) if I could get it at a Developer's 50% discount.

But, while I am writing some ShareWare programs (mainly to support FoReM ST) I haven't tried to develop COMMERICAL programs. So, would my ShareWare programs qualify me as an Atari Developer?? Or would I have to go to the trouble (and expense) of selling my programs?? I make enough money at my fulltime job that the small amount I would make off of my FoReM utilities wouldn't mean much to me. The programs are only of interest to FoReM system operators.

But, it would be nice to buy a TT/p at the developer's price. In fact, that is the ONLY way I would buy a TT/p. And maybe I coulf think of some commerical applications for it once I get it.

So, what are the requirements for a registered developers?? John Townsend has said on GEnie that RDs need to submit a Business Plan and Products to Atari, or already have sold ST products. That leaves me out, as all I want is to sell some small ShareWare programs.

rehrauer@apollo.HP.COM (Steve Rehrauer) asks:
| are there ROMs which say "1.6" which really contain different things?

Yes there are! The STE_FIX.PRG knows which version needs the fix and
which version doesn't. The program is available in the countries
to which the earlier dated ROM revision was released. All a user needs
to do is run STE_FIX and it will refuse to install itself if the TOS
version doesn't need the fix.

Incidentally, the original 1.6 revision has an os_date in the os header
of 0x07291989, the corrected revision is dated 0x10171989 (that date
ring any bells for anyone? ;)

I agree. I've been to two Atari dealers a number of times (most recently San Jose Computer a couple of hours ago, which is why I'm motivated to write this,) and have always been told that they were out of 1.4 ROMs. If I had a binary image of the thing, I could go put it on EPROMs and have it in my machine tonight, as could a number of Atari-owning friends of mine.

I realize that Atari doesn't want to deal with trying to support hundreds of modified versions of 1.4, which would inevitably arise if the OS were released in this way. There are two solutions to that problem. The first, and easiest, is to put something like

THIS CHIPSET IS PROVIDED AS A COURTESY TO THE ATARI COMMUNITY,
AND IS NOT AN OFFICIALLY SUPPORTED RELEASE. ATARI ASSUMES NO
RESPONSIBILITY FOR PROBLEMS ARISING FROM ITS USE. FOR THE
LATEST OFFICIAL OPERATING SYSTEM RELEASE, SEE YOUR LOCAL DEALER.

in the Desktop "About..." dialog box. Then Atari will be able to separate the real 1.4ers from the EPROMmed ones, and deal with each appropriately. (Actually, ideally the startup code would do a CRC or checksum on the OS image, inserting that message if it found a difference -- but putting it there all the time is fine, too.)

The second is to really do interim OS releases on disk. Apple and Commodore have been doing that for years, and they haven't had the problems Atari is afraid of. I don't expect this to happen, but it would be nice.

So far I've restrained myself from finding someone with 1.4 and just copying the whole kit and kaboodle to disk; I'd rather have an official set of chips. I imagine many others are in the same position. They, and I, aren't going to hold off much longer.

Well, that's my turn on the soapbox. Standard disclaimer here.

>6 chip set in the first place if you don't feel you can use them?
>

because that's all that you were offering if you wanted the upgrade. sheesh.
don't worry, i'm not getting personal ... :-)

>| if we here at electrohome don't have to butcher our motherboard [...]
>The modification to install 6 ROM chips in a machine currently using 2 ROMs
>is in no way a butcher job. It is a simple, clean modification, which was
>part of the original design of the machines when they went from 6 chips to 2.
>It does, however, require some electronics and soldering experience.

imho, a butcher job requires the cutting of pins and soldering in things
that weren't originally there. a simple, clean mod would mean simply changing
a jumper, or replacing a rom. anyways, enough semantics.

with a bit of work, we got the 6 sockets in, removed the 0 ohm resistors
that you guys were using as jumpers and put in real jumpers so that we
can switch back and forth between the original 2 rom set to the 6 eprom set.
makes it kind of nice this way. (why weren't real jumper pins used anyways??
cost reductions???) (don't take this personally, i'm just curious!!)

>| the 6 eproms make the atari feel like its a cheap clone of the real thing.
>I can't believe what I'm reading here. EPROMs were made available due to

>As soon as OTP's were available, _they_ were sold instead, and likewise
>with masked ROMs.
>
>If the "cheap clone" statement was intended to be a joke, it's a bad
>joke. In case you can't tell, this is an extremely sensitive issue with
>me personally, because I personally worked very hard to make the
>Rainbow TOS ROMs available to developers and to the general public.
>I am truly appreciative of all the Emails of thanks that I've gotten.
>I also truly take complaints very seriously.

sorry to offend you ken, but originally, all that was available was the
eprom set. now i hear that masked programmed roms are available, and you
say that you will not accept a trade: eproms for masked programmed roms.
to me, having eproms instead of the roms just doesn't make me feel like

i've got my full money's worth. anyways, that's my opinion, and i didn't
mean to offend you, as i said earlier. accept my apology ken.
(i've got tech questions that need answering) :-)

anyways, in a posting i did a couple of weeks ago, i stated that when
our department at electrohome got our dev kit, everything was a mess inside
the box, whereas some developers in the states got binders and stuff. what
is the status on this. will ALL developers get this treatment??

and furthermore, with our tos 1.4 upgrade, the release notes, as i stated
in that posting as well, were shrunken down photocopies which are not
all that readable. little things like this make atari look like a joke. since
we did pay our developers fee, can we *please* get proper, readable notes
for the tos 1.4 upgrade. i would like to hear an answer on this. i feel
as a developer, i'm entitled to an answer.

and finally, thanx for tos 1.4. no more complaints! :-)

3364. tos 1.4 problem?

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 21:36:18 UTC
From: ignac@electro.UUCP
Message-ID: <1214@electro.UUCP>
Source record: 246536

over the last couple of weeks, we've developed (for internal use only, unfortunately) a co-processor board for the atari mega st which will communicate to the electrohome JAZZ digital video effects processor. this allows the atari to talk to the processor to tell it to do things like video zooms, rotations, and special effects like checkerboard wipes, etc.

anyways, now that the board is working, i've begun to write some software and i've come across a peculiar problem. we have 128K of RAM mapped in at $C00000 to $C1FFFF. (these are addresses that the developer docs say are reserved for mega expansion boards). we have tos 1.4 installed in our system.

in my software, i wanted to be able to the following:

```
wHandle = Fcreate ("image.bin", 0);
if (wHandle >= 0)
{
Fwrite (wHandle, 0x20000L, (char *)0xC00000L);
Fclose (wHandle);
}
```

and the converse when restoring the data back into that addresses space.

now, what happened when this was run was that the computer locked up. the hard disk light stayed on solid (but no writing was being done). if the address of the buffer is changed to something in main memory, there are no problems.

is this a problem with the atari DMA? is there anything special that needs to be designed into RAM on a mega expansion board to allow DMA to occur? does the DMA chip croak if you attempt to do an Fread/Fwrite outside of main memory (i've also noticed that trying to Fwrite ROM writes out complete garbage)?

anyone else noticed these problems???

an answer on this soon would be appreciated. (who's the hardware guru at atari??)

also, is it possible to order replacement blitters??? our's is not behaving properly anymore (bus errors when certain blitter locations are accessed, but everything works fine when the blitter is turned off in the desktop.inf file)

3365. How to get new members??

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 22:31:58 UTC
From: covertr@force.UUCP
Message-ID: <471d2ea5.14a1f@force.UUCP>
Source record: 246537

I am the new President of the Phoenix Atari ST Club here in
Phoenix AZ. We have only about 25 active members in our club,
and I would like ideas from other club members on how to recruit
new members.

Phoenix is part of a metropolitian area of about 2 million people.
We have 2 or 3 stores which sell ST products, the best being Computer
Works in Glendale AZ. Henry sells 2-5 STs each day, so there SHOULD
be a lot of people who aren't members of our club but who have STs.
Our Club only has a cash reserve of $800 so we can't buy paid advertisement
on comeerical TV.

So, how can we get the word out about our club??

Are there any other STers out there who belong to a club?

What about you folks across the Big Pond. How do your ST Clubs
work??

Right now we are in the process of splitting from the original 8bit
Atari club. We are planning on using the Michigan AIM magazine as our
newsletter as we are too small to do our own. AIM would be mailed to
each of our paidup members. We would submit our Club minutes, which
would appear in the AIM magazine.

We have published our own small newsletter called PHASTE using PageStream
and the SLM804 laser printer. That has gone well.

One member suggested printing up ST CLub business cards which would be
included with each ST sold by Computer Works. Henry Ahle (CW owner) would
go along with this. Another idea is to include a free AIM magazine with
each ST sold.

We are also planning to mail a postcard to each paidup member a week before
each meeting. But that doesn't get new members. Our ST Club sponsors a fulltime
2400 baud BBS called ST BASE in Phoenix. Club members can d/l PD files from
ST BASE w/o charge. This encourages ST Club membership. But not all ST owners
have 2400 baud modems.

We could try advertising on the local access channel of the Phoenix cable TV
system. But would that get new members?

And finally, our ST Club meets in the large room of a Church. The room isn't
air conditioned and has a large noisy refrigator. It is not a nice area to meet,
especially during the summer when it gets over 115 degrees here in Phoenix.
Where do other ST clubs meet?? When I was a member of the Chicago Area Computer
Hobbyist Exchange (cache) we meet in a community (two year) college in Chicago.

The college was locate on a bus route so folks could get there. Unfortunately, colleges want big bucks around here to use their rooms, and our club can't afford them. Any ideas about where to hold meetings??

As you can see I would really like to see more new members. I think that a strong local club is an asset for both novice and experienced computer owners. I have learned a lot just helping folks use their STs.

And finally, is there ANYTHING that Atari can do to help us?? I don't know who to contact at Atari. I don't believe that our Club was ever registered with anyone at Atari. Maybe someone at Atari could give me ideas on how to attract new members. I would be open to any suggestion.

Rich Covert

P.S. I was drafted for this position, and didn't want it. But now that I am Club Prez I want to encourage folks to join, and really expand our little club. That way next time, someone else can have the thrill of saying that they are club pres!

P.P.S. I was vice president of a Denver club back in 1986/1987 and we had the same problems there. But we meet in a Denver High School classroom. It was an 8bit club and I am not sure what has happened to it since I moved from Denver.

>to take the existence of such guys for granted: if they get burned enough,
>they'll just go work somewhere else. We cannot afford that. Dave Small sells
>STs with his work, and that helps keep my machine viable.
>

I cannot believe I am reading this. The hidden suppositions in this way
of thinking are truly amazing:

1. DAVID SMALL IS A SMALL BUSINESSMAN AND THEREFORE DESERVES SPECIAL PROTECTION.

Nonsense. There is nothing magical about a small businessman. Small
businessmen should be subject to the same level of competition as everyone
else; if they are good, they succeed and become big businessmen. If they are
not good, then the person who can produce it Better, Cheaper is the one we
"cannot afford <to have go work somewhere else>".
Incidentally, when is the magical point when we decide that David
Small is no longer a small businessman? Potentially, he stands to make a lot
of money producing, in "cooperation :^)" with Atari, a very cheap Mac. Lotus
was once a very small company with a big idea, too. When is it going to be OK
to "steal David's thunder"?

2. DAVID SMALL IS A GENIUS WHO MAY FAIL IF HE FACES COMPETITION.

Nonsense. Amazing how people who respect his accomplishments think he may immediately fall flat on his face because he faces competition. That doesn't say a lot for your opinion of him, does it? In fact, if he does face serious competition from someone (I personally do not think it likely) he will move onwards and upwards, produce new products, constantly push the technology edge, JUST EXACTLY AS HE IS DOING NOW!

3. SHAREWARE IS NOT OK IF IT DUPLICATES SMALL BUSINESSPERSON'S SOFTWARE.

Hmmm. I wonder what shareware/freeware you own that you could have paid for, that could have supported a small businessperson? You may very well be consistent in this philosophy, but I guarantee most other people aren't. You using Uniterm, for instance? Gulam?
Remember, even if a BIG company is issuing a product, it may have purchased the product for distribution from a small businessperson. Does that small businessperson have royalties? Will the company purchase any more products from a small businessperson who's products have been undermined by shareware/freeware? Are you against shareware/freeware as a concept? If it duplicates anything a profession group has done, it is going to hurt someone "small" (as opposed to big, not "David" :^)) somewhere down the line...

4. UNSUPPORTED SHAREWARE WILL BE SNAPPED UP IN PREFERENCE TO SUPPORTED PROFESSIONAL SOFTWARE.

Well, I notice Flash is still selling, in spite of glowing reviews and the easy availability of Uniterm. In fact, the competition to Dave would be in price points. Anyone who is willing to spend 400 bucks for a Mac will probably opt for the supported Mac emulator by the man with the big rep; anyone who is not interested enough to spend 400 bucks but might still want a Mac if the price is right and they don't care for much support will purchase the shareware (or just use it, as is the risk of shareware). They will not be competing in the same market.

5. IF DAVID GETS BURNED BY SHAREWARE, HE WILL MOVE ON TO SOMEWHERE ELSE.

Where? Every computer I know has shareware/freeware. This is not an Atari-only phenomenon. Sorry, I think David is smarter than to assume that "moving on" will solve his problems. I'd be much more concerned that he might realize that the potentials to sell anything he does on more major computers is likely to gross greater returns...

6. THIS OTHER GUY IS NOT WORTHY OF CONSIDERATION.

I may misremember this mail, but what I recall is that both these products were developed independently, and found different market niches (American vs. Europe). This other guy (I wish I knew his name! I'm not intentionally being insulting) got stomped on by Apple, and was put out of business. David has not been stomped on by Apple...yet. This other guy may very well be in the same league as Dave, but "nipped in the bud". Why does this make Dave more worthy of support?

Just about the only thing I can agree with is that the product should check that the Mac roms are roms, not EPROMS. I think that this may be necessary, anyway, to avoid getting sued by Apple (it happened to this guy

once, you know...Apple is quite prepared to do this if they can, and tie up assets if they can't).

I am not interested in a Mac emulator at any reasonable price (OK, 10 bucks? Well, if I don't have to do any work...). If I was, I would personally use David's, because I would want the support on such a complicated product, and because I wouldn't want to build the necessary hardware myself. However, I find this "David Small is a Ghod and we must do anything to keep him happy" philosophy repellent and, in a backwards sort of way, insulting to Dave. I respect him (not worship) and I believe he will do just fine, competition or no. You should, too.

Incidentally, has anyone asked Dave how he feels about this competition? I bet he's not particularly worried...

Robert

3368. Degas --> PostScript

Newsgroup: comp.sys.atari.st
Date: 1989-11-28 23:53:00 UTC
From: EDGINGTC@Wabash.BITNET
Message-ID: <8911300802.AA07884@ucbvax.Berkeley.EDU>

Source record: 246542

Here is what I've done to my machine: Mega 2, upgraded to 4 megs, with a six chip EPROM TOS 1.4 set (dealer installed - honest.) When I got the TOS 1.4 installed - all hell broke loose - bus errors, random bombs, etc. Spectre GCR was unuseable. When I had the 4 meg upgrade done they aslo replaced the two LS 373 chips with AS373 chips. Since then the machine has been 100% without a bus error to be seen and Spectre GCR is 100%.

Cartridge Sale, just in time for Christmas!

1- DeskCart! A small 64K ROM cartridge that adds a battery-operated
clock, and many powerful accessories (all of which
occupy just one .ACC slot!) including: a powerful
calendar with appointment input and alarms, a notebook,
cardfile, calculator, address book and dailer, VT-52
terminal, keyboard macros, ramdisk, disk utilities,
disk formatter, print spooler, new control panel,
screen dump, and a memory test (whew!)

First $29 gets it.

2- Happy Cartridge, option 2 with ROM sockets and selectable program
switches. The ultimate disk copier. Retails
for well over $200,

first $145 gets it.

or buy both for a mere $160!

Software clearance (so I can afford to buy new stuff <grin>

Red Lightning SSI - $19
Firezone PSS - $12
Sorcerer Lord PSS - $12
Bismark PSS - $12
Wars in Middle Earth Melbourne - $17
Axe of Rage (Deathsword II) Epyx - $11
Colossus Chess X - $15
Universe III Omnitrend - $19

All software like new and includes original disks, docs, box, etc.

Take a $1 for every game you buy after the first one.

E-mail to xorg@cup.portal.com

>STC Technology Ltd., London Road, Harlow CM17 9NA,England.

I confess to a great deal of dismay at seeing this. Like, huh?
Lattice C v5? For the ST? Or for the Amiga only? Metacomco has been
very good about announcing updates, even for their overseas customers,
such as yours truly, and if there is a Lattice C v5 for the ST, well,
geez, I'm really disappointed they didn't send me a missive or two.
Perhaps if you clarify this point I can return to my usual paranoid
depressive state and stop worrying about where I'll be spending my
money next. Thanks in advance . . .

3375. Disappearing Disk Space

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 03:59:21 UTC
From: ladasky@codon3.berkeley.edu
Message-ID: <1989Nov29.035921.1943@agate.berkeley.edu>
Source record: 246547

I just had something terribly unpleasant happen to me... I'm using Dr T's Copyist to assemble PostScript files of my music. For those of you who have worked with PostScript, you're aware that files can be pretty huge - up to 300k/page. Anyway, I have a bunch of disks onto each of which I had placed a Copyist source file and a PostScript file. I deleted the old Post-Script files in anticipation of updating them - and lo and behold, the amount of free space on the disk did NOT increase!

Not that I normally check the amount of free space on a disk after a deletion - I found this out the hard way. The PostScript file converter in the Copyist spins your disk for about 30 minutes continuously (shame on them for not writing it to memory and saving it all at once!), and about 15 minutes into the process, each of my disks came up with a "file creation or write error" (I love how specific this message is, too). That was when I checked the disk space.

Now, I just did the deleting operation from the TOS desktop - nothing fancy (I don't have 1.4 yet). I might have thought it was a fluke except that it occurred on three different disks. Does anyone have any idea how this might have happened?

Scrolling seems easier on the STE. On the 800, to get fine scrolling,
you had to update address pointers AND delay/offsets. It sounds like
the STE can do this strictly through offsets. I may be wrong though.

How likely is it that we (users) can buy the new graphics chips and
some patches to tap some of the new features?

>>Harris.
>
>Neil Harris was the *OFFICIAL* representative of Atari Corp. *ANYTHING*
>he said, unless specifically accompanied by a disclaimer to the contrary
>was *OFFICIAL* from Atari Corp.

In the October, 1986 issue of "COMPUTE!'s Atari ST" magazine Atari President Sam Tramiel said (interview, "Sam Tramiel Speaks Out", p21):

"When the blit is ready, your 520 and your 1040 will be upgradable with the blitter. We're working that out. There will be no problem for both STs to take the blit."

What might explain this sort of behavior on Atari's part? Perhaps the answer is contained in an interview with Jack Tramiel that appeared in the Winter, 1986 issue of "STart".

The interviewer said: "The Wall Street Journal wrote, 'Commodore under Jack Tramiel was notorious for announcing products that never made it to retailers' shelves.' That's a perception that must create difficulty in dealing with retailers."

Jack replied: "The retailers, or anyone else I would have problems with - they do not understand the market, and they must be selling other products than mine so they like to say what I'm doing is wrong. When you plan a product that normally takes 12 months or longer better technology can be produced during that time. Then it's important to kill the product before it reaches the market because it's very expensive to kill after it comes out. I am not afraid to announce my intentions, but I'm very careful before I put it on a dealer's shelf. Anyway, I'm not working for the Wall Street Journal. What they say really doesnn't interest me."

What happened to Atari's plans to publish and sell professional quality
documentation? Earlier this year the Atari spokesman on GEnie said that
it was nearly ready to go to the printers.

Why is Atari the only maker of mass-market computers that doesn't publish
technical info or at least work with publishers preparing such material?

In my 1040 it was the memory controller. The ST was sensitive to the slightest
tremor, so I opened it up, and touched the ICs. I took out the culprit, cleaned
it by scratching the contacts of the IC and the socket, and put it back together.
Everything works fine. One warning: visit an electronics store first, and get
a anti-static wrist band to connect yourself to the Atari PC board. CMOS is
not as sensitive as a few years back, but those Atari ICs are expensive.

Opening the ST was not very problematic, I only needed pliers and a set of
screwdrivers. Be careful when you take these LLC ICs from their sockets.

Hi,

The files with FORM (like the readme) tell most of the
story, but for people who would like to know before they
unpack:

FORM needs a 1 Mbyte Atari with a hard disk.
It is very good with the standard symbolic expressions
(multivariate polynomials, functions) and in addition
it knows vectors and indices.
It has exptensive capabilities for pattern matching when
making substitutions.
It is set up for very large expressions and is by far the
fastest program for such big expressions that I know of.
(big means > 10^5 terms)
It has most of the features of a regular programming language
and then some.

It does NOT have a large knowledge library like maple, mathematica
reduce and macsyma. You will have to provide the algorithms for
solving difficult problems yourself. This is what you have to
do most of the time anyway when you have large problems.
Such algorithms can be stored inside procedures that can be picked up
dynamically. (They are in the regular FORM language).

There is a manual with many examples.

(this is if you can read the dvi file)

Question:

I read some time ago a message from the Sozobon TOP writer
that there was no magazine feedback on the Sozobon compiler
etc. I was just wondering, as I have tried it out, although
I'm back to HiSoft Basic mostly, it is one of the better
compilers out there... The optimizer (the new one posted earlier)
does great optimization with registerizing of variables etc.
The only fallback is that a good gemlib set up was impossible
for me to implement. Is it that it is too good? There haven't
been any write ups on Uniterm either to my knowledge... A couple
of free ware products that could put Laser C2.0 an some others
to shame if fully implemented.

These guys are one of the reason I love my ST. Hacks just programming
for programming's sake. It's the closest to an artform that
programming can come. I think some of the magazines should do
some interviews with these guys. Hell, I'll call Simon Poole when
I go home to Basel for Christmas...

Just some thoughts... -Spieu! G.M.L-K.

3390. BigScreen, 1.2meg drive adj.

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 10:39:40 UTC
From: glk3593@uxf.cso.uiuc.edu
Message-ID: <46300083@uxf.cso.uiuc.edu>
Source record: 246462

Has anyone done the bigscreen enhancement? Does it work
with Spectre? Does anyone care? Should I post my results
after I hack it out? Please take the time and send
me some info if you've done it?

Has anyone done the 1.2meg adjustment to their drive?
Same as above...

-Thanks for your info-maton

Wow, fourth note... Expensive bandwidth...

Can anyone give me some hints on MacDraw file structure (or SuperPaint for that matter), PageStream file structure, Easy Draw File Structure? If anyone can help me out, I have two projects I'd like to get a start on...

Make that three...

1.) File converter... MacDraw<->PageStream<->EasyD<->SuperP?

2.) Graphing program that would output pagestream file...

3.) Dictionary converter WP<->PageStream<->1stWord+<->ProText

On a side note, I just got NeoDesk and wrote an autofolder program that selects a picture from a folder of pictures and randomly makes a new one the boot picture on boot up... I may accessorize it like that mac program if I can find out where NeoDesk stores it's pic in memory... If anyone is intersted... E-mail...

3393. TeX DVI ---> PostScript, and a postscript

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 10:51:54 UTC
From: zimm@portia.Stanford.EDU
Message-ID: <7077@portia.Stanford.EDU>
Source record: 246465

Hello. If you are not intersted in my question, but are interested
in the shareware Mac, read on anyway, because I talk about the latter
too.

Well, I've created my TeX .dvi file, but I've no idea how to turn it
into PostScript on my ST. Is a "dvi2ps" program available for the ST somewhere?
I've no facility whatsoever with C compilers, so sources aren't much use.
Also, I've downloaded everything in sight off the servers and can't find
a dvi to ps. Any ideas anyone?

While I'm here, I should make a short postscript to a previous article I
posted about why I thought a shareware Mac emulator should not be pursued.
In it, I said that such a thing would hurt Dave Small, and it is not in any
ST user's interest to hurt Dave Small. Some people have interpreted this
as my saying that we don't have the "right" to make a shareware Mac emulator,
or that it would be "unethical." I'm not saying anything of the kind. I'M
SIMPLY SAYING THAT IT IS IN *OUR* *INTERESTS* NOT TO DEVELOP SUCH AN EMULATOR,
BECAUSE IT IS IN *OUR* *INTERESTS* NOT TO HURT DAVID SMALL'S BUSINESS. IT
IS, IN EFFECT, SELF-SERVING NOT TO DEVELOP THIS EMULATOR (I claim). I am not
rejecting capitalism, competition, etc. as someone implied (well, maybe I'm
saying competition wouldn't be fruitful in this case; it's not like Dave Small
could do any better than he's doing, so how will a competitor help?)

For those who say that "I'll save a lot of money [because I
won't have to buy Spectre]" please see my and
other people's postings on the subject...I think there are deeper issues
than money to be saved, and I don't even think there is much money to
be saved anyway.

Is anyone actually working on this Mac thing, and if they are would they care
to comment?

Dylan

3394. SIMULA (Was: Re: C++ on ST?)

In article <2455@stl.stc.co.uk> "David Price" <dhp@stl.stc.co.uk> writes:
>Alternatively, are there any C/C++ developers listening who are adventurous
>enough to release the *first* accessible Object-Oriented language for the ST?
>(NB Little Smalltalk is not suitable for large scale development and the
>Dortmund Smalltalk-80 is too expensive (about 600 sterling) and needs 4Mb)

If you want to do object oriented programming you definitly
should have a look at SIMULA. SIMULA is an object oriented
programming language available on a bunch of machines
including the Atari ST (see below). This is what you get:

- Object oriented programming. A typical SIMULA program
consists of a set of interacting processes or *objects*.
Objects are incarnations of some proto-object or *class*,
generated (and later perhaps terminated) during the execution
of the program. In this manner a program written in SIMULA
may map the problem solution conveniently and cleanly.

- Objects may act independently of each other in
"quasi-parallel". This enables the class objects to act as
coroutines, so that the action of one object may be
temporarily suspended, later to be resumed at the exact point
of suspension. This feature is not found in other high-level
languages.

- List processing. The class "Simset" may be applied to add
list processing capabilities to the language. The programmer
will then have tools available for the manipulation of queues
in an efficient manner (definition of queues, insertion and
deletion operations etc.)

- Simulation. Application of the built-in class "Simulation"
extends SIMULA to a powerful tool for discrete simulation.

- Modularisation. Separate compilation of classes and
procedures is an integral part of the language. The language
demands complete type compatibility between the definition
and the usage of such separately compiled modules. Thus the
construction of larger SIMULA systems may be divided into
subtasks, each of which may be parcelled out to different
work groups, without running the risk of corruption due to
wrong assumptions about attribute types.

- SIMULA programs are highly portable between different computer systems (source code compatibility).

- Powerful text handling, dynamic arrays, flexible file handling, etc.

Some properties of the SIMULA system for the Atari ST:

- Full SIMULA language standard.
(Well, this will be true from version 2.1 on. The real arithmetic in the current version 2.0 is not quite error free.)

- Compact implementation. The complete system fits on one double-side disk.

- Small. The compiler needs less than 1 MB even when compiling modules consisting of several thousands of source lines.

- Fast. Compiling of a source file with say 1000 lines of code needs only one minute. The speed of executable SIMULA programs is comparable with that of other high-level languages.

- Complete interfaces to TOS and GEM.

- Implementation of a symbolic debugger (source-code debugger) is under development.

Version 2.1 will be available in January 1990 probably. The price is DM 198,- (ca. 110,- US$ / 71 Pound Sterling today). Reduced price for students etc. is DM 148,-.

Whoever wants to start using SIMULA *now* can spend an extra DM 15,- and get version 2.0 immediately. Version 2.1 will be delivered as soon as it is available.

Send your SIMULA request to simula@unido.uucp or simula@unido.bitnet.

Message-ID: <2562@istop.ist.CO.UK>
Source record: 246469
Cross-posted to: rec.games.misc,comp.sys.atari.st

After 8 weeks of trying, it appears as though I will get a working copy of Mirrorsoft's "TV Sports Football" for the ST. I have a 520 STFM (with a 0.5 Meg internal drive) and the original release of the game simply will not run on it.

After being told on numerous occasions by distributors and local stores that Mirrorsoft would not acknowledge the problem, I decided to talk to them directly. They told me that the problem was recognised and that a revised version would be sent as soon as I returned my copy.

Therefore if anyone's bought, or is about to buy, this product, please take note.

3398. Help with Absoft Fortran

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 14:05:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <891129140519.793251@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 246470

I have problems with Absoft Fortran. I am porting Erlgraph 2.1, a graphics library of about 650 routines, to the ST. It is easy to compile the routines. But I have problems to create the libraries (as the Absoft's libraries are restricted to at most 210 routines, at least 4 libraries are needed):
The librarian is very rudimentary. You cannot drive it by command line arguments or a script file. And input redirection from gulam doesn't work. Of course, I don't want to type in 650 names by hand. And I want to avoid to look into the program with a dissassembler and search for a possibility to patch it.

Is there any substitution for the librarian/linker system? Since I use Gulam and GNU make, I would prefer command line driven substitutes if they exist. A linker that can use libraries in GNU format would be great since I have gcc-ar.

Side question: is there any utility to convert dri and/or Absoft objects to GNU objects and vice versa? I am not able to write such a thing. But I would like to write the machine dependent parts of the GKS-Metafile drivers in C.

Thanks!

From: greg.trice@canremote.uucp
Message-ID: <89120107511652@masnet.uucp>
Source record: 246472

Why does everybody assume that a Mac emulator has to use Mac ROMs or any Mac code at all? There are an infinite number of ways to do a given job and it is perfectly possible for somebody to carefully read all the Mac documentation and then sit down and write code that will do exactly the same job as the Mac roms, but have not a byte in common with them in code. This is the situation with most IBM compatible systems. Though they are functionally identical to the IBM product, their ROMs contain different, but functionally identical code.
It should be perfectly possible to produce a Mac emulator that used no ROMs at all, but was wholly disk based (given sufficient memory to hold the quondam ROM code in RAM).

'Impossible' is a word best left out of computer hacker's works. Dave Small checks for illegal ROMs/EPROMs in his Spectre 128 and Spectre GCR cartridges. ROMs and EPROMS aren't EXACTLY the same, in some manner. Perhaps he tests the speed of retrieval. Perhaps he tests some sort of electrical property, such as resistance or somesuch (I know nothing about this, but it's just an idea).

If the author of the software invites people to illegally copy ROMs or whatnot, then 99 times out of 100, the user will copy the ROMs. Especially if you HAVE to.

I sure hope that the ST market here in the States improves soon because
1989 has been a real killer for US ST magazines. I count the following
as having died in 1989:

ST APPLICATIONS -- a fine little Mom and Pop magazine which started out in
life as a small newsletter but which grew into a full
magazine. ST APPS had many good programming articles and
had the best game reviews of any mag. If a game was bad,
ST APPS said so. Some mags just publish the PR put out
by the game company and little else. I really miss
ST APPS.

ST LOG -- Another excellent ST magazine which had great C programming
articles and good reviews. Merged with ANALOG in the
November 1989 issue. Died with ANALOG in the December 1989
issue.

ANALOG -- Not really an ST mag but died nonethe less.

ANTIC -- Not dead yet, but rumors have it dying Real Soon Now.

STart -- Still around, and can be bought at my local WaldenBook
store.

I understand that the ANTIC/STart publishers have written off the entire
Atari US market. Witness the fact that the ANTIC "THE CATALOG" does not
appear in STart any longer. and the fact that ANTIC has stopped developing
new ST software. It is a sad day when a major software publisher stops
publishing new software for your computer. I also understand that ANTIC now
publishes an Amiga magazine which is going strong.
B

And that's all of the full magazines that I have ever seen in the US. There
are a couple of tabloid newsletters/magazines but they have NEVER been sold
by WALDENBOOKS or by B.Dalton's Booksellers. They are ST INFORMER, ST WORLD

(the US tabloid not the UK magazine)

So, the questions is "Why have these magazines died?".
I think that the answer is that magazines rely mainly on advertisments for survival. The subscription costs does not cover the cost of publishing a magazine. Advertisements do that. And when Atari Corp decided not to allow mail order sales of ST products the advertisements stopped in the magazines. Add to that the fewer number of third party software and even fewer hardware vendors for the ST and you can see why ST mags are dying.

Finally, the question is "Can it be changed?"
I think that it can. And I hope that Atari Corp follows through. I have read that Charles Cherry wants to introduce a new technique whereby ST SW publishers send a demo oversion of their products. Atari Corp would press a CD ROM with ALL of the current ST SW (demos of course) which the full service ST dealers could demo to ST customers. This would give an advantage to ST Dealers over the mail order companies, which couldn't demo the SW. And it would not mean that dealers would have to demo actual SW. Dealers would demo a CD ROM with demo SW. A great idea. I hope that Atari Corp follows thru on this.

| replaced the two LS 373 chips with AS373 chips. Since then the machine has
| been 100% without a bus error to be seen and Spectre GCR is 100%.

The hardware guys at Atari are looking into this problem. It looks like it may be a bus loading problem caused by the GCR. I wonder, has anyone noticed this problem occurring _without_ a cartridge plugged in? The Atari hardware guys I've talked to say that the cart port is on the hairy edge - basically, if you hang anything but ROM's out there, you're asking for trouble. It was _designed_ this way, the intent of the cart port is to provide ROM space, nothing else.

One other thing, there were some Mega 2's which were produced that are NOT upgradable to 4 megs because of the parts used in manufacture. I don't know the details, but just thought I'd let people know, in case you're thinking of dropping an extra 2 megs of RAM in, it may not be that easy. Atari dealers should be able to get the scoop on this from the dealer support folks at Atari.

Source record: 246478

Steve Yelvington basically states that he wishes someone would write a 'generic' background file transfer program that would have a message pasing system to start transfers (or some such).

Steve:

SHADOW (our product sold by ANTIC) does just that. It completely works in the background (during .PRG, .TOS and .TTP programs) and can even survive system resets and still keep the file transfer going. It doesn't slow the machine down, and is 99.5% compatible with software out there. The calling sequences to access SHADOW are well documented, and we even provide source code libraries in ASM and GFA BASIC, and a .O file to link with for even easier access.

Several PD/SHAREWARE terminal programs and FLASH! have support built-in. Heck, even GULAM could have the calls built-in (if he put them in there).

SHADOW is 100% assembly and is FAST! I would venture to say that it is about the most efficient file transfer program out for the ST (CPS thruput).

Hope that helps. SHADOW retails for $29.95, but we can send it for $20.

Sorry for the advert...

Mainly for UK ST'ers...

I now hear that Atari UK have ordered the TOS1.4 roms from Atari Taiwan, and that they will be available sometime (but, opinion seems, not soon) for a price well in excess of 100 quid (cf 100 dollars in the US!).

I have also discovered that Atari UK are the worst company to contact that I have ever encountered, with a telephonist whose degree of unhelpfulness plumbs constantly lower depths. "Atari-please-hold..... (25 minutes later I gave up)". That's if they answer (50% chance). I can quite easily believe that this bunch of wazzocks are entirely responsible for the non-appearance of TOS 1.4 here.

Jan Ameij,
Oxford University Department of Applied Metaphysics,
ameij@ox.vax

PS: Ken B. and Allan P., please don't take offence, I realize this has nothing to do with you or Atari US.

> Alan Chan
> abc@arthur.cs.purdue.edu

That is funny, because I bought my Gemini-10X over 10 years ago, back
when the original Epson mx-80 came out. And the Gemini-10X was NEVER
100% compatible with the Epson mx/fx-80 printers. All kinds of programs
broke when using the old Gemini-10X. Which is a shame because the Gemini-10X
was a very reliable dependable printer. I perferred it over the mx-80 printers.
I used my Gemini-10X with my S-100 buss computer (remember the z80 and cpm80?).
and it worked fine in most applications.

But the 10X never worked quite right with ST programs.

Oh well, buy a new 24 pin printer, it has better printouts and you can buy
a new 24 pin printer for < $300.00 (USD of course).

Gee, and I thought that the 10X printers would be all gone by now. shows just
how good they are if they are still in use after 10 years!!

3409. Help with Uniterm 2.0e

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 17:33:05 UTC
From: charlop@blake.acs.washington.edu
Message-ID: <4685@blake.acs.washington.edu>
Source record: 246481

I have just down loaded Uniterm 2.0e from Terminator. When I tried it from home last night, I ran into a problem. The dialing would get locked into dialing one number if there was anything wrong with the dialup. For example, if the number I was dialing was busy, then the modem would report it and any keypress in Uniterm would cause an automatic redial of the number. Also when the connection was made, all I got was garbage on the screen as if I was using the wrong baud rate. After hanging up and trying to dial another number, Uniterm would instead dial the previous number. The [control] C did not get me out of dialing mode. Nothing would work and I would have to reboot the computer. Can anyone tell me what I am doing wrong. The setup of the terminal is the same that works in my previous terminal program. My setup is a 1040ST, TOS 1.4, TurboST 1.6, Multidesk, Cache090, Maccel2, G+PLus, and Megadisk as a 1Meg RamDisk.

Thanx in advance.

Alright, I guess it's time to post this message again (is this the 3rd
time now?). The quoted message is mostly correct, but incomplete. The
situation is slightly different if you're in the /AUTO/ folder programs
at boot-time. I check for the text-base pointer pointing to ROM, as
recommended by Alan Pratt @ Atari. The following code (which, like John's
code, assumes access to a basepage pointer) uses this "approved" method.
I've also included a copy of <basepage.h> from dLibs for those who don't
know the layout of the basepage structure.

/*************************************************************************/
#include <basepage.h>

#define FROM_AUTO 0
#define FROM_DESKTOP 1
#define FROM_SHELL 2

camefrom()
{
register BASEPAGE *p = _base;
register int n = 0;

p = p->p_parent;
if((((long) (p->p_tbase)) & 0x800000L) == 0L)
return(FROM_SHELL);
while(p = p->p_parent)
++n;
return((n == 1) ? FROM_AUTO : ((n == 2) ? FROM_DESKTOP : FROM_SHELL));
}
/*************************************************************************/
/*

3411. breakdown

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 18:35:11 UTC
From: markez@csd4.csd.uwm.edu
Message-ID: <1251@uwm.edu>
Source record: 246483

I have been having a few problems with my ST recently.

1. My monitor sound is very quiet, even with the volume at maximum.
I noticed this several months agos, and it seems to be getting worse.
It is an SC1224, Goldstar, manufactured May 1986.

2. Recently, while working with my Kawai K-1 and 520, the MIDI out
stopped working. The MIDI in still works, however. It went dead
right after I turned on my amp.

I should probably take the components to an an authorized dealer, but
I am a very poor college student, and I would like to fix them myself
if it is possible.

{specific request deleted}
Hear, Hear! All I've been seeing is flames about hardware and
the way Atari is run. We can do little about those things, but
isn't there something we can do to turn around the small and
shrinking (at least in the U.S.A.) applications software base?
I can't find software titles that were out years ago, e.g. some
compilers, an on-the-fly keyboard macro program, an outliner-word
processor like More on the Mac (all there ever was was Hippo Concept),
and new ones are not out there replacing them. If this doesn't
change soon I may be forced to go to permanent emulation (haven't
done it at all - yet ;-}). Constructive suggestions desired.

I can certainly understand why Atari protects their ROMs...

They do it for the same reason that Apple protects theirs. If Mac ROMs were freely redistributable, then Mac emulators would be EVERYWHERE! What would that do to Apple?

Ah, you're thinking "Yes, but who in their right mind would want to emulate an ST?" Amiga owners, for one. About a month ago, there was a lot of traffic on comp.sys.amiga regarding a P.D. Atari ST emulator which DIDN'T WORK! It seems that the original version of the emulator (which was distributed on disk) had illegal copies of Atari ROMs stored on "unused" sectors of the disk. When somebody uploaded it, they forgot to upload the illegal ROMs. So anybody who downloaded the emulator got a useless package.

Some people wondered if they were using it wrong. Some were angry because they had gone to a lot of trouble and still hadn't managed to steal anything. Some jokingly said "Yep, real Atari's work that way, too."

Nobody said "This is wrong. We *shouldn't* copy Atari ROMs like this."

>Why Not, I ask? If people want to burn their own ROMS, why not let
>them? Atari should even provide diagnostic files that can be run to
>test the validity of user-generated ROMS.

Because they can't trust us to use them as Atari intended.
Because they have a reputation to protect (such as it is).
Because they don't want to support a product that doesn't earn them money.
Because copyrights can be lost if they aren't enforced.
Because parts of the ROMs are really copyrighted by DRI, not Atari.

This usually happens because you archived the file with an encryption
key, and forgot to use the key when trying to extract it. (I've been
asked to "rescue" a couple "trashed" archives where this was the case.
Personally I'd blow off encryption. Just a hassle for your own use,
and really only a minor problem for some determined person to decrypt.)

Will this new graphics chip used in the STE be pin to pin compatible
with the one currently in the ST? Can we actually BUY a STE graphics
chip and put it into the ST? It would be nice if we could.

mjv@iris.brown.edu (Marshall Vale) writes:

|I have several questions about chips in my Mega2.
|
|I've been thinking about upgrading to TOS 1.4 and have read the messages
| about the weak power chips.

Based on my experience with the 6 chip ROM set in my Mega 2 (of an older vintage), I heartily recommend changing those 74LS373's to 74AS373's if you install a 6 chip set of ROMs. You might get by with the existing chips, and you might not. It's cheaper to have them put in during the ROM upgrade while things are apart than to do it later if it proves necessary.

|
|I also noticed that there was a very tiny board on top of the 68000 with a
|_SCST74LS74B1_ in it and a wire running to an unlabeled spot on the
|board just above and to the left of the 68000. Anyone know what its for?
| It seems like it was a rather last minute change and the glue job was
| very sloppy.

Hmmm, my Mega has a similar kludge except the extra chip is piggy-backed on another small TTL chip. It's pretty sloppy, too. I assumed the dealer did this in the ROM upgrade, maybe not, eh?

3422. NEODESK RANDOM PICTURE SELECTOR 1.0

Newsgroup: comp.sys.atari.st
Date: 1989-11-29 20:07:00 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500074@uxa.cso.uiuc.edu>
Source record: 246494

To those of you who requested it, but the mail bounced...
Available at umich (35.1.33.8) in atari/new/nrps.arc...

Sorry about the control-M chars, forgot to switch off binary.

Neodesk Random Picture Selector V1.0 Documentation...

Place NRPS.PRG in your auto folder. It's last in mine after pinhead, mouse doubler, startgem etc., but I don't think it matters. The paths default to C:\NEODESK for the neodesk location and E:\CLIPART for the location of your *.PI2 and *.PI3 pictures. If you would like to change these, either sector edit the program or create a file called NRPS.INF in your root directory with the first line being the location of the NEOMASTR.PRG and the second line being the location of your PI? files. Do not include the final '\' in these path listings. You may need to add a final carriage return... I have no need for this option, so it is untested.

NRPS copies a random picture into the NEODESK folder on boot using the physbase of the screen as a buffer. I don't know why this had to be so large (ca. 17K), but it is compiled in HiSoft Basic Pro, the prog size was 2K and lib size was 15K...? I may rewrite in C to shrink it, but my C: partition has room anyway. NRPS checks the resolution and upon hi, copies a PI3 extension picture otherwise a PI2 extension picture. The picture will only be changed by either rebooting or exiting NEODESK and reentering after running NRPS.

The randomizer should be fairly random as it shuffles the filenames first, then gets the seconds value from the system clock, adds it to the total files (which may be no greater than 60) and multiplies by rnd until less than total. I had trouble with other attempts, but this seems to do the trick.

I may update this as a D.A. which can shuffle pics while in NEODESK if there is any interest. I don't think there are any bugs, but I just wrote it last night...

If you happen upon one, or have any comments, call me at 217-359-7483 snail mail at 211 E. Clark #10, Champaign IL 61820 or e-mail at glk01126 @uxa.uiuc or something like that... or post to comp.sys.atari.st.

As if anyone would really want to say anything anyway...

Ciao and viel Spass damit...

Source record: 246495

ignac@electro.UUCP (Ignac Kolenko) writes:
| With our tos 1.4 upgrade, the release notes, as i stated [...]
| were shrunken down photocopies which are not all that readable.

IMPORTANT MESSAGE TO ALL REGISTERED U.S. ATARI DEVELOPERS:
IF YOU ARE A REGISTERED DEVELOPER AND YOU DO NOT HAVE THE FINAL
RAINBOW TOS RELEASE NOTES, CALL GAIL AT 408-745-2568.

There was a questionnaire sent out some months ago, and if you did not
send back that questionnaire, you are no longer listed as a registered
developer. That was supposed to be clear from the questionnaire.
Further, we are starting a re-registration program, which will be free
of charge to registered developers. Call Gail for more info.

The photocopied docs which came with the _developer release_ of Rainbow
TOS are NOT the final Rainbow TOS Release Notes. They were preliminary
and were marked as such. The final version comes in an Atari binder,
and was professionally produced by our technical documentation
department. If you do not have the final version by now, assume that
you have been purged from the list of registered developers. Do not
send me Email, and do not post a followup to this message, because
those actions will not get you on the list. CALL GAIL.

Now that that's out of the way...

| why weren't real jumper pins used [for ROM jumpers] anyways??

It's a lot easier for parts insertion machines to insert 0 ohm resistors
than jumpers. And jumpers would require verification that they were
inserted the correct way. That's what I've been told, anyways.

Regarding how developer kits are being released, I haven't seen an
actual developer kit in quite a while (since I got mine, in fact, when
I came to work here at Atari). So without information to the contrary,
I'm assuming that they still come boxed and 3-hole-perforated for
inclusion in the binders of your choice (I've got 5 big binders holding
my kit). As far as the condition of the docs, they shouldn't be torn up
or hard to read - the originals from which the docs are printed these
days are in much better shape than years ago. If you got a bad set,
please contact Gail.

Sorry, guy, the ST can only DMA from ST memory. You can't do DMA from ROM, either. You'll have to copy from the special memory to real memory, then write that to disk. If you're using Fwrite it can't be that time critical...

>>support we give to developers to end users.

I'm still carping. If the TOS 1.4 documentation is indicative of what Atari documentation is going to be like in the future, it's a gigantic step in a good direction. But I still think that making a listing of ROM contents, as of some major freeze date, with comments, available to registered developers would be a GOOD THING. Extra charges, extra confidentiality agreements and big red warnings "This is provided only as a supplement to <other documents>; Atari guarantees to break any program dependent on OS features not promised elsewhere" would be acceptable. Although I also don't see any need to make such a thing confidential. I do see the need for warnings.

Just curious. The ST is made in Taiwan. But is the ST sold in
Taiwan, or Atari Taiwan is just a company making computers for
exports (to the US and Canada and Europe?)

>Also, does anyone know of any Atari Dealers In New Jersey?
Well up ny where Atari Explorer is published(Mendham) there is an excellent
Mom+Pop outfit called Gemini Computers. he sells only Atari Hardware
and A ton of Software. Anyway specifically it is in Morristown and
he does have a good clientele(sp?).
His support is great, but he cant compete with a huge outift like J&R Musicworldin NYC.
(they are backordered so good luck with them)

ins_bac@Jhunix.bitnet
btw if you are an NJ ST owner in the 201 area code, get in touch.

Yes indeed, it is faithful. And translated precisely.

From the GEnie Information Network:

Category 19, Topic 2
Message 165 Mon Nov 27, 1989
AVANTGARDE at 15:14 EST

It has been a few weeks since we have come online here at GEnie. We apologize for the inconvenience. As most of you know, we have delays in getting pc-ditto II to market. The main reason has been a manufacturer we selected. Because we are small, we had a hard time getting reasonable quotes from companies to produce pc-ditto II. Nevertheless, we did find a company earlier this year who was eager to do the work. Unfortunately, they too were small, and as we later learned, inexperienced in doing the kind of work we required. We had suffered along with them, in part because they had us over a barrel. But, when production units were not acceptable, and they could not be reworked, we had to finally bite the bullet and move on to another manufacturer.

Until we could pass along any news, we did not want to return to GEnie with "I don't know" kind of answers. What we can say with certainty is that we have taken delivery of boards that do work (from a new manufacturer) and things are back on track here. We will be up online this weekend to answer all the messages since we were last on (I have just downloaded them, but not yet had time to read them all).

Anyway, we are still alive and producing pc-ditto II. We waited to make sure it was right, as we know that's what is expected. Thanks, and we'll talk to you later this week.

3433. Diff between TOS 1.0 and 1.2?

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 00:37:39 UTC
From: daveba@hpsad.HP.COM
Message-ID: <750031@hpsad.HP.COM>
Source record: 246405

Although I bought my Atari 1040ST in June of 1988, it appears to have TOS 1.0 in it instead of TOS 1.2 as I had expected. Would some knowledgeable person kindly outline the differences between these two TOS versions? Also, is it worth it to upgrade to TOS 1.4 (for a hundred bucks!)?

Thanks,

Dave Ballo

3434. LaTeX Calendar program!

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 01:54:16 UTC
From: mikew@wheeler.wrcr.unr.edu
Message-ID: <3176@tahoe.unr.edu>
Source record: 246406

Here is a great little C program that writes an appointment
calendar in LaTeX. You provide the LaTeX commands describing
your appointments e.g.

```
1989 12
25
\begin{itemize}
\item Go to mom's for dinner
\end{itemize}
%
```

the above would put "Go to mom's for dinner" in the square for
Dec. 25, 1989. Micro calendars for previous and next month are
drawn into appropriate areas!!

I didn't write this -- found it on comp.text set up to use
postscript fonts. I may an addition to allow computer modern
fonts to be used and added some #ifdefs:

-DUNIX to make the UNIX version else you can compile with MWC
3.2

-DPS get the original postscript font selection in place of the
computer modern patch that I stuck in.

I compiled it with MWC 3.2 ran it under msh and gulam. Output
was checked on the ST using cm fonts and showdvi.prg--- ok on
monochrome screen but flaky on my low res color screen (probably
my fonts or the OMNIRES prg). I also ran the UNIX version on a
SUN 3 (4.3 BSD) with output to an Imagen 8/300. GREAT !!

here it is .... snip .. snip .. snip... ENJOY

```
------------------------------------------------------------
/* This is "lxcal.c", a C program to produce a Calendar in LaTeX. No
* claim whatsoever is made regrading this code or the calendar-design.
* Note that no error checking is done.
* The calendar is printed on a 11in by 8.5in paper. Use your favorite
* DVI2PS with the landsacpe option.
* I found this to be a useful programming exercise both in C and LaTeX.
* Comments, suggestions and reports regarding bugs are welcome.

* Author: B. Narasimhan
* Dept. of Statistics
Florida State Univesrity
* Tallahassee, FL 32306.
* E-mail: naras@stat.fsu.edu
```

```
* I wish to thank
* William Poser
* Dept. of Linguistics
* Stanford University
* who provided the string handling routines I needed, including a new
* "itoa" and the person (I don't know the name) who posted the
* day_of_week algorithm on the net.
* Usage: lxcal [input_file] [output_file]
*
* Input should be as follows:
YEAR MONTH - Integers
DAY_NO - Integer
\begin{itemize}
\item Item_1 \\
\item Item_2 \\
......
\item Item_N \\
\end{itemize}
%
ANOTHER DAY_NO - Integer
\begin{itemize}
....
\end{itemize}
%
* and so on. The % is important. This preempts the use of %. Can anyone
* out there change this to %% instead? I tried the usual tricks and for
* some reason they all bombed and I am not willing to spend more time on
* this now.
*/
/* AN EXERCISE [M15]: This is a wrap-around calendar with 5 rows.
Some time in the future the last row will be empty, i.e.
February will have 28 days with the Ist day beginning on a Sunday.
Which is the earliest year when this happens? Can you
characterize those years (at least during your lifetime) ?

3435. Text in a GEM Window

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 02:38:08 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Nov29.214314est.58002@ugw.utcs.utoronto.ca>
Source record: 246407

There are some fast and nasty shortcuts, but you _should_ put text in a GEM window by calling v_gtext() (or something like that) _only_ in your redraw function, or when you have to draw a new character in the window. _Never_ draw to a window unless

1) You check to make sure that it is the top window
2) You walk through the wind_get() rectangle list, and clip to each of those rectangles while you redraw the window.

It's difficult. The AES will tell you when to redraw different areas of your window, and you have to be ready to respond. Keep track of the text in a separate array or linked list, so that you know what to put in the window when redraw time arrives.

The LEGAL "ROMS" my mac uses are part number 23512 - this is a windowless
eprom (OTP) version of the 27512. Therefore it IS an eprom physically but
since you can't erase it it is a rom (prom). Dave small inverts a couple
of lines on his cartridge to deter people from making their own and
copying his software (or using the magic sac!). I guess his software
re-inverts the inverted data as it is read off the cartridge.

From: tyler@stpl.UUCP
Message-ID: <201@stpl.UUCP>
Source record: 246409

The file `atari.mf' is packed with the various previewer packages that we've distributed. Its purpose is to provide those with metafont, the setup information required to generate the screen fonts. It is not a TeX/LaTeX file. Apparently, metafont is available for the ST series.

>Why didn't Atari use large ROMs for the 1040 in the first place?

I don't know, but my GUESS is that Atari made the same "mistake" that the company I work for frequently makes... they underestimated the size of the code when they specified the amount of ROM space needed while designing the hardware, by the time they realized that they needed more ROM the hardware was "set in stone" and could not be changed... so they got an "expert code compression" type programmer to try to squeeze every byte out that they could thru ANY trick possible. This is probably also part of the reason the TOS sources are so "disorganized" and difficult to read.

This happened on a machine that I worked on several years ago (and was especially bad). The system spec called for 50% unused ROM... software estimated the code could easilly fit in <2K, so the hardware was designed with 4K of ROM... However the first COMPLETE version of the code needed 5K!!! That took some VERY strange recodings to squeeze 5K of code into a 4K ROM.

The SuperPaint native file saving mode is simply PICT2 format, as described in _Inside Macintosh: Volume 5_. (SuperPaint 2.0, that is.) MacPaint format is described in some tech note or other -- it's not very hard. I think MacDraw uses PICT or PICT2 format; PICT2 is a superset of PICT, so if you build a decoder for PICT2, you get the other one for free.

I've written a PICT2 decoder as part of a larger project. It isn't hard, just tedious.

Further to the previous postings regarding my problems, George Dinolt (whom I cannot reply to, sorry George) wrote with similar experiences. He stated:

> After a lot of experimenting I determined that, on my system at least,
> the problems had to do with the position of the cable from the Memory
> Management unit to the Datafree board. ...
> ... test this yourself by just letting the Datafree memory board hang
> loose outside your system (You can leave the plastic cover off. You
> can even leave the metal shielding off for testing purposes. My ST
> sits at the edge of the desk so the memory board literaly hung from
> the two cables in my testing.

Dave Clemans (also unreachable) wrote:

> I would rather doubt a MMU chip problem. It is MUCH more likely
> that you are seeing ringing and other noise problems. A good way
> to check for this is to run a decent memory tester program when
> the board is set up for 4MB, and see where it gets errors, and what
> the patterns of error bits are. If you get randomness, it is almost
> definitely ringing or other noise problems on the dram control lines.

Well there were never any memory errors with the memory testers I used and the system was working OK under Spectre, Multifinder with lots loaded, but the two comments together rang (!) the bell.

Now, the Datafree board is supposed to be able to fit above the top shield of the motherboard (according to their documentation), but I found there was insufficient room between it and the keyboard, so I left it off. Maybe newer systems are different.

George's suggestions about operation when the board and cables dangled out the front of the disasembled ST, in particular when the ribbon from the MMU was routed away from the motherboard was a great help. I made a shield from aluminum foil covered on both sides with "MacTac" sticky plastic (for insulation). I made it about 1/2 inch larger than the memory board dimensions but left a strip of foil about 1/4 inch wide uncovered along the front (long) side. I folded the exposed strip back, punched a couple of holes thru it an the insulated part where the screws holding the motherboard were. I then fastened it down with the original screws and a couple of small washers.

Dave's comments about ringing and noise suggested I should take a look at shielding and/or terminating the ribbon cables. I figured I could do both simultaneously by increasing the capacitance of the ribbon's conductors as follows: I also completely wrapped the MMU cable with a long narrow strip

of aluminum foil, then covered it with tape to insulate it. I wrapped a bare piece of wire with the foil at the MMU end and soldered the wire to the bare groundplane on the mother board. The added capacity on the wires would slow the rise time of the pulses and reduce the ringing, if any.

After re-assembling the machine, the problems seem to be gone. I copied small files til the floppy was full several times and no crashes. I was going to supply power to the board thru a separate pair of wires too, but so far, it has been unnecessary.

Make sure the foil doesn't touch anything except the ground plane at the front of the motherboard. Heat dissipation doesn't seem a problem because the shield is covering the old memory, which is disabled anyway.

Thanks again George and Dave for the leads. I now seem to be fully operational with 4 MB of memory.

Regards, Stu Beal, VE3MWM, (U009@CCIW.BITNET),
National Water Research Institute,
Burlington, Ontario, Canada.

Ref: Mac Shareware
I am also interested in Mac Shareware and my response to Capitain also bounced. I own Magic Sac 6.1, ALadin 1.3e, Spectre 128 V.1.9F and Spectre GCR V.2.3 but I would not mind having another emulator. But how 'Capitain@ intend to go around the legal problem on Macintosh ROMs code?
Regarding the Apple IIe Emulator, I am now working on the cartridge to hold 2 Apple IIe Enhanced ROMs. Darek Mihocka may re-write his Apple II emulator software to access to this newer ROM code. I will post to the net about the progress. The BBC Micro Emulator for Atari is available as PD in England and I heard that there is a Commodore VIC-20 available somewhere in Canada. (but I can't understand who will want it). Could 'Capitain' kindly E-Mail to me? Perhap my experience with most emulator that currently available could be of some use to him. I have tested the HP LaserJet IIp for 3 weeks before decided to order one for my Atari MEGA4. Here are what I have found:
With 512K RAM It can print full page from Pagestream but 1/3 page from Calamus printing with Calamus take considerable longer time than SLM804. With Spectre I used MacPrint program and It can print at 300 x300, 150X150 and 75X75 Dpi. Macprint cames with soft Fonts therefore doesn't require extra font cartridges. Mac paint picture anc only print 1/2 page at 300x300 dpi. Page Maker 3.01 print out could get full page if there is no graphic on the page. You have to buy 1MB expansion RAM if you intend to print CALAMUS or Pagemaker documents. WordStar 4 in PC-Ditto mode print instantly with fonts from the printer itself, Underline, bold face and Italic works. You can write your own driver for 1st Word Plus quite easily but It won't print 1st Word Plus graphics. I have yet to try printing Pagemaker doc, with Adobe Type Manager. (Just got the program few days ago. Hope this info help. S.Sujarittanonta, National University of Singapore.

3445. mouse driver

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 08:06:58 UTC
From: HAHN_K@DMRHRZ11.BITNET
Message-ID: <8911300806.AA08734@ucbvax.Berkeley.EDU>
Source record: 246417

I have to write my own mouse driver for timing reasons, but I lack
any information concerning the 'default implementation' of Atari's
driver in my TOS 1985 - version, let alone the TOS 1.4 - version.
From the IKBD table I get it's address being $FD02C2 and I can
dissassemble the code, but it's not THAT easy figuring out what
the code does, actually.
Could some knowledgeable person provide some hints, commented code,
or related information ? Thanks. THANKS.
- Klaus.

3446. ICD Software: Many thanks and a question

Hello all,

many thanks to all the kind people who offered to send me the latest version of the ICD host adapter software, and to Dennis Pixton@bingvaxa who did mail it to me at my request. I can't wait to try out the driver on my disk next weekend. (Must have been the dramatic music ;-) :-)

BUT: The included ICDFMT.DAT file says Version 3.00 and lists only "d" type entries, ie. only disk drives, no more controllers, such as for my Maxtor. Is this correct?

If not, can someone please send me a copy of the current file?
Thanks to anyone who can shed some light on this mystery (or point out my mistake :-).

This is how the file looks:

Metafont for the ST is FTPable from terminator.cc.umich.edu
I've used it. It takes a long time to generate fonts on the
ST, but you can set up a batch file in GULAM to run for a
couple of days to generate all the standard TeX and LaTeX
fonts you'll need or you can use the atari.mf on a bigger
box the has metafont available. I ran it on our VM/CMS
system here.

Well, after two years of faithful service from my Atari 1040ST I went and bought one of those fast 386 computers. You know, I don't resent Atari and I still love Atari. Sure the company could do better making us Atari users happy, but for me they did well enough. And if you are considering a 386 now, don't unless you are prepared to battle an Intel beast. The 68000 family is like a rose compared to the 80x86 toadstool. They may say that they have made the registers more general and such, but not really. If you want a good 68000 machine, Atari or Amiga is the way to go. (I'd say apple, too, if not for ...)

>I agree. I've been to two Atari dealers a number of times (most recently San
>Jose Computer a couple of hours ago, which is why I'm motivated to write
>this,) and have always been told that they were out of 1.4 ROMs.

With a dealer who's 'run out', you're closer than I am to having a chipset.

>If I had a binary image of the thing, I could go put it on EPROMs and have it
>in my machine tonight, as could a number of Atari-owning friends of mine.

True. If I had a binary image of the thing I'd be Mr. Big in the UK.
Personally I'm not sure I would trust an image that I did not take myself
from an offical ROM chip. Other peoples mileage may vary.

>I realize that Atari doesn't want to deal with trying to support hundreds of
>modified versions of 1.4, which would inevitably arise if the OS were released
>in this way. There are two solutions to that problem. The first, and easiest
>, is to put something like
>
> THIS CHIPSET IS PROVIDED AS A COURTESY TO THE ATARI COMMUNITY,
> AND IS NOT AN OFFICIALLY SUPPORTED RELEASE. ATARI ASSUMES NO
> RESPONSIBILITY FOR PROBLEMS ARISING FROM ITS USE. FOR THE
> LATEST OFFICIAL OPERATING SYSTEM RELEASE, SEE YOUR LOCAL DEALER.
>
>in the Desktop "About..." dialog box. Then Atari will be able to separate
>the real 1.4ers from the EPROMmed ones, and deal with each appropriately.
>(Actually, ideally the startup code would do a CRC or checksum on the OS
>image, inserting that message if it found a difference -- but putting it
>there all the time is fine, too.)

Sounds good. But the messages and CRC code could be hacked.
I guess only dealers should get the verification program.

>The second is to really do interim OS releases on disk. Apple and Commodore
>have been doing that for years, and they haven't had the problems Atari
>is afraid of. I don't expect this to happen, but it would be nice.

NO! I don't like the wasted memory, reloading it when I trample on it (this would happen a lot to me!) and the open invitation to viruses (The ROMs are a bit tight to squeeze in a virus I reckon)

>So far I've restrained myself from finding someone with 1.4 and just copying
>the whole kit and kaboodle to disk; I'd rather have an official set of chips.
>I imagine many others are in the same position. They, and I, aren't going to
>hold off much longer.

A least you could do that. TOS 1.4 ROMs are never seen in the UK at all!

My suggestion:-
Make TOS free. Distribute original TOS ROM's to dealers only. They program the EPROMS and charge you for that. You feel better about the validity of your new ROMs. Distribution is quick, widespread and ordered.
Developers can write apps that require TOS 1.4 or later and be sure that a lack of ROM's will not halt sales. The rapidity of bug fixe distribution would be good too!

(Atari UK wouldn't like this idea because the words 'free', 'cheap' or even 'sensible' are not in their dictionary file. To them everything is a money making product :-)

>Well, that's my turn on the soapbox.

If the Rainbow TOSless UK ST owners follwed me to the soapbox then it would quickly turn to dust!

>(C or Assembly preferable) I would be most appreciative.

Alan Pratt (@atari) poste one program a while back.

As far as I recall, it made the BUERR vector point to the same place,
the RESET vector points to and then started to write 0L to any RAM
adress from the first longword behind the program code (start of BSS?)
up to 4M+1. Writing to this adress will cause a BUSERR, and BUSERR
points to the coldstart routine (pointed to by RESET)...

Any virus (or ramdisk) will die fromm the NULLs :-)

Probably, You are searching for the resistors to remove to disable half
of the on board RAM.
You have to remove just one resistor, the one in the RAS line (without
RAS a RAM will stay in Tristate forever).
RAS is pin 4 (four) of the 41 256 chips on the board and pin 3 (three)
of the megabit chips.
The RAS of the 256 chips must be disconnected from the MCU to disable
them.

Could Atari not make a pin compatible MMU chip that could replace the normal one in the ST and give us all word alligned and segmented video RAM just like the STE.

From looking at the circuitry I don't see how these features would require any pinout changes. Delaying the scan and adding the extra colours to SHIFTER would be another matter.

If Atari would make this MMU then scrolling would improve right across the ST range.

3462. GEM help wanted

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 15:10:12 UTC
From: gernot@hpuviea.UUCP
Message-ID: <1218@hpuviea.UUCP>
Source record: 246434

Dear GEM wizards,

just recently I designed a dialog box with formatted
box-texts in them. Those text boxes are not editable - I use
them for output only.

When the data is displayed I want the user to press one
of the buttons on the box. So I call form_dial(tree, 0).

This is when something strange happens. Although I called
form_dial with '0' as a second argument (no start item) a
text cursor also appears in one of the text boxes. It reacts
to the cursor keys, ESC, DEL and BS. Fortunately the missing
EDITABLE flag prohibits any real changes by the user, but still
the cursor is annoying.

Does anyone know how to get rid of this text cursor? Do I have
to program my own form_dial() ?

Regards

Gernot

There has been quite a discussion on GEnie in Jim Allen's Fast Technology Turbo16 Topic about just this subject. It seems that when Jim Allen came out with the T16 various Blitters would fail at the higher speed. so, for some Megas, you have to replace the Blitter. You should contact Jim Allen at Fast Technology, or d/l the T16 Topic from GEnie.

Anyway, the tiny pc board attached to the 68000 cpu on SOME Megas to correct a timing problem with some Blitters. It seems that Atari has more than one source of the Blitters, and not all have the same timing characteristics. So, some Megas have the little board to correct this. Again, I got this info from Jim Allen of Fast Technology.

I would recommend that you get a GEnie account and contact Jim Allen there. Jim is probably the most knowledgable hw hacker for the ST outside of the engineers at Atari Corp.

I hope this helps someone out there.

P.S. I am a happy T16 owner myself. Jim has been a great support getting my Mega ST working with his T16. Thanks Jim!

Chill out folks, not to worry.
I'd be skeptical of the thing working anyway. Assuming that the 'FREE MAC' is legally using Mac ROMs, it'd be an expensive project. Just trace the history of Magic Sac and Spectre. Not only will there have to be hardware development but also software driver development.
And, as was earlier mentioned, the Magic Sac can be had for as cheap as $40.00. That would be a difficult product to beat for the price and it can do a lot of good things as long as 128k roms are not required for a particular application.
As it is, I've the Spectre GCR and think it is worth the funds that I saved up for to buy it. For that money, I've gotten a professional product that WORKS, and support from Dave Small that makes me wish that he was in charge of Atari corp, shaping product development, but even more importantly, CUSTOMER/DEVELOPER RELATIONS. But, I'll stop. I could spend pages of typing in my defense and praise of David Small. If he and Fast Technologies were to team up and build their own computer, I'd buy it in a second.

In manual (or in readme-file) it says that FORM needs 1M RAM and a HD
(not sure about that; I just feel I read it from somewhear). But I think
you should be able to use it at lest for small problems with SS floppy
disk and 1M memory. I have used FORM 1 (one!) day with my 1M 520ST and
a HD. It works really fine!!! I think FORM is one of the best programs
I have for my ST.

Hope this helps a little...

3466. LaserPrinters and the ST

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 16:10:26 UTC
From: covertr@force.UUCP
Message-ID: <4725e878.14a1f@force.UUCP>
Source record: 246438

Well, I have finally done it. I sold my Atari SLM804 laser printer. As you all know by now, I have spent the last 20 months trying to get decent support from Atari Corp for their product. I couldn't even get Atari to fix their buggy Diablo 630 Emulator, much less release the Epson Emulator for the SLM804. There has been a German Epson Emulator called LaserBrain, which I got a copy of over a year ago with German docs (which I can't read). but, Atari USA has yet to release an American version of LaserBrain.

And then there is the problem of using the SLM804 with Spectre/GCR. It seems that Dave Small does have a 144 dpi printer driver for the SLM804, but not a 300 dpi printer driver. So, even with a Spectre and a SLM804, I can't get decent print outs. To do so would require spending another $500 for UltraScript. I wish Dave Small could bundle UltraScript with his products. Maybe that would lower the price of UltraScript to something affordable by more people. What say Dave, could you talk to the fine Imagen folks about bundling UltraScript with the GCR??

Anyway, as I really want to use Spectre/GCR, and as I would like to get a HW PC Emulator one day, I need a printer that is more adaptable than the SLM804. So, I have narrowed my choice down to two laser printers, the new Hewlett-Packard LaserJet IIp (IIp) and the Panasonic 4450. Both printers have serial and Centronics parallel interfaces.

The IIP is the cheaper of the two lps. I can buy it locally for $995, but need to add an additional 1 meg board which costs $200 (third vendor board, the HP memory board costs $400). So, for $1200 + ~$100 sales tax I can get the IIp. The problem with the IIp is that it is slow, at about 4 pages per minute (4 ppm), and it lacks Epson emulation. So, while the IIp is cheaper than the Panasonic it lacks some necessary features.

The Panasonic 4450 lists for $2500 but the street price locally is about $1600. I can buy the 4450 from a mail order place in chicago for $1269, add another $230 for the necessary additional 1 meg of RAM and you are at $1500. And since it is mail order I don't have to pay sales tax. The 4450 is 11 ppm, which is faster than the slm804. The 4450 has builtin Epson fx-286e, panasonic 1092i, diablo 630, ibm proprinter, and Laserjet+ emulation. This should allow most, if not all, software to print on it. The 4450 also has dual 250 sheet trays, with optional envelope and other size trays. The 4450 has optional font cartridges, and I believe a PostScript cartridge (though that isn't needed with the availability of UltraScript now). The 4450's toner cartridge is $35 and is rated at 5,000 sheets.

So, all in all, the Panasonic 4450 is the laser printer that I will probably buy.

The purpose of this message is twofold. First, I would like to hear from anyone who has the 4450 printer. what are your feelings about it? Has it worked well with your ST?? Has it worked well with Spectre/GCR?? Would you buy it again?

And secondly, this message points out that Atari users have more choices now than a year ago. The local price of the SLM804 is $1200 w/o UltraScript, and $1500 with UltraScript. Compare that price to the local price of $1200 for the 1.5 meg version of the HP IIp, or the $1800 local price of the 1.5 meg version of the Panasonic 4450 and you see that Atari has some stiff competition in the laser printer area. Also, both Hewlett-packard and Panasonic have a better reputation, at least to me, for QUALITY and SUPPORT than Atari does. I can buy the 4450 and immediately use it with more ST and Mac programs than the Atari SLM804. I still can't use programs like AwardMaker or Certificate Maker with my SLM804 since those programs require an Epson printer.

Anyway, the net (pun intended :-))result of this is

NO MORE SLM804 GRIPES FROM RICHARD COVERT

on usenet or anywhere else!!!

Rich,

I think the strongest thing you can do to get new members is to recruit through the local dealers. That's the place that you are going to reach new and existing ST users.

I would print up cards, posters etc. and see if I could get them in all of the atari stores in town and in any neighboring towns.

Make sure that your posters mention the BBS.
After you get some members, I would talk to one of your local dealers and Atari about maybe having a guest lecturer come in and do a presentation. Maybe you could hold it at one of the stores. This is a fairly common practice in music stores. Anyway, if you can get some sort of presentation happening then Advertise that one event in the paper. Maybe throw a party and advertis in the science section of the paper for the party to recruit people.

I don't belong to any users groups but these are just ideas that occurred to me.
Hope this helps,

```

3468. Where to find software (was Re: "kneecapping" and TOS piracy)

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 16:24:12 UTC
From: steve@thelake.UUCP
Message-ID: <10308910241226l9@thelake.UUCP>
Source record: 246440

In article <1349@uvm-gen.UUCP>,
pegram@uvm-gen.UUCP (pegram r) writes ...
> ... We can do little about those things, but
>isn't there something we can do to turn around the small and
>shrinking (at least in the U.S.A.) applications software base?
>I can't find software titles that were out years ago, e.g. some
>compilers, an on-the-fly keyboard macro program, an outliner-word
>processor like More on the Mac (all there ever was was Hippo Concept),

Doesn't Word Writer ST have a built-in outliner? (I don't use it.)
Todd Burkey's free, portable FoldEd also works as an outline processor.

>and new ones are not out there replacing them. If this doesn't
>change soon I may be forced to go to permanent emulation (haven't
>done it at all - yet ;-}). Constructive suggestions desired.

I don't think "small and shrinking" is an accurate description of the
software base.

Access to the software base, however, is another matter. Atari's (IMHO
ill-considered) anti-mail-order policies have driven most of the
mail-order firms to simply kiss off the Atari line. Without mail-order
access, you're stuck with local dealers. And local dealers of ANY
persuasion are notoriously unstable, undercapitalized, understocked and
underinformed.

One access tool you should know about is the E. Arthur Brown catalog.

Eben Brown is not an Atari hardware dealer, but rather an software dealer
specializing in the Atari ST. The catalog is a 16-page tabloid newspaper,
composed with PageStream, that features hundreds of items for the ST (and a
few for the Amiga and IBM-PC, too). Eben has a knack for picking up
closeouts, so once in awhile you'll see some VERY aggressive prices. He
doesn't carry everything under the sun, but he does have an interesting
assortment.

Here are some items from the latest catalog (No. 24), which I received
last week. All prices are U.S. dollars.

Tweety Board (stereo for the ST) $24.95
IMG scanner (1000dpi, mounts on your printer) $64.95
Z-RAM 2-4mb upgrade (no chips) $129.95
Tempus II $47.95
PageStream 1.8 $119.95
Fleet Street 3.1 WITH ULTRASCRIPT $179.96
Calamus $189.95
Calamus Font Editor $64.95

Spectre GCR $249.95
--Mac ROMs $129.95
Universal Item Selector III $19.95
GFA Basic 3.0 with compiler $99.95

One of the more interesting items I noticed is SGS Net, a low-cost networking package that uses MIDI and coax cabling to connect up to 32 STs. A two-computer hookup (server and one node) is $149.95; additional nodes are $99.95 including hardware and software. I saw this at a dealer a month or so ago and flipped through the manual, which I noticed had code examples for developing network applications.

Some of the oddball items I saw included a stock market-tracking package, programs to generate crossword puzzles and word jumbles, and even a needlework pattern creator (you paint the needlework on the screen with your mouse and the program prints out a counted cross-stitch pattern).

The catalog includes the usual assortment of games and books, too, plus the Current Notes public-domain/shareware disks ($4 each plus shipping).

To get the catalog, call (612) 762-8847 or write:
E. Arthur Brown Co.
3404 Pawnee Drive
Alexandria, MN 56308

Disclaimer: I have no affiliation with the above company. I have ordered items from them and found their service to be prompt, efficient and courteous. (This is generally true of Minnesota people. It's too cold to be antisocial.) I do not know their policies on shipping out of the United States.

From: clubok@husc4.HARVARD.EDU
Message-ID: <3298@husc6.harvard.edu>
Source record: 246441

Hi, folks. I recently got OPUS, which seems to be a really great spreadsheet (especially for shareware). However, I have a problem with charting. The manual says that one should have the necessary files if one has a GDOS application, but try as I might, I cannot find META.SYS on my original Wordup disks or anywhere else. If it is legal, could someone please send me META.SYS? If it is not legal, or you have some other response, please send me e-mail; Try as I might, I just can't keep up with this group. (Thanks to the high volume of slush :}) Thanks in advance.

> BUT: The included ICDFMT.DAT file says Version 3.00 and lists only "d" type >entries, ie. only disk drives, no more controllers, such as for my Maxtor.
The following is from ICD's READ.ME file -
In brief, here are a few things you SHOULD know about this software:

o This current release includes full support for Omti 3520/3527(a) SCSI controllers and drives connected to them, most embedded SCSI drives, and support for Adaptec 4000(a)/4070 SCSI controllers (only high level defect mapping is supported with Adaptecs). SASI controllers are no longer supported. Use our older version software for use with SASI or else purchase a new Omti controller. It will be much faster than SASI.

Sounds like you can't use ICDs V4 software with anything but OMTI, ADAPTEC, and embedded SCSI drives.

In article <1824@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
[A description of some of the video nifties in the 1040STe.]
[Later KBAD discusses some of the differences between the STe and TT
video nifties.]

This has probably already been asked & answered here, but...

The STe appears to be the first "ST" that offers fundamental hardware
improvements that software can take advantage of. The TT, of course,
is another beast altogether, although it will apparently be backwards
compatible with "ST software".

Obviously no one in their right mind will write STe software that isn't
downwardly compatible to the existing STs (for awhile yet, anyway -- I
HOPE!!). But it'd sure be nice to use the STe's video nifties when
present. Is there an approved method for software to discover what
platform it's running on, other than (KLUDGE ALERT!) checking the TOS
revision #?

Please tell me it IS so! (And also what it is! ;-)

3472. A LEGAL Mac emulator!

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 18:54:38 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1989Nov30.185438.6755@sun.soe.clarkson.edu>
Source record: 246444

I want a mac emulator for my ST that is 100 percent legal.
Is this too much to ask? Isn't this the "moral" thing to do?
Isn't this what everyone is trying to do?

I priced the most inexpensive LEGAL mac emulator I could find, please tell
me if there is a more inexpensive way to go:

Spectre 128... $129.95 (retail)

(Now the 128k roms, which can only be
LEGALLY attained from Apple Computer Inc.)

(AND the System and Finder software that
ARE ALSO COPYRIGHTED BY Apple Computer
Inc. for use exclusively on Macs)

(Apple has a nice little package that includes
the 128k roms, and the System software,
PLUS they throw in a Mac Plus for free!
[minus roms and System software]) Mac Plus package... $909 (edu. price)

$1038.95 (LEGAL?)

This is of course excluding the price of the St to run it on.

Doesn't anyone realize this?

Totally "tongue in cheek"...

3474. What Kermit/UNITERM bugs?

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 19:26:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8912010813.AA04349@ucbvax.Berkeley.EDU>
Source record: 246446

One netter mentioned problems with UNITERM's Kermit. On our site, which has a CYBER 830/990 combo and various VAXs, such as an 8550, the only Kermit that works flawlessly with full server support is UNITERM's Kermit. Some 20 - 40 people use it almost daily. I use UNITERM Kermit in text or binary mode almost every day and I have never had one problem. I've tried Versa-Term Pro and Red Ryder under Mac emulation but they do not have server support. Neither does ZSTEM or SmarTerm 240 for the PCs. The ONLY Kermit I trust is UNITERM's so WHAT problems are there?

> yesterday I got a version of the TOS 1.4 as a disk version.

The rest of your message doesn't matter.

DO NOT USE DISK VERSIONS OF TOS 1.4 ANY MORE.

If you experience the same problem with a ROM (EPROM) version of TOS 1.4, then you can start blaming it on the application or TOS. Not until then. The disk-based version was for developers to get a taste of TOS 1.4 early, and IT IS NOT A PRODUCT SUPPORTED BY ATARI.

Message-ID: <252@watserv1.waterloo.edu>
Source record: 246449

In article <4725e878.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Covert) writes:
>Well, I have finally done it. I sold my Atari SLM804 laser printer.

Probably a god move.
>The Panasonic 4450 lists for $2500 but the street price locally is about $1600.
>I can buy the 4450 from a mail order place in chicago for $1269, add another
>$230 for the necessary additional 1 meg of RAM and you are at $1500. And since
>it is mail order I don't have to pay sales tax.

I have a 4450 as well (LP1100). The price has come down since I bought
mine (in Canada). More detail follows...
>The 4450 is 11 ppm, which is faster

Since I don't do much straight text dumps, this speed isn't noticable
to me. I mainly do bitmap dumps from TeX or Calamus. It takes about 5min
per page for Calamus to process a page and about 2min per page for TeX. When
I do do a text dump (from a PC and WordPerfect) the printer flies!

>The 4450 has builtin Epson fx-286e, panasonic 1092i, diablo 630,
>ibm proprinter, and Laserjet+ emulation. This should allow most, if not all,
>software to print on it. The 4450 also has dual 250 sheet trays, with optional

The emulations are very complete as well. I have no incompatiblilty
probelms.

>The 4450 also has dual 250 sheet trays, with optional
>envelope and other size trays. The 4450 has optional font cartridges, and I
>believe a PostScript cartridge (though that isn't needed with the availability
>of UltraScript now). The 4450's toner cartridge is $35 and is rated at 5,000

Those two 250 sheet trays come in handy! You can also set the
printer up to switch from one tray to the other when one runs out of paper.
It'll also do duplex printing without a jam, but you have to be fast!

>The 4450's toner cartridge is $35 and is rated at 5,000
>sheets.

Well... there isn't a toner cartridge. You fill the 4450 like a
photocopier (there is a little dorr under the paper tray). The consumables
are: toner, $75/shot 5000 pages; drum, $250/shot 20,000pages; and
developer, $170/shot 13,000 pages. I worked this out to be about 4 cents
per page (cheap!).
>
>So, all in all, the Panasonic 4450 is the laser printer that I will probably
>buy.

I don' think you'll be disappointed.

Also, the 4450 is built tough! The design is great! there is
one-touch access to the complete paper path and cleaning is easy.

3478. Absoft Fortran

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 20:14:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8912010814.AA04387@ucbvax.Berkeley.EDU>
Source record: 246450

I understand your problem with the Absoft Librarian.

A collegue of mine has persuaded me to try Prospero Fortran because it supports libraries from mixed languages. Prospero C and Prospero Pascal routines are supposedly easy to incorporate into Prospero Fortran executables. The GEM bindings for Prospero Fortran also appear to be much cleaner than those for Absoft. Given these factors and an absence of support for the ST from Absoft, my next programming venture will use Prospero rather than Absoft.

I don't know whether you have invesigated Prospero Fortran or not. If anyone has had contrary experience I would hope that they would speak up.

Could you please describe Erlgraph? I am keenly interested in a good FORTRAN graphics package and I might be willing to help with development and/or testing.

This is being posted openly rather than as direct mail to see if it smokes anyone out of the woodwork.

3479. Degas > PS and DVI > PS

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 20:16:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8912010814.AA04390@ucbvax.Berkeley.EDU>
Source record: 246351

Degas to Postscript:

I handle this problem on a regular basis using the following tools:

1). Import the Degas picture into TOUCHUP and get rid of the jaggies. This step is needed for images that are to appear large on the final page. It is not needed for small things like logos. The procedure generally works only for line art. I have not yet tried it with DEGAS pictures derived from continous tone sources (VIDI ST or Computereyes).

2). Save the result as an .IMG file.

3). Import it into Timeworks' Publisher ST. This must be installed using The Postscript option. PageStream may also work, but I am not sure of this.

4). Print the file as Postscript. Publisher ST saves the result as a disk file containing Postscript commands.

5). Image it out using an SLM804 with Ultrascript. It may be possible to print the file using a printer with built-in postscript. I have just never tried this option.

This is admittedly a high-priced solution, but not outrageously so. I certainly get the job done more quickly than if I tried to mess around with writing my own code for this.

It should also be noted that PicTeX is another way to get hardcopy from an image file. Since this is an open software environment it should not be too difficult to write a program to convert Degas to PicTeX.

PicTeX is available on the Current Notes TeX distribution kit.

While we are on this subject I would like to respond to Dylan Yolles on the matter of TeX DVI to Postscript conversion. With my imperfect knowledge of the subject it appeasr that such a conversion would not make sense. The font files used to generate the DVI document in TeX do not correspond in any sense to those used in Postscript. It is therefore unreasonable to expect that the layout of the document would be preserved in such a conversion.

The basic function of a DVI***.TTP program is to bit map the text for output to a device that supports some sort of raster. Even if we assumed that a psosctript printer could be trained to do this it would seem like horribly inefficient use of postscript.

My experience in beta-testing the TeX distribution put together by Horace MItchell for Current Notes is that it is best to stay in the TeX

environment once you are in it. The SLM804 is an outstanding output device and the software runs with satisfying speed on a 1 meg or larger Atari ST. We currently lack a DVI driver for a 24 pin printer, which would make TeX much more affordable and accessible.

I am not sure what Dyllan's application is, but if he would care to share it with us maybe we can find another way to solve his problem.

One final thought: Maybe the TeX for the Macintosh would run under Spectre GCR and produce Postscript output. Has anyone tried this?

>than the slm804.

Of course, this is just the physical speed. In applications where you are sending full-page graphics to the laser printer, the SLM804 will win hands down because of high transfer rate between the ST and the printer.

Just like CPUs, you have to benchmark the printers printing the kind of stuff you print before you know their relative speeds.

When I was searching for the ROMS, I did call an authorized Apple dealer
and
they would sell me ROMs. This might depend on the dealer though.

> (AND the System and Finder software that
> ARE ALSO COPYRIGHTED BY Apple Computer
> Inc. for use exclusively on Macs)

You can go into any Apple dealer and purchase the latest system software
for
around USD$45.

> (Apple has a nice little package that includes
> the 128k roms, and the System software,
> PLUS they throw in a Mac Plus for free!
> [minus roms and System software]) Mac Plus package... $909 (edu.
price)

Not everyone has access to the educational discount. Also take note that
you get to use the discount ONCE, that's it (you also can't sell it for a
period of time thereafter either.) Also, each university is on a different
price reduction level depending on Mac use. Brown is at the highest level,
but some other college may have to offer it for several hundred more. Since
you would use your one time discount, you'd probably also buy an
Imagewriter
and (/or only if you're a masochist) a hard drive. Then add that all to
the
cost of the discounted Mac. I would certainly use my one time discount to
choose a set that I would be able to use for a long time (like one from the
Mac II line but then, that's me).

If Apple really thought that places that sell used HD (and therefore ROMS)
were illegal, I doubt that you would see those places still around. For
example, say a person has a dead Plus that they want to sell. Joe's Used
Macs buys it and then proceeds to gut the dead Plus and sell its parts.
That's probably still legal, hence we are able to get ROMS.

Don't forget that the Plus has a very short life span left as new apple
product. It won't be much time before the SE is bottom of the line and
that's around $1400-2000USD with the edu discount! (Add HD and its crazy).

I won't even get into want "constitutes" a Mac. ROMS? Apple logo? Chips?

I hope this makes everyone feel a bit more legit.

3484. Re: Craft & TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-11-30 22:47:41 UTC
From: alleyne@phoenix.Princeton.EDU
Message-ID: <11842@phoenix.Princeton.EDU>
Source record: 246356

I tried posting this once from my site already but there seems to be something wrong with our news program, as I can't read it from this site.

NOTE: This message is from depeche@calvin.cs.mcgill.ca; please do not reply to this address.

I just upgraded my 1040ST to tos 1.4. I really like the speedup of the hard disk but there are a few questions I have about it.

1] When I format a disk from the desktop, nomatter what disk or what drive I am using, I get 'bad disk' errors when it nears track 79 or so. These disks format and work fine if I use Neodesk,. Anyone else have simmilar problems?

2] I used to use PQ.PRG, a background print buffer by Wayne S. Arczyinski, but this no longer works on tos 1.4. I sent mail to him asking about new versions but haven't gotten a reply from him yet. Does anyone know of a program whic does the same basic thing but also works on tos 1.4? Spool11.Tos will not do as it is much too slow for my printer. I need one very urgently!!

3] I have a supra 30mb hard disk which at the moment is setup to autoboot. When I had tos 1.0 and if I wanted to disable autoboot for one session (i.e. to play games) I held ctrl-alt-lshift and the floppy would boot instead of the hard disk. This doesn't work on tos 1.4. Does anyone know how I can remedy this? (At the moment I have to unplug the DMA cord whenever I want to boot directly from floppy).

any and all help would be appreciated, and my sincere apologies if my previous messages did get posted to your site and this is the third time you are seeing them, but I want to make sure...

>
>Could Atari not make a pin compatible MMU chip that could replace the normal
>one in the ST and give us all word alligned and segmented video RAM just like
>the STE.

This sounds good. Ahhhh, I remember back to my 8-bit 800XL days (I've still got it!!!). Such lovely things like smooth scrolling, display lists and DLIs... And of course, sprites (oh, sorry, player-missile graphics :-)).

>From looking at the circuitry I don't see how these features would require
>any pinout changes. Delaying the scan and adding the extra colours to SHIFTER
>would be another matter.

The problem with this I can see is that then, rather than people having to write software for two types of Atari, they would now be faced with three. Games software would like to take advantage of the new STE modes, but a half decent game would probably try to do a half decent job on an old ST.

I think the STE is a very good idea. I'd like a 68000 Atari to perform as well as a 6502 Atari, although if you scale everything up you still end up with a machine that is less than it ought to be.

Here's something for the guys at Atari:

Post the hardware specs of all Atari products (ie memory maps and programming information) to the net. I don't want developer support. I can't afford to buy the developer's kit. Nowadays some of the best games (and lets face it, hardware scrolling, etc *is* for games), are written by enthusiasts at home. Give these people the opportunity to harness the power of the machines you produce. The more information that is public domain, the more people can program your systems, the more software is written, the larger the software base, the more computers you sell, etc.

Come on Atari, what have you got to lose?

Oh yes, gimme TOS 1.4 uuencoded, on the net, suitable for burning into EPROM. Why not? It's free (isn't it?).

All this "give me this", "give me that", you may wonder what you get in return. Well, you get USER SUPPORT. You be nice to us and we'll like you for it.

Dave.

I am glad this discussion has surfaced.

I just printed out a short score - 3 parts/148 measures - on my dealer's slm804. Took about 7 minutes - 7 pages. The same score takes 45+ minutes on my Epson LQ-800 . I am deliberating over getting the ATARI.. or the Panasonic 4450. Unfortunately, i have yet to see NOTATOR's performance on the Panasonic. If what Greg is saying is true... the ATARI, for my purposes, would be better.. as most of my printing time is consumed by graphics. However, the Panasonic seems to be a "better" system. Wish i could have both!

AN advantage to buying the Panasonic is that it may be used with lots of other systems.... if one ever decides ST's no longer cut it.

Has anybody out there seen/used NOTATOR with the 4450?

Incidentally, i had a lengthy discussion with the rep from NOTATOR today. Great guy.. lots of information about NOTATOR's future... Particularly relating to the TT. C-LAB has had 2 TT's on order for over 10 months. THey are now told it will only be 30-60 days before they get one. Now if developers don't even have the TT yet (and mind you, C-LAB is out of GERMANY!) we'll all be out of breath before the general public ever sees one.

Oh yeah.. there are rumours that NOTATOR is being ported to the MAC. Ain't so.

3488. Soz C V1.2 Upgrade help required

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 00:23:57 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <8912010805.AA03513@ucbvax.Berkeley.EDU>
Source record: 246360

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Dear Netters,

Being a beginning C programmer, I have managed to coax my copy of Sozobon Version 1.01 to compile, link and all that sort of stuff on single files. However I have not used anything other than the supplied CC utility, to drive all the other elements (hcc and top etc) and especially I haven't yet managed to get 'make' to work. This has slowed to a total halt my efforts to compile up the version 1.2 of Sozobon (supplied in source format only :-(

I have tried to use the make facility on the supplied files. I had my normal Soz C work disk in the A drive and the 1.2 source in a ram disk, installed as drive d:. I then made the source files the active window and ran the make utility by selecting it using the right-left double click technique and then selecting open from the desktop. But it still didn't work.

I would be mega obliged if someone could take the time to explain where I went wrong, so that I can actually perform the upgrade. I have no objections to anyone calling me a wally for getting something obvious wrong, but as far as C is concerned I have to ask these questions! :-)

I do have a copy of the Gulam shell, but I haven't used it very much yet. However I will dig it out and blow the dust off it if necessary.

Many thanks in advance

TMRF

PS To the authors of Sozobon, I read your request for news of anyone who was using your software. Well ... I'm trying to do my final year project in it, so I guess that I count as a user (perhaps a developer!?) of your product.

In article <4123@eagle.wesleyan.edu> jtreworgy@eagle.wesleyan.edu writes:

|The thing with a Mac emulator is that no matter what, you have to spend $140 on
|the ROMs. So what does it matter if you spend $20 for a shareware one or a bit
|more for a commercial one? The shareware one probably wouldn't "sell" anyway.
|It just seems silly for a lot of different people to invest a lot of time
|making a Mac emulator when the product already has several incarnations on the
|market. The time would be better spent making a Commodore 64 emulator, for
|example. (And some way to pipeline the ROMs out of a real 64... enough people
|own these anyway such that it wouldn't be illegal or unfeasible for each buyer
|to get them legally that way).

|--
|James A. Treworgy -- No quote here for insurance reasons --
|jtreworgy@eagle.wesleyan.edu jtreworgy%eagle@WESLEYAN.BITNET

Wait. GBS gets something like $300+ for the GCR. I think that the "plain"
version is > $100.00 (usd)

THIS DOES NOT INCLUDE THE ROMS

Thus, if my math is correct:

Shareware GBS
Hw/Sw $20.00 vs $100.00
Roms $140.00 (same) $140.00
------ ------
Total
$160.00 vs $240.00

This makes it MUCH more affordable. Heck, I could be convinced to buy one for
that price. $80.00 is more than "a bit more"

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Dear Netters (again),

Does anyone out there feel so disposed as to explain to a poor unfortunate
about environment variables?

1 What are they?
2 Where are they stored?
3 What are the standard ones? (I've heard of PATH)
4 How do I use them from C (Sozobon in particular!)
5 How do I pass them to other programs?

I'm learning slowly but surely, but haven't yet come across this information!
May I also say that the technical articles that arrive in my mail box, through
this group are very benificial and that I have learnt much. However the flames
are just getting on my nerves! I seem to remember buying my ST for what it
could do at that exact instance when I handed over my hard earned cash, not
because I expected Atari to issue loads of wonderful add-ons (such as an
'Atari to PC missile :-) but because it was cheap, powerful and most importantly
it had megs of software available at either reasonable or negligable prices
(as well as all that scrummy p.d. and freeware!!).

Thanks in advance,

TMRF (Getting down off soapbox now! :-)

Rich Covert asks for suggestions on how to increase their club membership. Here's my 2 cent suggestion. Since you seem to have a good relationship with your dealer(s), why not convince them to give you a list of costumers who have bought ST or ST software from them. Send these guys a flyer about your club and why they should join. This is the cheapest approach with the highest chance of success.

3493. Xformer II (or whatever)

3499. ST DRIVE AND SPECTRE/TRANSLATOR 1

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 01:46:29 UTC
From: MAXG@SUVM.ACS.SYR.EDU
Message-ID: <8912010818.AA04765@ucbvax.Berkeley.EDU>
Source record: 246371

Everybody (or almost everybody) out there knows by now that not all ST drives are able to read a Mac disk when running Spectre or Magic Sac with the Translator 1 (or SpectreGCR). Well I had one of those disk drives...it is a Sankyo (at least that is what it says on it) and was converted from an IBM drive to an ST drive by its previous owner. I bought it before I got my Translator and so I was disappointed to find out that it was one of "those" drives. Well, I have struggled (if you can call it that) with only one drive that reads mac disks by booting in the good drive and then ejecting my system disk and putting it into "the other" drive so that I could put my mac disk into the good one (Yes, I could have changed a and b drives, but "the other" drive is awfully loud...I like it as the b drive). Well, I am writing this to encourage those of you out there who have one of these "other" drives, because for some totally unknown reason, the other day I put a mac disk into this "other" drive...and the drive read the disk! I couldn't believe it, but that drive now recognizes mac disks via the Translator1....I have absolutely no idea why...everything is the same as before, but now the drive works! (I hope this doesn't mean that the drive is "on its way out".)
So, for those of you out there with one of "those" drives...try it with the mac disk from time to time....maybe it'll work some day.

...
#>1) In order not to violate Apple's copyrights, ROMS must be made available
#>for this guy by way of a cartridge.
[or some other similar mechanism for legal reasons... see below]

...
#>2) In fairness to David Small and as an obvious business move, don't make
#the cartridge steal his thunder.
[by which I mean it is not a good idea to set out in such a way as to
ENCOURAGE ripping him OR ANY ONE ELSE OFF. At the outset, design to allow the
shareware system to stand separate, and not result in the shareware cartridge
being used with HIS software. If you want to write your software to work on
your cartridge and his, more power to you. If you want his software to work
on your cartridge, you are just pirating cartridge designs, and should not
expect to get ANY money for your software.]

...
#>3) Comparing David Small to Lotus is laughably self-serving, the kind of
#>defense that pirates sometimes make: "No one gets hurt, only some big
#>business..."
...

I cannot believe I am reading this. The hidden suppositions in this way
#of thinking are truly amazing:
#
#1. DAVID SMALL IS A SMALL BUSINESSMAN AND THEREFORE DESERVES SPECIAL PROTECTION.

Wrong. The real suppositions are:

A) Businesses deserve (and have) legal protection for their products.
B) The Atari market is small, and tends to attract small businesses at best.
C) It is easier to damage and discourage small businesses than large ones.
D) Equating a small business with a large one as a ethical moralization for
predatory behavior is specious.

Some conclusions that derive from these are:

If a product for the Atari market is designed in such a way as to encourage
ripping off ANY business, big or small, which contributes to the success of
that market, it is NOT a good idea and is not in the interests of the market
(and hence the product itself).

The only way that "small" enters the picture is that a small business is less
able to afford to defend itself against predatory behavior.

I used the Discovery cartridge as an example of a bad idea: you could (reportedly) pop in Mac ROMs and pirate a copy of Small's work and have a Mac clone without paying him for his cartridge and software package.
PLEASE NOTE : I DO NOT OBJECT TO COMPETITION. If the same cartridge were available with its own Mac emulation software, I wouldn't have any objection, provided it did not encourage piracy. The easiest way to accomplish that is to make sure Dave Small's software DID not work with the other cartridge, since his software goes to some pains to make sure it IS using one of his cartridges.

#2. DAVID SMALL IS A GENIUS WHO MAY FAIL IF HE FACES COMPETITION.

Sorry. This assumption does not enter into it. Flooding the small market with a cheap hardware cartridge work-a-like that can use his software once pirated doesn't rate being called "competition". ANYONE, genius or not, will fail in the face of being ripped off enough. Remember, I AM NOT OPPOSED TO FAIR COMPETITION AS I OUTLINED ABOVE. That is why I take issue with this being a "hidden assumption".

#3. SHAREWARE IS NOT OK IF IT DUPLICATES SMALL BUSINESSPERSON'S SOFTWARE.

Again, this is not an assumption at all. Whether a product is shareware, freeware, or commercial, I have no objections to fair and healthy competition. Just as I object to the commercial Discovery cartridge feature I indicated, I pointed out the objections to similar "features" of the shareware cartridge. That does not preclude the product, it just puts parameters on what I consider to be a viable design.

Hmmm. I wonder what shareware/freeware you own that you could have
#paid for, that could have supported a small businessperson? You may very well
#be consistent in this philosophy, but I guarantee most other people aren't.
You using Uniterm, for instance? Gulam?

No, I use Flash and Mark Williams' msh. I certainly don't object to Uniterm: I think it is a great program. Likewise with Gulam. I just happen to have other programs that I find more convenient to use. As should surprise no one, they are all legal copies. I don't pirate software. As for shareware, at the recent World of Atari in Dallas, I spent over $100 dollars for shareware direct from the developers, including some that I already had (but did not use since I hadn't registered for it yet). Sigh. Sometimes being honest is inconvenient.

#... Are you against shareware/freeware as a concept? If it duplicates
#anything a profession group has done, it is going to hurt someone "small"
#(as opposed to big, not "David" :^)) somewhere down the line...

As I just indicated, I believe in shareware/freeware as a viable competitor to commercial concerns. I ONLY take issue with unethical application of the concept. If I PERSONALLY had a Mac emulator that worked off of a cartridge that would not support Dave Small's software, I PERSONALLY would NOT release it as shareware. I MIGHT release it as a commercial product if I thought the return would be adequate for my trouble. (Which it might not: Dave would be very hard to compete fairly against, and I PERSONALLY have not other way to compete.)

#4. UNSUPPORTED SHAREWARE WILL BE SNAPPED UP IN PREFERENCE TO SUPPORTED
#PROFESSIONAL SOFTWARE.

OOPS. You seem to have read one of my assumptions backwards. I actually assume that UNSUPPORTED PROFESSIONAL PIRATED SOFTWARE WILL BE SNAPPED UP IN PREFERENCE TO AN INFERIOR SHAREWARE PRODUCT. That is the whole point to not stealing Dave Small's thunder: it is the ONLY way to keep the shareware aspect viable. Otherwise, it will just be an aid to pirates.

#5. IF DAVID GETS BURNED BY SHAREWARE, HE WILL MOVE ON TO SOMEWHERE ELSE.

The way I would put it would be:
IF DAVID GETS BURNED, HE WILL MOVE ON TO SOMEWHERE ELSE.

Shareware has nothing to do with it. He could be driven out by legitimate competition from a shareware product such as I outlined, and I would have no ethical objection. I DO object to people being ripped off. And we'd all miss him :-).

#6. THIS OTHER GUY IS NOT WORTHY OF CONSIDERATION.
#
I may misremember this mail, but what I recall is that both these
#products were developed independently, and found different market niches
#(American vs. Europe). This other guy (I wish I knew his name! I'm not
#intentionally being insulting) got stomped on by Apple, and was put out of
#business. David has not been stomped on by Apple...yet. This other guy may
#very well be in the same league as Dave, but "nipped in the bud". Why does
#this make Dave more worthy of support?

According to press reports, the Aladin system included illegal copies of the Macintosh ROMs, and Apple shot the product down. The developers have every right to convert their work into a legal product which Apple has no way to affect. DAVID SMALL HAD TO DO THIS! Early versions of the Magic Sac project were altered so that only legal Mac ROMs could be used, and the ROMs must be physically present (not illegally copied on disk, or whatever). He WAS stomped on by Apple. THAT is why he NOW has no trouble with Apple: he altered what might have been an illegal product into what is demonstrably legal. To me it makes more sense for the Aladin group to do likewise and to keep the product commercial, than to convert the system to just an illegal shareware system rather than an illegal product. I actually give them the benefit of the doubt by assuming that they will take the cartridge-and-ROM route to legality anyway, despite a lack of anu such indication : the mail suggested making Aladin more-or-less as-is shareware - which would certainly be illegal and upon which Apple would certainly stomp.

From an ethical standpoint, I WOULD support the effort of the Aladin group to produce a legal competitive product. But don't expect me to buy one unless it is superior, not merely cheaper: the competition beat them to me! (Scratch me as a market niche :-)

... However, I find this "David Small is a Ghod and we must do anything to
#keep him happy" philosophy repellent and, in a backwards sort of way,
#insulting to Dave. I respect him (not worship) and I believe he will do just
#fine, competition or no. You should, too.

I should stress that as a rabid monotheist I certainly do NOT consider David Small a "Ghod", nor do I "worship" him. I also think he will do fine in the face of competition, I just differ (or more correctly more strictly define) what I consider to be "competition" and what I consider to be "predatory behavior".

Incidentally, has anyone asked Dave how he feels about this
#competition? I bet he's not particularly worried...

From published reports, he WAS not pleased with the Discovery cartridge "feature", nor with the nature of Aladin's competition (since they used on-disk copies of the ROMs and he couldn't). Being a firm believer in a level playing field, I see his point of view.

#Robert

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.wanted

Have a 130xe (or two) that you don't use anymore? Sell them to me!

I'm looking for a number of 130xe computers. My offers are listed
below. If you have one for sale, please reply via one of the below
routes, or call me at (716)328-1703 before 11pm EST.

130xe with no power supply - $45
130xe with power supply, TV cable - $60
130xe with all cables, original box, packaging, manual - $75

XE must be in perfect working condition, no upgrades or the such. I
will pay for shipping (UPS ground). I only need 130xe computers, not
the 65xe or any XLs.

Thanks much!

In article <2165@cs-spool.calgary.UUCP> marc@cpsc.UCalgary.CA (Marc Schroeder) writes:
>I'd like to incorporate Kermit into my Flash152 term program.
>
> 1) Is this possible?

It's VERY EASY. Simply put the PD kermit.prg into the directory that FLASH
uses for default. To execute it use FLASH's 'ex' command.
Example 1: sending a file.
HIT INSERT KEY
TYPE: ex kermit.prg s myfile

Example 2: recieving a file
Hit the INSERT KEY
TYPE: ex kermit r

Kermit is a public domain program.

3505. Re: Help with Uniterm 2.0e

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 06:32:56 UTC
From: mark@rpp386.cactus.org
Message-ID: <17388@rpp386.cactus.org>
Source record: 246377

Aaron,
I have noticed problems with Uniterm 2.0e also. The only way to get unstuck from the dialer is to press and hold down Alternate-H until the program runs out of retries. The modem will freak out while this is happening, but it will accomplish the goal.

The problem is so frustrating that I don't use automatic redial when using Uniterm.

In article <1576@bnlux0.bnl.gov> atc@max.UUCP writes:
> Do you know of any vendors that make a timeclock cartridge
>for the 1040ST?

A company named QMI makes a cartridge called "DeskCart!". It includes
a clock and lots of desk accesorie software. The clock works fine, but the
software is not good and usually doesn't work. The software does have a
nice calendar function, which links to a scheduler. However, the automatic
alarms on the schedulernever seems to work properly.
I have DeskCart! and I have decided to just use the clock part of it.

Oh, DeskCart often costs around $70 (bought mine for aout $100).

3507. Re: How to get new members??

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 07:43:34 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24623@cup.portal.com>
Source record: 246379

Richard Covert asks about getting new members for Atari Users' Groups:

You've probably hit on the best way to contact new ST owners, by getting in touch with the dealers who are selling them. If you post flyers in the stores too, you can make the club known to people who already own STs as well...

One thing MACE has done (the Michigan Atari Computer Enthusiasts.. I'm the ST disk librarian this year, and I've been in various other offices in past years...), is to put together a disk of the "basic" few programs a new ST owner will need. Things like ST Writer, ARC, a simple terminal program, an easy to use database... things like that... with text files on how to use them, and an offer of help at the club meetings for new users. By having the dealer give a disk away with every ST sold, it gives the new owners a boost by supplying them with something to use their shiny new ST to run, and the dealers like to be able to give their customers something for free (especially when it doesn't cost them anything..!).

Of course, the disk also has information on when and where the club meets, and phone numbers for more information.

As far as meeting places, that's always a tough question. A few years ago, when MACE's membership stood at around 2000 members, we could fill a large civic center pavillion to capacity. Now we use a smaller room, and are looking for something smaller (and cheaper). One thing about the university meeting rooms to look into is whether the club could qualify as a school sponsored group if they have enough active students as members. The University of Michigan has a really good deal for their groups.

As far as Atari, I guess I better not comment about the screwing over that MACE received from Atari when we put on the AtariFest that Atari asked us to do. Those who were involved in that are gone now, and there's a new person in charge who is really good. Call Bob Brodie, the new User Group Coordinator and talk to him about how to register your club. As long as the "Atari Revolving Door" doesn't snag him, Atari User Groups are going to be very well treated.

3508. MWC DB-problems

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 08:02:01 UTC
From: HAHN_K@DMRHRZ11.BITNET
Message-ID: <8912010801.AA02743@ucbvax.Berkeley.EDU>
Source record: 246380

Finally I HAD to use MWC 3.0.6's debugging utility db in order to
examine a strange program. I started it and was only informed that
it doesn't know the 'tos version of 02061986' (or was it '06021986'?,
anyway, one of those...). So it decided to stop immediately. Allways.
No go. My ST is a 1986 german model, and I encountered no problems
like this one before.
What could I do ?
- Klaus.

3509. Re: ST TeX questions --> read the TeX book|

REF: Spectre and AppleTalk
I do not know what make it so difficult for Dave to make his Spectre works with AppleTalk. I am not a 'Software man' but I own Aladin Mac Emulator v.1.3e at th e same time which I have the MagicSac V.6.1. While the MagicSac did not work with many Modem programs except Red Ryder 7.0 and Freeterm V.1.xx due to the co nfliction with the serial chip in Atari, Aladin V.1.3e (which is a very old ver sion released in 1986) did not have this problems. Spectre from V.1.75 onward has solved the serial chip problem well. I don't understand why Dave can't do it. I recalled he did mentioned long back that he also own Aladin 1.3 too. Pooling or exchanging experience with Matias Greeves (Author of Aladin) may do all Atari users more good. I not sure how approachable he is but my friend talk to him via the long distance call tole me that he seem to be a very nice guy. BTW. I have tried Assync Apple Talk program with Spectre but fail because this program uses Mac printer port. Our Atari Printer port is Parallel. Regards.

Well I guess you folks knew I wouldn't let this go by without comment ...

In article <8911300808.AA08824@ucbvax.Berkeley.EDU> AMEIJ@vax.oxford.ac.UK
(Jan Ameij) writes:
>I now hear that Atari UK have ordered the TOS1.4 roms from Atari Taiwan, and
>that they will be available sometime (but, opinion seems, not soon) for a
>price well in excess of 100 quid (cf 100 dollars in the US!).

Yeah! That's sounds like regular 'screw them stoopid' Atari UK policy.
These ROMS will probably be for general distribution but why do I not have a
it (even on EPROM) now. We ARE registered Developers!

>I have also discovered that Atari UK are the worst company to contact that
>I have ever encountered, with a telephonist whose degree of unhelpfulness
>plumbs constantly lower depths. "Atari-please-hold..... (25 minutes later I
>gave up)". That's if they answer (50% chance). I can quite easily believe
>that this bunch of wazzocks are entirely responsible for the non-appearance
>of TOS 1.4 here.

My usual Atari UK telephone experience (if I get an answer)

Atari: "Hello Atareee!"
Irate Developer: "I'd like to speak to Bob Katz please"
Atari: "Hold on pleeez" Click
Silence, More Silence
Atari: "Who are you hold for?"
Irate Developer: "BOB KATZ"
Atari: "Hold on puleez" Click "I'm sorry he's in a meeting" (Like everyday!)
"Can I take a message"

At this point you can either say NO (But she'll hang up before you finish the
word) or YES and leave a message that will be ignored or she'll forget before
it hits the paper.

>Jan Ameij,
>Oxford University Department of Applied Metaphysics,
>ameij@ox.vax

Do you remember the joke about Apple employees changing a lightbulb?

How many Atari UK employees does it take to change a lightbulb?
Who cares as long as they change it soon! :-) NFSU

>PS: Ken B. and Allan P., please don't take offence, I realize this has nothing
>to do with you or Atari US.

Agreed! Thru these silent years they have been the only support I have seen and
long may they continue to do so.

Did somebody succeed in getting the famous Seagate 296N drive
to work with the host adapter of a SH204?
What was the transfer rate and was it possible to boot from the
harddisk? Which formatting software and HD driver was used ?
Thanks for any reply. Matthias Heiden

3516. TOS *.* ROMs

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 11:28:16 UTC
From: malcolm@tower-unix.city-poly.ac.UK
Message-ID: <25701.8912011128@unixa.clp.ac.uk>
Source record: 246388

Firstly, (sigh) the non-availability of TOS 1.4 in the UK: much as I'd like to join Neil Forsyth on the soapbox, I recognise that radical changes of policy take time (even assuming Atari UK can be persuaded to change at all!), so it might be better for us to look elsewhere. So, what's to stop me buying TOS 1.4 ROMs from the US, sussing out what changes need to be made for UK use, then blowing my own modified copy? Never having met a US ST I'm not sure what the differences are (beyond the obvious) - has anyone done a comparison of the ROMs?

My first thought was shamefully profiteering. I considered buying a stack of TOS 1.4 ROMs and reselling them along with details of the UK patches, to punters who would then blow their own EPROMs. Trouble with that is that many of the buyers would then flog the Atari ROMs, so I'd be encouraging piracy (and the fact that Atari UK brought it on themselves has no bearing on the legality). Anyway, I've got bugger-all capital.

Moving on, it seems questions about ROM versions are flavour of the month. Perhaps it would be a good idea if apratt or kbad could post a complete list of all ROM-based TOS versions in the field, with the following information for each:

1. Version number
2. Date hex-string (for identification)
3. Machine (i.e. 'STE only' for 1.6)
4. Hopefully, a *brief* list of salient features, such as bugs fixed since last release and known bugs

Is this a reasonable request? It occurs to me that registered developers may already have this, but it'd be nice if the rest of us could as well.

3517. STE vs ST Shifter

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 11:51:51 UTC
From: soohoo@cory.Berkeley.EDU
Message-ID: <20157@pasteur.Berkeley.EDU>
Source record: 246389

There's been quite a few ponderings in the last few days about the possiblity of an STE shifter that's pin-pin compadible with the ST shifter -- I just wanna add my $0.02 ;-)

The STE shifter outputs 4 bits of color per gun, which means that the DACs required to go to your video are gonna be different, no? It would mean Atari would have to lay out another chip that's an ST replacement shifter w/o the extra color bit... Seems kinda pointless for them, lots of R&D $$, little return, plus they'd need lots of packages to hit all the shifter versions out there...

Sigh, that's the way it seemed to me, not likely to be an ST STE shifter out any time soon...

--Kenneth "kens" Soohoo (soohoo@cory.Berkeley.Edu)
Atari Hacker (Atari's Hacker...)
"It could be worse, you could get hit by a bus..."
My opinions are my OWN, _not_ necessarily Atari's. But "hey", who knows?

3518. Shareware macs and international parochialism.

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 12:02:00 UTC
From: AMEIJ@vax.oxford.ac.UK
Message-ID: <8912020813.AA27879@ucbvax.Berkeley.EDU>
Source record: 246390

It seems to me that many of the people who oppose this development think
of the Atari world as the USA only, whereas most of it is here in Europe.
I have not yet seen ads for GCR here, just as Neodesk, for example, has only
just become available here. Commercial software takes longer to travel around,
if it makes it at all, so a European shareware product makes a lot of sense
for us. Of course, if GCR is so good, it will presumably sweep aside any
shareware equivalent as soon as it is sold here...

I have no desire for a MAC emulator myself, as, frankly, I think MACs are best
used as door stops or lump anchors.

Cuddles,
Jan Ameij

One netter asked if anyone had UltraScript experience. One work group at my company is PC based but one Atari enthusiast convinced the group to buy a Mega an SLM804 and UltraScript. Now, the PC users direct their PostScript files to the ST and everyone is VERY happy with (i) the quality and (ii) the cost effectiveness of the system. We have a lot of STs on site and the SLM804 has wowed a number of people - hopefully we can get more on site.

3525. THE MAC LAPTOP and STacey

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 14:10:10 UTC

Source record: 246397

Folks, I finally got to see one. At our Macintosh User's Group meeting, a Macintosh representative brought a Mac laptop in and I thought that I'd share a few impressions...specifically, with the Stacey in mind. Right off, the much-hyped LCD display was a disappointment to me. Recall that Apple spent a small fortune in giving an easy to read and FAST LCD. It is also larger than the standard 9 inch Mac screen. Refresh is incredibly fast, no lag at all. But the let down for me was the dimness and restrictive viewing angle. Other than screen refresh speed, I see no improvement at all over the bluish SuperTwist displays used by the IBMish laptops. If the Stacey ever makes it to market and it sports the SuperTwist, then we will be in good shape.

The much-hyped case was also a disappointment. Advertisements have it that the laptop uses the same plastic as that of motorcyle helmets. Maybe so, but I could flex the case. It creaked and would squeak. It did not have the same tightness as commercial-grade portable electronic typewriters and their construction.

Positive features were noted, i.e., configurable keyboard (you can swap the roller ball and keys, or install a ten keypad [very nice]). "Third Party" circuits (also known as 'cartridges') plug in a yawning space located within the case. In other words, these do not hang off the side as they do for the Stacey. Oh, how I wish that cartridges could be mounted likewise on the ST in a manner sort of similar to that of the ATari 800.

This particular laptop had a 40 meg hard drive mounted inside. It was the quietest that I have ever heard. Indeed, I never heard it.

After examining the laptop carefully (yep, the rep allowed us to take the case off and poke inside), I'm convinced that ATari is correct in holding production until everything is RIGHT. When examining the Mac Lap, it is obvious that a lot of pain was involved. Regarding the STacey, delays are unfortunate, particularly in a marketting-point of view, but the STacey needs to be RIGHT before it enters the consumers' hands.

With the heavy weight, the physical integrity of the box is going to have to be secure. Apple paid dearly for their design and I'm convinced after handling their expensive laptop that Atari is going to pull a major coup with the STacey (price in mind).

3526. Portfolio Concept

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 15:01:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8912020811.AA27782@ucbvax.Berkeley.EDU>
Source record: 246398

I like the Portfolio concept but I think that Atari should extend it. Just about everyone I know who has had to lug a Zenith, Toshiba, etc laptop with a 20 meg drive agrees that its a pain (in the shoulder as well as other places). Myself and a few others have taken to travelling with the old Radio Shack Model 100 because it is light, has a good keyboard, nice built in software and a modem (albeit 300 baud). The M100 keyboard is also preferred to the Portfolio's.

A few years ago, an 8K M100 sold for $299 Canadian - the bargain of the century.

Atari should get its OEM to bring out an M100 sized portable that has:

1. an 80 x 24 LCD display
2. an internal 1200/2400 baud modem
3. DOS (80c88) or TOS (CMOS 68000)
4. parallel/serial ports

If NEC could engineer the M100 about 4/5 years ago, Atari should be able to do something similar with a DOS/TOS system this year.

There is a large number of people who hate heavy laptops and would love a light laptop. Unlike the Poquet or the Portfolio, it does not have to be ultra small, like I said, the M100 scale is great. If a popular WP and SpreadSheet were included (Word Perfect Executive and Quattro) the system would sell well.

Hell, Atari could buy the rights for the M100 and sell it as is. Believe me, the concept of a light portable would do well if marketed right (then again Atari has not been known for its marketing skill!)

jonah@db.toronto.edu (Jeffrey Lee) writes:
>I'm looking for source to a portable C compiler.

I should have mentioned that I do know about (and have) gcc. It's too big and complex for the task I have in mind. I also know about Sozobon C, but I have yet to find a copy of this that is bug-free and can be cross compiled under gcc. (The source I had seemed to expect its own Atari-based libc.a and the source for that was not part of the compiler distribution.)

I need a compiler that can be run under Unix as a cross compiler AND is small enough to compile itself on a 1Meg ST with ONE 720K floppy drive. Standard K&R C preferred.

3529. MX2Net question

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 15:57:56 UTC
From: carlo@electro.UUCP
Message-ID: <1218@electro.UUCP>
Source record: 246301

I have tried to network two 1040's together through the MIDI port using the background networking program that comes with the MX2 multitasking kernel package. The results were so bad (10+ minutes to load Word Perfect; 1 minute to get a directory of the other ST's hard drive or floppy drive) that I can't believe that I've got everything configured correctly. Does anyone use this program successfully with acceptible results? What is going wrong? Is this really the way this program works? Please reply by E-mail and I'll summarize if there is interest.

>

Ken, a friend of mine wanted to buy my SLM804 laser printer. So, as I was going on a 2 week vacation around Thanksgiving I loaned my SLiMe to him. And guess what, it wouldn't work on his system! He has a stock 1040ST (a newer model where you can just yank the 1/2 meg of RAM and replace them with 1 meg chips to upgrade the ST to 2.5 megs). Anyway, there he is sitting with a 2.5 meg 1040ST, a SH205 megafile 30 and a SLM804, but the hard drive won't boot! So my friend scratches his head, re-addresses the DMA port on the SLM804, and still no go. The slm804 works fine w/o the sh205, the sh205 works fine w/o the slm. But add the slm804 and the sh205 won't boot.

My friend's solution was to go to Computer Works (God Bless Henry Ahle at CW!) and Henry suggested replacing the Atari host adapter with an ICD host adapter. And miracles of miracles, the system works fine now. My friend loves the SLM804 (unlike me who grew to *HATE* the beast). But, he couldn't get it to work in a stock Atari system. It took a third party vendor board (the ICD host adpater) to finally get the system working. So much for quality and good design at Atari!

So, Ken, any ideas WHY my friend's system wouldn't boot with the Atari host adapter? Oh yes, he was using the 6 EPROM TOS 1.4 and the AS373. Henry did the new TOS installation and everything (includeing his Spectre cart) worked fine until the SLM804 was hooked up.

> nothing else.

Ken, WHY was the cart port designed that way?? Are you guys just too CHEAP to add a decent buffer chip to the cart port??

>

> dealers should be able to get the scoop on this from the dealer support folks
> at Atari.
> --

You know Ken, that is ONE reason why I refuse to buy the new TT. If you can't even upgrade a Mega ST2 to 4 megs because of some manufacturing decision to save 10 cents by using a MMU chip that can't address 4 megs, then what does that tell me about Atari?? It is INSANE to sell a Mega ST2 that is crippled so that it can't be upgraded to 4 megs. That is another example of Atari's No Upgrade Policy. Why do you folks do that??

And are you folks going to change this policy with regards to the TT/p? Or if I want to add more memory after I purchase a TT/P will I have to sell it and buy another TT/p with more memory??

> ||| Ken Badertscher (ames!atari!kbad)
> ||| Atari R&D System Software Engine
> / | \ #include <disclaimer>

The sad thing is that I sold my SLM804 and am buying a Panasonic KX-P4450 laser printer. Much faster (11 ppm vs, 8 ppm for the SLM) and has builtin LaserJet+ and Epson emulation (and a whole host of other features). And the 4450 doesn't load the DMA port so I won't have problems with my 130 meg hard drives! I know that the slm804 is faster than any other printer, but the added features in the 4450 will allow me to use the 4450 with both Spectre/GCR and pc ditto/pc speed. And I couldn't do that with the slm. also, I will be able to use more ST software, programs which contain only printer drivers for Epson printers (such as Certificate Maker).

I am staying with the ST, and will try to buy a TT/p as a Registered Developer simply because, even with all of the ST's warts, and with all of Atari's lack of support, the 680x0 cpus are my cpu of choice. And the ST is MUCH easier to program than the Mac!! But, I am buying as much non-Atari peripherals as possible in the future. I own two ST systems and NEVER has Atari brand hard drives.

Oh well, life goes on.

thanx for the quick reply. that's all i wanted to know. after the above code didn't work, the first thing i tried was copying that memory range into main memory, and then fwriting. just wanted to check if it was something we screwed up in designing the co-processor card.

a further question: does that mean that with any of these hi-res displays that are available (ie: 1024 by 1024 type monochrome display, etc) you cannot save out the screen memory directly to hard disk?? does that mean that you are forced to always copy the screen image into main memory, and then save it out??

a further further question: does anyone out there actually own one of these hi-res mono displays???? if so, how do you like it??

RE: Atari dispersing info "free" about the ST(e) etc.

Remember on the 8bits the book "DE RE ATARI"?? And the OS guide and hardware guide that were available (don't remember the names -- the loose leaf ones)???

Why can't Atari do or condone something like that for the STe and other 68k products for the average Joe to use. Those above mentioned resources were what got me really interested in Atari -- a lowly high school kid could learn all about
how to make a computer do neato stuff. And I didn't have to become a registered
developer, pay too much money, etc.

Chad

DEC has no opinions!

GC> The ONLY Kermit I trust is UNITERM's so WHAT problems are there?

I too like and trust Uniterm, but there is a small, subtle bug in the
8th bit quoting negotiation. Here is a copy of the message I tried to
send to Simon Poole:

Date: Mon, 31 Jul 89 13:03:36 EST
From: jmberkley
Subject: Uniterm Kermit and 8th bit quoting negotiation

I'm having trouble with Uniterm and 8th bit quoting. When Uniterm and
Ckermit negotiate, the transfer does not correctly go into 8th bit
quoting. I asked Frank da Cruz for advice and debugging assistance.
A summary of his reply is printed below.

The problem seems to be that Uniterm says '&' for 8th bit quoting, and
Ckermit replies with 'Y' (meaning yes I'll do it). But Uniterm takes
the 'Y' to be the 8th bit quoting character (!). The 'Y' reply by
Ckermit is documented in the kermit protocol manual from Columbia.

If I set the 8th bit quoting character to be 'Y' in Uniterm, then 8th
bit quoting is properly and successfully performed.

I am using the latest version of Uniterm from cs.orst.edu (sorry, but
I cannot remember the version number right now) and Ckermit 4F(085).

Thank you

Ieee! Source code only? The net distribution included binaries as well as
sources.

>I have tried to use the make facility on the supplied files. I had my normal
>Soz C work disk in the A drive and the 1.2 source in a ram disk, installed
>as drive d:. I then made the source files the active window and ran the make
>utility by selecting it using the right-left double click technique and then
>selecting open from the desktop. But it still didn't work.

Under (almost) no circumstances should you try to use any of the Sozobon
programs directly from the Desktop. In this example, how are cc and make
supposed to know where to find hcc, top, ld and jas? They look at the
environment, which is for all practical purposes the dark side of the moon
if you run from the Desktop. If PATH= doesn't point to the folder that
contains the executables, and the executables are not in the current
working directory, the compile will fail.

>I do have a copy of the Gulam shell, but I haven't used it very much yet.
>However I will dig it out and blow the dust off it if necessary.

Do so. Definitely.

In addition to providing a proper environment string, Gulam (or any other
competent shell) will pass arguments to the Sozobon compiler and utilities
without mangling them. GEM Desktop uppercases everything, and the Sozobon
programs are sensitive to the case of arguments. cc -o and cc -O do not
mean the same thing.

Except for one thing. In Medium res the Atari get 16 colors per screen. I may be stupid but doesn't this already mean that the shifter has to output 4 bits (4 bits = 16 colors)? All they would have to change is the total number of colors available (from 512 to 4096). And that is just the difference of having more shades of the same colors. The primary colors (Red, Green
A

just my $.02 worth.

Collin Douglas

cbdougla@uokmax.ecn.uoknor.edu

and Blue) each with 16 shades gives a total of 4096 colors (16^3).

NeoDesk (from your local dealer, or $31.95 from E. Arthur Brown Co.,
612-762-8847) does this and more. Each file .ext can be associated with
its own icon. Program icons can be dragged out onto the Desktop, so you
can click and go without having to navigate through folders. It also
provides "hot keys," a printer queue, faster windows and even a digital
clock, all in 21K of RAM. It's what the Desktop should have been all along.

Except for the fact that I don't give much for Atari Corp. policy,
I still think this is an isane behaviour. In short sight, it might not
pay off informing end users, but I can assure you -- you won't be able
to sell a lot of computers if you don't tell them how to program it!

I do understand it is impossible to, for example, send out information
to each and every user that bought a ST, but it must be possible to
post a minimum of information to some knowledgeable people in the right
places.

The net, if used right, could be a source of inside information about
how to do things [like the posting of ARGV defs! *GREAT*] and what not
to do. And there're a lot of developers on the net, too.

And people from the net DO forward things to the right places. In a
few days, many more than those who read news would know. Interesting
information is spread further through FidoNet and by mail, personal
contacts and phone calls.

Let's say that I tell 15 people how to do. They tell 15 more each,
and in a week at least 15^5 persons would know how to do. This is
around 760000 people! (To be compared to around 400000 STs in Sweden...)

This isn't cost effective?

"Who ask"?

It should at least be "cost effective" to give this information to
developers without them having to ask! It is ATARI that should be trying
to get more customers, more developers and more programming done on the
ST -- this implicates more STs sold. Right? Not the so called end user
trying furiosly to get his computer.

Why should I buy a computer I can't use? Like buying a car and when
you ask for an explanation of the buttons getting the answer: "Sorry,

you have to be a registred driver to get to know this. You shouldn't know about more than the gear and the wheel."

A lot of people have been complaining on Atari Corp. lately, and even more people have been complaining about this.

Have nobody thought of the possibility that there might be something wrong? Why should we otherwise be bashing Atari? No, we only want to get the most out of the computer.

Someone wrote that there must be a lot of people who wanted to take care of one bug each. I would love to, but I don't think this is possible. But we ARE doing our best to help!
I have offered to help writing some demonstration programs to be put on the STE language disk. I haven't even got a reply. Atari Corp. was obviosly not interested.

I do not want Atari Corp. to die -- I want to have an Atari computer, otherwise I wouldn't have bought a STE. But I do want to be able to program it without paying more money than necessary money for it!

[BTW, I will soon post a couple of examples of how to program the STE. A lot of thanks to Ralph Haglund, qralph@dna.lth.se, for the translation from german!]

And to those from Atari who're reading this: Wouldn't it have been cost effective posting slightly more than two pages of text to the net? One thing more: Why not give this to the responsible people? I know it isn't your fault, Ken and Allan.

Disclaimer: After all, this is *MY* opinion.

A few questions about harddrives:

1) What kind of controller would I need for a NEC D5124 or NEC D5126?
The first is a 10 meg and the 20 a twenty meg.

2) Same for a 30 meg WREN CDC BJ7D5-A.

3) Can you buy the ATARI host adapter and how much is it?

Thanks, Randy

If you really want this to happen, talk to Adobe. As far as I know,
the major cost of _any_ PostScript-compatible device or software is
the royalty paid to Adobe for developing PS. Thus, UltraScript is
not likely to drop in price. Can anyone confirm this?

Buy NeoDesk for Gribnif Software. Not only can you change the
trashcan, and file cabinets, but you can change the icons for individual
files, or groups of files. It's absolutely amazing how much an .ARC
file sticks our from a directory when it looks like Noah's arc...
NeoDesk does a lot of other neat and fancy things, and is well worth the
money you have to pay for it. It will use 21K of memory that won't
be available to other programs, but again, it's well worth the memory.

UltraScript is a PostScript _emulator_. All of Adobe's PostScript is published it what is known as the _Red Book_ and it has all the commands that
make PS neat. However, it doesn't have the hints that Adobe uses in their TYPE 1 fonts to get them to look really good on small resolution printers. You pay royalties to Adobe when you buy your PS interpreter from them to sell.
Imagen (or QMS who owns Imagen is a major printer manufacturer) wrote their own interpreter to do the dirty work. No royalties to Adobe since their not using any of their official product, just format. This is why US won't use Type 1 Adobe fonts (including the stardard LaserWriter + fonts). It uses a format called Type 3 which out in the public to use on PS interpreters. Confused? Sorry if you are. Now you know how most Mac users are going to feel
once System 7 hits.
Most of the cost of US comes from the fonts (CompuGraphic fonts?)
Spectre also does not do PS at 144dpi but ImageWriter emulation which is a QuickDraw game. David Small could probably do 300dpi but it would be again QuickDraw just like the LaserWriter SC. IMHO, he is waiting to get PS emulation working before going to 300dpi because that's what people would expect anyway.
Sorry for the ramblings, enjoy!

rehrauer@apollo.HP.COM (Steve Rehrauer) writes:
| I know what you mean by "Line F", but what's the "compression" refer to re:
| ST ROMs? (Usually I'm only this dense on Mondays & national holidays...)

The line F compression I refer to is a method we used in ST ROM which
basically replaces common operations with line F instructions. The
line F handler is able, by decoding the $Fxxx instruction, to determine
what operation to perform. The handler then dispatches the exception
to the appropriate OS routine.

rehrauer@apollo.HP.COM (Steve Rehrauer) writes:

| Is there an approved method for software to discover what
| platform it's running on, other than (KLUDGE ALERT!) checking the TOS
| revision #?

Yes, there is a new OS service offered in the ROM, beginning with
STE TOS, called the Cookie Jar. The startup code in the new ROM versions
set up an area of memory with "cookies" which describe various system
configuration options, and with values for the cookies that describe
what's actually there. The Cookie Jar documentation is available to
developers now, and we will be making it available to the general public
shortly.

3549. Re: Diff between TOS 1.0 and 1.2?

Newsgroup: comp.sys.atari.st
Date: 1989-12-01 22:35:16 UTC
From: kbad@atari.UUCP
Message-ID: <1843@atari.UUCP>
Source record: 246321

daveba@hpsad.HP.COM (David Ballo) asks:

| Would some knowledgeable person kindly outline the differences
| between [ROM TOS (1.0) and Mega TOS (1.2)]?

The major difference between the original ROM TOS and Mega TOS is
BLiTTER support. Some VDI operations were optimized a bit in Mega TOS
as well. GEMDOS uses a larger amount of memory by default in Mega TOS,
so some programs which barely fit in a 520ST ran out of memory in
Mega TOS.

| Also, is it worth it to upgrade to TOS 1.4 (for a hundred bucks!)?

Well, I'll let the rest of the netters who have the upgrade answer this,
because anything I say on this subject is tooting Atari's horn <grin>.

But I'll offer the following:
Many, many TOS bugs are gone in Rainbow TOS.
Many internal limits in TOS have been lifted.
Hard disk I/O is much, much faster.
Program launches can be made much faster.
You can rename folders, no more making a new folder and then copying
all the files in, then removing the old folder.
The Desktop is much more convenient, preserving the time/date stamp of
your files on copies. The Rainbow TOS Desktop lets you _move_ files and
folders, using Control-drag. You can abort a file copy or move operation
by pressing [Undo]. A lot of the dialogs are more intuitive.
The AES gives you a much nicer item selector, with buttons for all the
drives, and an optional title string when supported by software. The
Rainbow TOS AES also lets you auto boot a GEM application, configured
by the "Set Preferences" menu item in the Desktop.

That's only the stuff that came to mind as I was typing, there's more...

3554. MOUSE PROBLEM

Newsgroup: comp.sys.atari.st
Date: 1989-12-02 00:55:29 UTC
From: MAXG@SUVM.ACS.SYR.EDU
Message-ID: <8912020824.AA28427@ucbvax.Berkeley.EDU>
Source record: 246326

Well, I'm having a problem that I would have never expected (the cause of which, I believe, is my daughter's playing one of her favorite games): it seems that it is hard to get the mouse to recognize button clicks. It doesn't seem to be a problem with the contacts themselves, because I can take apart the mouse and press the contacts with my finger---and those clicks are recognized consistently. It seems to be a problem with the plastic housing. When I look at the mouse from where the cable comes out of it, the left button (which is on the right when viewing the mouse from this perspective) is definately lower than the other...especially toward the middle of the mouse. I was really scared for a few minutes at first, because the ST wasn't recognizing the clicks AT ALL...After taking it apart, however, I seem to have gotten it back to a point where it recognizes clicks...but it is not consistent.
Does anybody have any suggestions? or do I just have to continue to click hard, until the thing dies altogether?
As always, thanks in advance for any advice.

> pretty boring and I am due for a change. Thanks.

I recommend NeoDesk. You can draw your own desktop and program icons.
But those are minor enhancements. It's other features for file
manipulation are simply superior to the normal desktop. I don't use the
normal desktop anymore. NeoDesk is much more fun. It's one of my most
used and favorite programs for the ST (competing with UIS II).

If you have a hard drive or more than one meg in your machine, you should
consider getting NeoDesk very much. If you have one meg and no
hard drive, then you should take a look at NeoDesk and see whether its
features outweigh its disadvantages. It takes up 150K when it's installed
and running. You can either keep it in memory when you load a program from
it (it's a shell), or have it erase itself from memory, in which it only
keeps 20K of itself in memory. When you exit the program you loaded, it
loads itself back into memory.

BTW, does TOS 1.4 copy the same way that NeoDesk does, loading all the
files to be copied into memory and then dumping them to the destination?
Or does it copy them one by one?

3556. Other laser printers????

Newsgroup: comp.sys.atari.st

Source record: 246328

My spouse uses our ST to layout a section of a large-circulation Canadian magazine. We use Calamus and a Lino imagesetter for the final flats, but for proofs, we use the SLM804. 5 minutes for a page? What a joke! Who the hell uses a laser printer and only prints out single pages? We can print out a hundred pages in well under a half hour on the SLM804, that would take more than an entire business day at 5 min/page.

For playing around, another laser might be fine. If your time is at all important to you, buy an SLM804.

3558. FORM, nice but...

Newsgroup: comp.sys.atari.st
Date: 1989-12-02 01:20:42 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <274@watserv1.waterloo.edu>
Source record: 246330

FORM is really neat. I have a complaint about the manual. First
of all, it is formatted in 6x7in format. When printed on 8.5x11in paper
a lot of paper goes to waste. This really annoyed me considering how essential
it is that we stop wasting natural resources. The PD version of the manual
is a TeX dvi file and most people would print that on letter sized paper,
so why couldn't the author have included '\vsize = 10in \hsize = 7.5in'
before he TeXed it so we don't waste paper. Also, the manual lacks
inclusive speech and inclusive speech is important as we attempt to include
women in our language (and ultimately as recognized members of society).
I realize this doen't really belong in this newsgroup, but the comments
are directly related to a product of this newgroup - since the computer
industry spawns documentation, we must strive for these ideals: conservation
of paper (in manuals, printouts, etc) and inclusive speech.

I have Timeworks DTP and two printers. One printer is a relatively new Panasonic which has 9 pins and works very well. However, my other printer is an old BMC with only 8 pins. It so happens that the 8 pin printer is the one I have here at college. Every time I print something using it, I get lines through the printing (I assume this is from having 1 less pin than I'm supposed to). In the setup program I didn't see any 'Epson 8-pin' selection. My question is quite simple, can I make TDTP work with my BMC (eliminate those white lines)?

During Thanksgiving vacation I went to an ST dealer in San Francisco and the technician told me that he ordered two TTs the previous day at $1000 a piece. He said that when he got them at the end of December, he wanted to be locked up in a room for a month to develop on it. He said that the retail price would be $2000. STart magazine said they would be sold for $1500.

So, I guess Atari's going to be getting a lot of registered developers, according to Spieu. :~)

The tech also ordered an STe, he said.

The dealer said his Portfolios were selling like crazy. No word on the STACY.

Exactly the same here. Through various strange machination I discovered
that our VAXes had both Kermit and Xmodem. Out of 6 programs for 2
machines, ONLY Uniterm's Kermit is able to transfer binaries. The only
Kermit I have for the Amiga does not transfer correctly, and ABSOLUTELY
NONE of the Xmodems will work. I must say I was surprised to read that
it had bugs, since it's the only one which works for me...

3566. GFA compiler

Newsgroup: comp.sys.atari.st
Date: 1989-12-02 14:41:47 UTC
From: gilmore@vms.macc.wisc.edu
Message-ID: <2749@dogie.macc.wisc.edu>
Source record: 246338

Hi.

On Tuesday, I tried to order the compiler for GFA BASIC 3.0 from Computability (no one I know has had problems with them). They told me that it exists, but was not available, and it was rumored to be included with the interpreter. My interpreter was the older MichTron release, and I have no desire to shell out for it again. I have the compiler for the original release, however. Does anyone out there have additional information? I really would like to get this, as C makes me gag, although I have Laser C. (Too many class projects in C.....)

> (16^3).

>cbdougla@uokmax.ecn.uoknor.edu
>
Collin,

You're confusing "bit planes" and "bits per gun"...
Lemme explain:
The number of bit planes in a specific resolution determines the number of color _table_ entries you can access for a given pixel in that resolution -- in Atari's low res case, 2^4 = 16, medium, 2^2 = 4, high 2^1 = 1... Ok, no each color table entry can be filled with a number that's going to determine which color is sent to the screen, and in the ST's case that number has 3 bits assigned to each RG^B, for a grand total of 2^9, or 512, colors possible to be assigned per color table entry... So you can have 16/512 colors on the screen at the same time without resetting the color table mid-screen...
Oh, anyway, so the STE's shifter has the same number of bit _planes_ per resolution, but an additional bit _per RG&B gun_, so that each color table entry can be one of 2^12, or 4096 colors... SO now you can get 16/4096 colors on screen at the same time.

A DAC takes the value in the color table entry and converts it from the 0's and 1's representation into a voltage value for the monitor. With an extra bit being sent to a DAC that only understands 3 bits, we have a fundamental problem, and unfortunately I don't think it can be ignored.

There is an excellent program for TOS with GEM called NEODESK 2.05. It
totally repleaces the GEM user inerface on the ST. With NEODESK, it is
possible to make your ST interface look like the MacIntosh interface.
NEODESK 2.05 is available from Gribniff Software.

Message-ID: <891202130042340.GKWQ@RAI.CC.FSU.EDU>
Source record: 246341

Anyone looking for a great game to give to themselves for X-mas?? Well, I have seen a real doozy! It's called Stunt Car Driver, and is roughly a cross between Falcon and Pole Position. You are the driver of a stunt car in a 3-D gamespace, jumping and swerving, etc. Excellent graphics, and has an option for connecting two ST's via (null) modem for some really good two player action. All in all, worth the price (rare for a game).

Source record: 246342

Could someone please reitterate the problems with DC Formatter's format routine? I remember some net space being devoted to it, but I had not had any problems, so I didn't really look at it. Now, two of my floppys have bitten the dust, for no apparent reason, and I become concerned. Please include which version is flawed (if it is flawed), I have both 3.01 and 3.02, and would like to know if there is any advantage to using one over the other. Also, is it true that an ACC version is available via Shareware cost? I have not yet gotten around to sending it in!

Aaron -

There is a glitch with the 'redial' command in the dialer menu. It apparently decrements FIRST, and then checks for retries == zero; if you have retries set to equal 0, it is VERY persistent at that point (:-).

Set retries to 1, and it will not attempt redials.

I have a Toshiba DSDD drive, and it is excellent.

Not only is it slightly faster than the standard Atari drives, but it
also reads and writes past track 80 reliably. I use DC Format to stuff
more than 800K onto my disks with no trouble.

They are also cheaper than Atari drives. I picked mine up for $99 (US).

3575. PC DITTO Config HElp

Newsgroup: comp.sys.atari.st
Date: 1989-12-02 20:41:34 UTC
From: psurge@cs.utexas.edu
Message-ID: <7277@cs.utexas.edu>
Source record: 246347

This is for the person who wanted help in their CONFIG.SYS file on PC-DITTO

I have a 20 meg hard drive with 4 partitions, 3 gem and 1 mac. The Gem partitions are C,D, and E. This is what my CONFIG.SYS file contains:

```
buffers=25
device=pc_dhd.sys
device=pc_ddrvr.sys
```

The first is to reset the number of buffers to handle the hard drive, the second is the hard drive handler, and the third is the high capacity drive handler, it allows MS DOS to read ST disks (on my system as drives F & G). If it means anyting I am using PC DOS 3.3, I think.

Message-ID: <891202.20344319.018989@SFA.CP6>
Source record: 246252

Hello folks,

We've tried two real issues of Blood Money on three different
ST's, a Mega2, 1040st, and 520st upgraded to a two megs. Both
Blood Money products will not boot on any of these STs.
During bootup attempts, we get a screen that goes to black, the
drive whirrs and bumps, and then the screen goes to white. Afterwards,
the computer is reset.
Incidentally, Xenon2 boots perfectly. An earlier report on this
end stating problems with Xenon was a hardware problem.
Can anyone comment on Blood Money. It was purchased as a result
of using the Blood Money game included in a European magazine. Gotta
have it but we can't get the two bought copies to work!!!!

3581. Placement of TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 03:53:07 UTC
From: asqb-sep-a@HUACHUCA-EMH2.ARMY.MIL
Message-ID: <8912030811.AA08915@ucbvax.Berkeley.EDU>
Source record: 246253

I picked up TOS 4.1 today -- had to drive to Phoenix (I live in Tucson and we have no ATARI dealer) to get it.

I was wondering if anyone can help me with the correct placement of the TOS 1.4 chips?

I tried two different iterations:

A. L0
L1
L2
H0
H1
H2

B. L0
H0
L1
H1
L2
H2

These configurations are in a 520 ST that's been upgraded to 1M via piggyback.

My TOS 1.0 was in the following configuration:

--------0
--------1
--------2
--------3
--------4
--------5

Can't remember the numbers in front, but you get the idea.

In either configuration the screen (mono) stays dark and nothing happens. Was just going to try a few more configs but thought I would ask first and save the wear and tear on the pins ;-).

Thanks for the help.

>to the appropriate OS routine.

This brings up the question of what the ROM code does instead. Have all the
little line F routines been made into subroutines, with more-or-less ordinary
subroutine linkages (I don't know the exact count, but there are A LOT of
line F routines)? Are the routines invoked by subroutine calls to a
dispatcher (a la GEMDOS)? Has the code been brought inline?

Of COURSE this is just idle curiosity, but if the answer is 'brought inline',
I'll expect a noticeable speedup in STE performance.

Message-ID: <8912030822.AA01374@jupiter.nmt.edu>
Source record: 246256

Hi Folks!

I have the panarthea ZMDM.PRG. I also have the UNIX end of zmodem
that is posted in the panarthea/sources listing. I believe I have compiled
all the UNIX C programs right, but I still can't get it to transfer binary
files. I and my friends, some of whom have a good amount of experience with
zmodem, could get text files to transfer, but we had no luck with binaries.
I also tried transferring binaries using the included UNIX Xmodem and Ymodem
programs, but they didn't work either. I used Uniterm 2.0e with the X and Y
transfers, and I used ZMDM with the Zmodem transfers. I was wondering if
anyone had the same problem. If so, I need some help. Until then, I guess I
will just have to settle for Kermit (too slow) or by doing a file capture
as a file is being uuencoded on the SUN (Not elegant :-)).

Thanxs.

3586. Re: question SPECTRE GCR

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 09:18:13 UTC
From: dsmall@well.UUCP
Message-ID: <14801@well.UUCP>
Source record: 246258

The referenced question asks compatibility between Spectre GCR/1040 ST and a Mac II.

We have had no problems in our lab moving a considerable number of disks back and forth between them. My only suggestion, on the 2.0/2.3 release (they are the same, BTW) is to format on the Spectre. Spectre formats to 1:2 interleave, which makes for fast Spectre GCR writes, and Mac II formats to 1:1 interleave, which makes for slow Spectre GCR writes. (We expect to fix this in the 2.5 release).

Try replying to "hplabs!boulder!tcr!gadgets!dsmall" and see what happens.

-- thanks, Dave Small / Gadgets

3587. Re: Spectre and other Mac emulators

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 09:39:42 UTC
From: dsmall@well.UUCP
Message-ID: <14802@well.UUCP>
Source record: 246259

The referenced note contains several suggestions to Spectre GCR.

1. On Multifinder reliability, we have just recently (since releasing 2.0/) discovered that Multifinder is reading from location 0. This causes havoc with its memory mangler; it means a dangling pointer (address = 0). Once we fixed that, Multifinder grew rock-solid; we ran it at Comdex for five days straight, and could only crash it with a specifically non-MF friendly DA.

This is the same bug that crashed Microsoft Word 3.02, which now does "Page Preview" properly and doesn't run out of memory. I've chased it for a year and half now; it's good to win at last.

2. Shutdown should work; if not, we broke it between beta and release. Restart can't work, as it executes a RESET instruction which clobbers the ST hardware. However, a fix for that is in the works for the 2.5 release (along with the multifinder/word 3.02 fix).

3. I agree, we should let you format Spectre disks from inside Spectre. We didn't only because of space reasons; getting 832K mode up, which is the tightest memory squeeze, with GCR inside was very very hard. For instance, we had to delete all Translator One support code, and that didn't help enough. We hope to do this, however.

4. Macintosh true SCSI support is very tricky. While we're researching it, no promises there. There are timing and emulation issues that resemble Vietnam.

5. Sound improvements. We're already working on true 60 hz sound, so the pitch is correct. We're also working on ST-E DMA sound, which will give sound with little to no slowdown (!). System 6.02 and above changed the ground rules for sound, but we hope to have that working soon; it's a matter of figuring out why sound works on a real Plus, and not on a Spectre -- a comparison of traces, really.

6. The GTS-100 drive we bought just for this is currently in with a major drive guru being prodded; we hope he can come up with a fix. We'll let you know
wehwhen we know something.

The current 2.5 version, unreleased, also has an online configuration page (press HELP and it pops up; press function keys, and various options toggle), and many other goodiesgoing into it. Doug Wheeler is doing an outstanding job hacking on it, and is even (*shudder*) cleaning up my code.

Basically, it sounds like we're in agreement about where Spectre should go in the next few months. Hope you like 2.5, when we release it.

```

```

3588. Re: Want a fast Atari ST...how about a '030 chip?

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 09:43:44 UTC
From: dsmall@well.UUCP
Message-ID: <14803@well.UUCP>
Source record: 246260

The referecned article states that since the proposed Gadgets 68030 board runs at 16 mhz, and the Mac IIci runs at 25 mhz, the Mac will be faster.

One option I am very much pulling for is a 32 Mhz clockrate on the 68030 board. It's available and it keeps the bus synchronous.

We hope to see first prototype boards around Christmas. Remember, this project is primarily for us, for inhouse development; the decision to market it to the general public has not been made. I'd like to turn loose a 32 Mhz 68030 on some of my assembly projects -- and none of this waiting for 8 mhz ST hardware, either.

3589. Re: TT and MAC-,PC-emulators

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 09:52:28 UTC
From: dsmall@well.UUCP
Message-ID: <14804@well.UUCP>
Source record: 246261

The referenced question asks if the Spectre 128/GCR works with the STE or TT.

It does work with the STE, with no apparent problems.

(It also works with Stacy, with one minor configuration/setup
hack; just disable logical device "1" on SCSI drive 0, then SAVE SETTINGs.)

It does not presently work on TT. While the cartridge physically fits,
and the basic Spectre menus work okay, we've been unable to get a TT nor
specifications, and thus can't guarentee it will work. In addition,
GCR support, Hyperweb (tm) and writing make it difficult for me to find time
to work on a TT version; fortunately, we have Doug here to help out; maybe
he'll have time.

Note that some advertising currently says Spectre 128/GCR works with
TT, including some Atari ads. Whups.

3590. Re: Is Spectre going MIDI>?

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 09:59:22 UTC
From: dsmall@well.UUCP
Message-ID: <14805@well.UUCP>
Source record: 246262

The referenced post asks if sources close to Dave Small can confirm whether or not he's working to bring up Mac MIDI.

Sources close to Dave Small report that he dosn't have many good ideas on how to do this, short of rewriting some low-level I/O routines in some Mac programs.

The basic I/O isn't the problem; I can do that. The *timing* is the problem. The typical MIDI output needs to be interrupt driven, and uses the VIA timer chip for the interrupts. There's no such chip on the ST. It also uses
the SCC chip for serial communications at MIDI speed.

Now, of course, if someone mounted a VIA and SCC chip on the Atari bus ... (no comment).

3591. Re: INFO-ATARI16 Digest V89 #727

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 10:22:26 UTC
From: dsmall@well.UUCP
Message-ID: <14806@well.UUCP>
Source record: 246263

The referenced note asks why it's so difficult to make the Atari ST talk Appletalk (now called Localtalk).

Basically, the Atari doesn't have the needed chips built in. Apple uses the SCC high-speed serial communications chip to drive Appletalk; it's interrupt driven also. Atari's MFP tops out at 19,200 baud, if I recall correctly. Also, the VIA timer chip in the Mac appears to be in the mix somewhere.

So, it's a matter of adding several chips to the ST, a machine that was not designed to have chips added to it (to be charitable). Then, it's a matter of hooking up software wiring to th pseudo SCC, interrupts, and so forth.

That's the basic problem. Let me know if I need to explain further.

This is kind of a simplistic solution, but...

Most 5-1/4" floppy drives need their seek rate set to 6ms. This is done
(usually) with an auto-file program. Is it possible that your normal boot
disk is missing the seek-rate setting program?

yawn

OK Bob, you've convinced me.

Atari is the evil empire on earth. Neil Harris was their point man
(possibly the devil incarnate?). It's fortunate that we (that's us,
the forces of Good) were able to seperate Neil from Atari.

You've established that your dozens of earlier post's were justified, your
credibility has been proved impeccable.

It's a good thing you chose the route of posting repetitive emotional
messages on non-issues followed up by reactionary defensive postings to
establish your current exalted status. Most people would have chosen the
more common method of posting well-thought out and objective messages on
interesting topics.

Please, do reply (directly of course, this is far too good for the general
populace). I am always prepared to deal with your posts appropriately.

Source record: 246266

I also understand your problems. Some of them may be solved by
using the 'script' commando from the library manager. May be, the
linker also has cuch a command. There is still no way to do it via
command line options.

But it is even worse. Recently I tried to impement the NAG graphics
library (*only* about 350 routines). For I had impemented it before
on my UN*X system, I created two one pass libaries (using the output
of lorder and tsort) on my ST. The linker map told me, that no routine
was missing. So I started the test program. There was neither a label,
nor a loop construct in the main program, but the code managed to
build up a never ending loop.

Ok, I took the linker map from the ST and concatenated all modules
which should be neccessary to build the program to one file. I compiled
and started the program. I was somewhat surprised, that the run-time
link-loader now told me, that one routine was missing.

To make the long story shorter: The linker had found about 22 modules
in the libraries, but additional 25 ones had to be linked to build a
working program.

Conclusion: The compiler of Absort Fortran may be nice, but beware of
the linker. May be I 'll be using the Prospero product despite its
longer compilation and linking times.

Yeah I had this problem with my copy too, in fact I had it twice.

Initially the game worked fine then after trying to examine the disk contents by opening the Floppy Disk Icon A and then trying to boot the disk I got exactly the same result as you. Nothing I could do would recover the disk so I sent of to the manufacturer and got a free replacement.

Sorry I can't be of any assistance, but I suggest you do the same.

>joke! Who the hell uses a laser printer and only prints out single pages?
>We can print out a hundred pages in well under a half hour on the SLM804,
>that would take more than an entire business day at 5 min/page.

Dave, yours is the first message I've seen from anyone using Calamus with
a real typesetter. I'd like to know a lot more about it, including:

* What Linotype model? Price?

* Precisely how is the interface configured? I've heard that the ICD (or
Ditek) folks have rigged some way to bypass the Linotype RIP processor
and just blast bits from the Mega ST to the typesetter's laser. True?

* What memory requirements does this impose? If you're running greater
than 1200 dpi density on the output device, doesn't that suck RAM in the
Mega ST?

* How fast is it?

* How big a page can you manage? A Mega/Linotype setup that could blast
out tabloid newspaper pages could be a formidable setup.

* Doesn't the Lino gag at the thought of Compugraphic fonts? (Just
kidding.)

* Is anybody OEMing this sort of package?

* Is there a Linotype plain-paper high-resolution printer that will run on
such a setup? (One of the big selling points of laser xerographic
typesetting has been that it can cut the production costs of the average
U.S. weekly newspaper by $20,000 a year by avoiding silver-based
phototypesetting paper, according to an informal survey taken by
the American Newspaper Publishers Association.)

I also could not boot Blood Money on my 1040ST (with TOS 1.4). I am absolutely fed up with the copy protection on some games, most notably Psygnosis/Psyclapse. When I try to boot the game up, I get a black screen, and eventually the disk stops.

I should have been skeptical when I asked for a demo at the dealer I bought the game at and HE couldn't get it to run on the store's machine!!!!

To date I know of no one who has been able to get it to run on their ST.. I've only seen the ST Demo (which does work with TOS 1.4), and the Amiga version (which is FANTASTIC).

Well, I returned the game and should have new disks for it later today. If they don't work either, well I'll just have to spend the $30 on DMII instead. (not that I wasn't planning on buying it anyway.. :-)

Oh yea, the dealer I bought the game from told me that there was a bug in the protection in one of Psygnosis games. This bug would cause the drive to attempt to seek all the way up to track 700 (!!!!!!!). Apparently many drives were ruined and Psygnosis had to replace them.

>
>
>
>Bob Marley

Version 3.02 fixes a bug which existed in the verify routine.

The problem would occur if a bad sector was encountered on one of the first two tracks. An alert would come up and say '0 bad sectors. Mark bad?'

If you marked them bad (or even if you didn't) the disk was unusable. V 3.02 has an alert that comes up and says 'Error in FAT/BOOT sectors' and that is that. If an error in format occurs on the first two tracks, the disk is not usable.

DCF 3.2 is available for a shareware fee (you decide how much). On the disk that you get back, you get alot of our other programs too. It is quite a deal.

As for your disks getting trashed, disks have been known to go bad, and no formatter can be flawed in such a way that they stop working after a given amount of time...

Demanding that ANY written material be "politically correct" in the mind of every reader is impossible. And expecting documentation to actively serve an arbitrary set of external political goals is silly. Docs aren't political essays, and I surely hope they stay that way.

I have a different problem with the Form documentation: TeX. Seriously, is a 430-kilobyte DVI file an efficient method of distributing docs? Especially since the number of STs actually running TeX is mighty small.

I'm considering tossing the whole Form package into the trashcan rather than forwarding it to the Minnesota Atari ST user group. Think about it: Some semi-serious user spends an hour or so downloading and unarchiving the whole thing, only to discover that he (or she) can't even read the docs without obtaining several megabytes' worth of TeX crud and a college education in TeXwizardry. I'm not flaming anybody, just pointing out a practical problem. At some point the pain-in-the-butt factor exceeds the utility.

On a (sort of) related subject, does anybody else find the shar'ed source code in comp.sources.atari.st to be a constant source of trouble?

The shar format doubtless is an excellent solution for Un*x systems, but for non-Un*x sites, there is just enough variation in the formats to frustrate any attempts at automated unpacking. One of the TOS-based shar utilities that I use here has a bug that makes it double lines. Another can't handle shell archives that do not have a strippable character (usually X) prepended to each line.

I almost always wind up having to repair the sharred sources or the resulting files with a text editor, and often it's easier just to split up the shell archive manually with MicroEMACS. Arggh! UUDecoding a .ZOO file is *so* much simpler.

Source record: 246274

Dear Mr. Rymal!

I think in Your contribution for/against the shareware mac project You missed something very important: the Aladin (the projected program) has been on the German market quite a few years as a commercial product. Its price is comparable (slightly lower) than Spectre 128. Recently, Aladin and Spectre 128 (1.7, the more recent ones are not available here) have been compared. Aladin has been judged to be the more stable, slightly faster and less buggy program. And there is supporting hardware to copy disks if I remember correctly. So, Aladin seems to be the second best of the Mac-Emulators around --- after Spectre GCR which is totally overpriced in my opinion.

Concluding, with this (quite expencive compared to other shareware, of course) shareware You get a *really* professional 64 k mac. Definitely a better one as with the magic sac.

I am not connected in any kind to the author of aladin, nor do I plan to use a Mac-Emulator at all. I only refer to a newspaper article and some prices I have seen in ads.
And I think we should not discourage such a plan by Atarinet-typical bashing.

3603. NOTATOR vs. FINALE (mac)

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 19:54:59 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4739@blake.acs.washington.edu>
Source record: 246275

For those who are reading this newsgroup and debating
between the mac and the atari for a music notation system,
consider the following:

With NOTATOR and the ***** ATARI LASER ****** i can
print a 7 page score in under 7 minutes... and it looks BEAUTIFUL!

I am told by a colleague of mine who runs FINALE ... the much raved
about notation package for the mac, that it can take as much as
a FULL HOUR to print a SINGLE postscript page of music.

Unfortunately, i still know people who are buying macs for music..
While ATARI at this time has the upper hand in music sales...
they could easily clean up if they put some effort into getting
ATARI systems in the high schools and universities.. in studios etc..

Word is out in the electronic music magazines that NOTATOR is the best
available for any of the home computers. Fortunately, NOTATOR will
NEVER be ported to the MAC... ATARI should jump on this put some
serious thought and effort into breaking into the education market.
Between music and desktop publishing and all the other great software
already available.. people can't help but catch on to the fact that
this machine is great.

A TT would be a great server for an education system... as well as
a fast music processor... fast enough for professional studio
work as well. I am shocked to have learned the other day that
the developers of NOTATOR who are from GERMANY.. where there are
over 350,000 ST's.. have yet to get their hands on a TT. David
Small does NOT have a TT yet... In addition to all the other
virtuoso developers out there.. these guys will make THE difference
for ATARI. POINT: "ATARI.. hurry up .. and get the TT out here!"
Unfortunately, timing IS a factor in the industry!

As much as i complain about the marketing of ATARI etc.. i still am
a number one fan... encouraging people daily to look into the ST line.
I want ATARI to succeed. Hopefully, the new ATARI marketing group
can put ATARI in its rightful place.

3604. Again: AC-Fortran and Erlgraph

Newsgroup: comp.sys.atari.st
Date: 1989-12-03 20:11:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <891203201104.964118@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 246276

JOHNBARNES@ENH.NIST.GOV writes:

A collegue of mine has persuaded me to try Prospero Fortran because
it supports libraries from mixed languages. Prospero C and Prospero...

It is not too difficult to do mixed language programming with Absoft
Fortran. Since both the dynamic and the static linker can use files in
ST executable format You only have to run the foreign object files
through the corresponding linker to transfer their format to that of an
ST executable. Then You can use it with the Absoft linker or link it
dynamically. I've don this with some routines written for the Turbo (C)
Assembler which produces objects in DRI format. I am not quite sure but
I remember having succeeded also with GNU objects. My question toward
mixed language programming aimed more toward using someting else
together with GNU C.

I don't know whether you have invesigated Prospero Fortran or not. If
anyone has had contrary experience I would hope that they would speak
up.

I've heared that Prospero also has difficulties with that huge amount of
routines. Anyway, the job is possible with both compilers. I've seen
ports of early versions of the package for both.

Could you please describe Erlgraph? I am keenly interested in a good
FORTRAN graphics package and I might be willing to help with
development and/or testing.

Erlgraph is a set of graphics routines written in Fortran. It is
intended for people writing their own graphical applications on batch
oriented mainframes. It has been developed at the University of
Erlangen, West Germany, on a Cyber running NOS. It is quite comfortable
to use but there are more powerful (and more expensive) products on the
market. It is distributed as a commercial product. Should be not cheap.
As a consequence, I can't give away the thing although I really would
like to do so. Sorry.
We have got a sublicence of our computer center's licence free of
charge and port it to our machines since the computer center has only
the VAX, Multics, and PC versions. A version for the ST is available,
written for Prospero (side question: is Absoft still alive? Even the
german distributor has no information). But we don't want to buy a
second Fortran compiler for the ST especially since the Absoft produces
better code and the 68881 library of Prospero is completely overpriced
--- 200,- DM for a few simple routines doing mainly cpu/coprocessor
communication. I have written my own library for Absoft.

Date: 1989-12-04 01:45:18 UTC
From: chad@norge.enet.dec.com
Message-ID: <1746@hiatus.dec.com>
Source record: 246278

I also use NOTATOR. I have not seen FINALE myself in the flesh. While Notator's print outs look nice (I haven't lasered them yet...), from what I've heard/seen of Finale, it is the much better "music engraving" package.
Notator is more of a sequencer that allows pretty nice music notation and score print outs. It is the best in that category. But if your goal is to get the best looking stuff on paper without any realtime music playback and MIDI editing, Finale is the way to go. I base this comment on reviews I've read, my use of Notator, and conversing with people who use Finale and who have described its capabilities, as well as seeing output from Finale.

Basically, it is a apples/oranges comparison. Notator is a sequencer and MIDI editor with scoring. Finale is a scoring/engraving package with some MIDI input/MIDI manipulation.

Notator is however a great package. Highly recommended!!!

1. I have been reading alot of talk about this FORM program and people receiving the binaries for it. Where are people getting these binaries from? Can I get these files from bitnet? Are they at PANARTHEA?

2. I have TV Sports Football and it is GREAT!!!! I have a 1040ST and it loads and runs perfectly. This has got to be one of the best sports games I have ever played on a computer.

3. If you are into playing racing games, try out PowerDrome. It is a spaceship racing game that you race other spaceships on roller-coaster like courses. Very good/fast graphics.

4. Somebody mentioned a problem with DCFormat. Is this true? I format practically every disk using this program.

5. From what I read in ZMag about Comdex, I can't wait to get my hands on a TT, as I am getting bored waiting hours for RezRender to raytrace my pictures.

>I also use NOTATOR. I have not seen FINALE myself in the flesh. While
>Notator's print outs look nice (I haven't
>lasered them yet...), from what I've heard/seen of Finale, it is the
>much better "music engraving" package.

This is likely true.. as NOTATOR does not support a great
variety of fonts and symbols... BUT.. the update in
December and the one coming in Spring will allow
imported fonts.. and user defined symbols.. possibly
MIDI mapped dynamic symbols!!!!!!

>Notator is more of a sequencer that allows pretty nice music notation

>output from Finale.
>

Agreed.. NOTATOR could improve its "engraving quality" look..
and from what the developers tell me, they are doing just that.
(Must say that NOTATOR is good enough for two local symphonies
for clean and neat performance scores).

But a time factor has to enter into the equation.. otherwise you
may as well hire an expert copyist. Moving several windows deep
and backing yourself out to do an operation that takes only a single
click with NOTATOR slows the process down to a crawl. Then
there's the printing... an hour for a Finale PS page is prohibitive
when you are considering performance scores for a symphony amounting
to as many as 1200 pages! But what you say is true.. NOTATOR
started out as an awesome sequencer.. then added notation..
fortunately, the developers know the capability of the 68000 and
GEM and are doing an amazing job. Several people in the MAC and
IBM world say their software, including FINALE, pales in comparison
to NOTATOR. The new multi-tasking features of the update coming
in December will provide for even a greater creative environment.

I had this problem with two different ST mice, and a friend gave me this suggestion (from his own experience): Put several layers of paper between the plastic "arm" of the button and the actual switch.

Depending on the seriousness of the problem, different thicknesses of the paper work...but when I did this, the problem completely vanished for several months. (until a "friend" played a game on it REAL hard, and I had to replace the paper--it works again, though).

If it doesn't work--well, you can't complain about the cost, right?

This isn't a bug in Uniterm's Kermit, but I have had a problem with Kermit sending a false short break signal when keys on the let side of the keyboard are left-shifted. On a DECserver that interprets a break as an untrappable logoff, this can be a major problem. Anyone else who has experienced this problem, please send email. If I'm not unique in this, I'll post a summary.

>
>Bob Marley

I second all of the above! Stunt Car Racer is the best game I have ever seen on the ST! The author, Geoff Crammond, used to write some of the most amazing games for the BBC Micro (Aviator - Best BBC flight sim ever, Revs - Best driving game, Sentinel - Strange 3D power struggle). I have no connection with Geoff other than the fact that his brother used to work here. But that's not why I recommend Stunt Car Racer.

A game you should definately NOT buy is Hard Drivin'. It's a piece of *&%$! Only the graphics are the same as the original. It's slow, buggy and a complete insult to the capabilities of the ST. I guess that's why Domark were only showing on TT's at the recent computer shows. You get a big stoopid plastic box with a disk, a badge and a sticker in it.

Anyone played VET yet?

3615. About a shareware 'Aladin'.

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 09:33:00 UTC
From: PRINS@HLERUL5.BITNET
Message-ID: <8912050801.AA12489@ucbvax.Berkeley.EDU>
Source record: 246287

>1) Do you think there is a market for such an emulator? I could release
> this version before Christmas.
>2) Has anybody made experiences with sending shareware fees to Germany?
>
>Thanks in advance, Pit

Being a registered Aladin V3.0 owner, I have got some mixed feelings about this.
I like the Aladin, and would like to see support continued, but through a real
distributor, with real support. If there is no way to find a distributor who
is willing to market your product, I suppose a shareware solution with less
support would be acceptable as a last resort. I would like to see new Aladin
developments, and if this is the only way, then It's OK I suppose.
I am also owner of the product That's Multyformat (if you mean that product
with your Mac to Aladin converter) also known in the USA as the Discovery
Cartridge.
Please keep in mind that a lot of people at least have had confidence in your
products; please provide an upgrade path for them.
I don't have experience with sending shareware fees; within Europe, I suppose
it won't be a problem. Just use your bank account number.

Greetings, Ryko Prins.

Concerning the format of the form.dvi file:

It is a great paper saver if you happen to use civilized
paper sizes. The size is A5. Two A5 pages make one A4 sheet.
(Napoleon thought this out:
A0 has a surface of 1 m^2 and the ratio's are 1/sqrt(2)).
With some experimenting you can probably also put two A5
pages on a letter size page.

Now what is inclusive speech? Should I have written the manual
in fortran?

This problem hit me too, when I received my chips via mail, all I got
was the 6 chips. Don't pay any attention to the L&H numbers, there are
other numbers on the chip, that read in ascending order. There are
equivalent numbers on the roms that are already on the 1.0 roms. You need
to put the new eproms in the same ascending order. I can't remember
the exact pattern that resulted of the L&H numbers, but was one of the
following on my 1040st.

H2 H1 H0
L2 L1 L0

or

H0 H1 H2
L0 L1 L2

3630. Re: Shareware Mac

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 15:10:26 UTC
From: capit@peun11.uucp
Message-ID: <705@nixpbe.UUCP>
Source record: 246152

Hi, I'm the one who offered the Shareware Emulator. Our backbone in
the US was out of order for the last weeks, so I missed the beginning of
this debate. But now we are back, and I have some comments on various
articles. I didn't include copies of all statements because of the length
of the article.

> I'm sorry for posting this here but my reply to the 'sender' just bounced.

This may be due to the problems with our backbone. But I received mail
only from Europe yet. Could someone please try to mail again to check the
connection?

> The effort could be better expended. Let's face it: it's hard to
> write an emulator like this. It's taken Dave Small a long time to get
> his working as well as it does.

If I had to start from scratch, it would be very hard work, indeed. But as
I mentioned in my first letter, the emulator is ready. It has been on the
market in Europe since 1987. The only thing I have to do is to re-develop
some utilities around the emulator, which haven't been written by myself.
(For example tools for configuring the emulator, transferring software from
the Mac to the ST, and so on...)

> You should not go out and write a share-ware version of someone's
> package IF you are *worried* about hurting their business. My point is that,
> given the very small size of the ST market, we *should* be worried about
> GBS's future. I'm not saying that it is morally wrong to write a shareware
> Mac emulator; I'm just saying that writing it will hurt GBS, and given
> the small size of GBS and the quality of their products, it is not in any
> ST user's interests to hurt them.

I was very surprised about how much you were concerned with the future of
GBS (with respect to the shareware emulator, of course). I'd really like to
see any comments from Dave Small on the whole topic. In the past, he hasn't
been too shy to comment on Aladin...
Besides: I'm a small (one-man-part-time-)"company" too.

> Yes, I'm sure there would be interest in a good shareware MAC emulator..
> But Dave Small has established the standards here for what a MAC emulator
> should do, and how it should perform...
> (Playing "Devil's Advocate",) do you think you can compete with the Spectre
> Mac emulator..?

As I said in my first letter, I know the emulator I'm offering is not
state-of-the-art, because it supports only the 64K Roms and it can't read
Original Mac Disks. Otherwise, it would be shareware. I think there
wouldn't be much harm to Spectre GCR. But again, I'd like to hear from

Dave.

> So, YES I will support the ALADIN, for the reasons I stated above,
> because I've seen an earlier ALADIN version running, and because
> Germans have proved they love the ST and their software is almost
> perfect (Tempus, Modula-2,LABEL-EXPRESS)

Although the shareware emulator IS the emulator of the ALADIN product, it
will be named different.

> In order not to violate Apple's copyrights, ROMS must be made available
> for this guy by way of a cartridge.

Correct. You'll have to get the ROMs on a cartridge to be able to use the
emulator. (See my first letter.)

> In fairness to David Small and as an obvious business move, don't make the
> cartridge steal his thunder. (His software has checks to make sure the ROMS
> are in one of his cartridges and aren't EPROMS. Making a cartridge to get
> around this like the Discovery cartridge tries to results only in OUTRIGHT
> PIRACY of his software for use with the alternate cartridge. Also, if the
> cartridge is compatible, VIRTUALLY NO ONE WILL EVER USE THE SHAREWARE
> SOFTWARE OR PAY THE FEE: they'll just use his software and hurt his business
> AND yours.)

I'm absolutely not planning to pirate anybody's software!!! The emulator
will not allow anybody to run Spectre without the Spectre's cartridge!!!
This is a product totally of its own, developed by myself without ever
looking at any code of Dave Small! (I prefer my own and Apple's code.)

> Spectre is reasonably priced and therefore a shareware version is not
> going to be particularly competitive and therefore should be expected
> to be poorly maintained. Thus substituting a poor piece of work for a
> good piece of work.

Have you ever seen or heard of ALADIN? How can you talk about it as
"a poor piece of work" ???

> The only way that "small" enters the picture is that a small business is
> less able to afford to defend itself against predatory behavior.

That's exactly why the German company isn't selling ALADIN any more: because
they couldn't afford defending themselves against Apple Germany. The trials
would have been too expensive.

> According to press reports, the Aladin system included illegal copies of
> the Macintosh ROMs, and Apple shot the product down. The developers have
> every right to convert their work into a legal product which Apple has no
> way to affect. DAVID SMALL HAD TO DO THIS! Early versions of the Magic Sac
> project were altered so that only legal Mac ROMs could be used, and the

> certainly stomp.
> ...
> From published reports, he WAS not pleased with the Discovery cartridge
> "feature", nor with the nature of Aladin's competition (since they used
> on-disk copies of the ROMs and he couldn't).

We NEVER used on-disk copies of the Roms! I don't know which press you're reading and where they get their information from, but your's is certainly false!
There were two trials against Aladin (1987 and 1989). In both trials Apple Germany went to the judge with ridiculous "facts" about Aladin and the Mac. Did you know, for example, that the "Finder" is responsible for the User Interface of the Mac, because it's the software, which draws windows, dialog boxes etc...? Apple Germany used informations of this kind in the court. But - again - we just couldn't afford the trials. The sum in dispute has been 3,000,000 DM.
There was a pirated version of Aladin in 1987, which had the Roms on disk. (There have been pirated versions of Magic Sac and Spectre 1.75 too.)
But certainly it wasn't we who pirated our own software. Since then, Aladin hasn't been pirated anymore because of a new copy protection scheme.

Is it true, that Dave Small has got troubles with Apple USA? If so, I'd like to know more about it (sorry Dave, asking you again).

>
The above statement about the ST2 not being able to be expanded to 4 Megs
is absolute CRAP. I know of about 20 ST2's that have been expanded to 4 Megs.

To Richard directly: Please have the guts to flame me by mail, don't waste
space here!

> Oh well, life goes on.

I guess it does ...

I was recently in one of my local (non-authorized) Atari dealers when I
noticed that he had an Atari product called VT100 Emulator. It was a cart
that you plugged in so your screen resembled those old VT100 terminals that
astronomy people use :-). Has anyone used it. It was only 10$ so I might
go back and purchase it just fo rthe heck of it. Do I have to be hardwired to
the system I want to use, or can I use Flash! or something.

In speaking about Flash!, I would like to ask the authors of Shadow if they
consulted the authors of Flash! before or during the construction of thier fine
program. No flames here, just interested in the development process.

Finally, I would like to share a bedtime story with y'all. The same
un-authorized Atari dealer I mentioned above, warned me that they might soon
be ending thier (limited) Atari support. "Not selling enough units", he said.
It should be mentioned here that he also sells PC's and Amiga's.

"How many ST's did you sell last month", I said?

"Oh, about (pause), twenty", he said.

"And how many PC's in that peroid", I enquired?

"(Long pause, and a search of the records), one", he admitted.

"Hmmm", I grined. "And how many Sega game systems"?

"(Easy one I guess), Ten in the last week", he blurted.

Conclusions; there is no doubt that this dealer has low prices, but he is only interested in the quick sale. If you could see his store you would see racks and racks of games for the Amiga, ST, Mac(?), and PC's. Atari people are smart enough to buy at the lowest price, but go to the authorized dealer for their software support, games for the ST just aren't cutting it for this guy. I mean save for a few wordprocessors and this VT100 emulator (which was a mile deep in dust), he has games. My point? Don't underestimate the need for serious support in software for the Atari user. The authorized dealer can't keep Calamus in stock, this other guy hasn't even heard of it...

Go ahead and try...I'll see you in a few years.

The Apple ROMS are the result of several hundred person-years of work,
and you expect one enterprising hacker to recode them, and do all
of the testing and revising to ensure even a reasonable amount of
compatibilty? Obviously you've never developed software for a living.

3633. Spreadsheet or Finance Package?

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 15:35:20 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4751@blake.acs.washington.edu>
Source record: 246155

I am hoping somebody can help me make a decision.

My father-in-law would like me to put his
apartment managing business/accounts on the ST.
I think there are 25-30 some odd units involved.

Realizing the differences between a spreadsheet and
a business-finance package like Phasar or something..
what format would serve best to keep track of
apartment income vs. apartment expenses.. and then
be able to handle taxes at the end of the year with
little effort? He is approaching 70 years, a program
that doesn't take too long to learn and implement
would be best for him. His set-up is a 1 meg 1040ST with
a 50 meg Seagate 157N. Both mono and color.

Suggestions for programs?

Thanks in advance.

3634. GNU C Floating Point Math

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 16:30:59 UTC
From: esp_05@jhunix.HCF.JHU.EDU
Message-ID: <3497@jhunix.HCF.JHU.EDU>
Source record: 246156

Does anyone have any experience with GNU C and using floating point
math? From my brief experiences of trying to write some 3D animation
in GNU C (or should I say my brief run-in with GNU C) I have uncovered
an unreasonably large number of errors in the floating point handling.
Admittedly, a number of them cleared up when I stopped using -mshort,
even though I used -lpml16 whenever I used -mshort.

Some of the errors include:
cos(0) doesn't seem to work
(x*x)+(y*y) doesn't work when -1<y<0
sqrt() doesn't work (with -mshort only);
neither do related functions frexp and pow.

Any ideas or suggestions? After comparing GNU C with an ancient copy
of the original (c.1986) Megamax C, with Megamax C blowing GNU C away,
I'll probably get Laser C next month anyway.

Thanks, Eric

Could someone please repost the manual to FORM in ASCII?? I have it in the
DVI format and I don't have the proper DVI tools to convert it to
ASCII.

Other than that I haven't looked at FORM.

Does anyone know how to get DVI to work on an Apollo UNIX based workstation?

I don't have any files for my Apollo for DVI. If I could get DVI working on my
Apollo I would repost the manual in ASCII myself.

> REF: Spectre and AppleTalk
> I do not know what make it so difficult for Dave to make his Spectre
> works with AppleTalk. I am not a 'Software man' [...]

There is a real simple reason that the ST Mac emulators (Spectre, Magic Sac, and Aladin) don't support Appletalk, lack of proper hardware. Appletalk runs at 230,000 baud, the ST does not have a synchronous serial port that runs that fast. Without hardware support what is the point in working on the software support?

On several occasions Dave Small has said he will support Appletalk when there is hardware available to connect it. In the last 4 years at least 6 companies have either privately or publicly announced they were going to build Appletalk hardware, none of them have ever released any hardware. Most of them decided to drop the project since they didn't expect it to make enough money to pay back the R&D expenses. A couple of them may still be working on it.

I have no trouble at all with either text transfers or binary transfers
between Uniterm Kermit on my ST and C-Kermit running on a 4.3bsd system
(a Sun Sparcstation). You do have to remember to set binary mode at
both ends for binary transmissions. I usually say "kermit -ix" to the
Unix kermit, click the "binary" box on the Uniterm menu, and use the
"get" or "put" command.

I thought that request was a bit odd, too. I assume (I can't read the docs either; more below) that the original poster was objecting to the use of the genderless "he." Well, whether he likes it or not, that's the way English is. Substituting "he/she" (or "she/he") all over the place isn't a good solution.

>I have a different problem with the Form documentation: TeX. Seriously, is
>a 430-kilobyte DVI file an efficient method of distributing docs?
>Especially since the number of STs actually running TeX is mighty small.

Heck, I couldn't even print the thing out on my Sun. Distributing straight TeX documentation would be fine, as the TeX source is at least very human-readable, but DVI struck me as a bit silly as well. (If you're wondering why I posted it anyway, I have a hands-off policy about that sort of thing.) If someone has the software to convert the thing into PostScript, please mail me a copy. I don't have time to set up all the TeX stuff on my machine, and as Sun is a *roff house, nobody around me has it already.

>On a (sort of) related subject, does anybody else find the shar'ed source
>code in comp.sources.atari.st to be a constant source of trouble?
>UUDecoding a .ZOO file
>is *so* much simpler.

When I started moderating comp.sources.atari.st, I put all the sources in uuencoded arcfiles (check the early volume 1 entries on panarthea). I got about twenty complaints from people at various sites, demanding that I use shar instead for various reasons. Since that seemed to be what the public wanted, I switched over. Frankly, shar is often more of a pain for me, too, as (posting rules notwithstanding) sources are frequently sent to me as arc or zoo files, which I have to repack as sharfiles. (Such sources tend to sit in my queue for a while.)

What do people think? Should I switch back to uue'd sources?

Thanks for all your efforts on behalf of us stranded UK users, Ken.
I'm going to wait until after Christmas and then start asking Atari UK
about this again. Hopefully, by then dealers will have the TOS 1.4
ROMs and I won't have to start hassling.

Incidentally, the Stacy was given a big front-page review in the
December issue of the UK's leading micro mag, Personal Computer World,
so I expect to see real live Stacys very soon now. After all, the
same mag put the Atari CD-ROM player on its front page in December
1987 issue, so I expect the mag will have taken steps to ensure
they're not fooled again into reviewing prominently something that
wasn't released. (Surely?? Yes??)

Actually, with the new TOS 1.4, you should be even better off. TOS 1.4 can format, read, and write REAL IBM 3.5" and 5.25" floppies. So, transferring files to the Mega ST to be printed on the SLM804 should be a snap.
Don't you wish that you could hook the Mega ST up to your IBM PC network (LAN) though?? That would really enhance your use of the Mega ST4/SLM804.

> RE: Rich Covert, maybe it's YOU who has the problem and not Atari
You are 100% correct, I do have a problem with the SLM804. That is, I used to have a problem with it. Now I don't :-).

Well, first let me say that I sold my Atari SLM804 laser printer because of dissatification that I have had with it the last year. I don't want to rehash them here. Let me just say that the SLM804 is an EXCELLENT laser printer for ST only work. It is fast and is reasonable well supported by third party vendors (though not by Atari :-)). the SLM804 does not work well with pc ditto (or even pc ditto II), prints at only 144 dpi with Spectre 128 (unless you buy UltraScript), and doesn't have LaserJet or Epson emulators.

I bought my SLM804 in March 1988 for $995 from my local dealer. I would NOT have paid more for that printer. I am buying a Panasonic KX-P4450 laser printer for $1399 + $300 for the extra meg of RAM from a local store.
For the extra $700 I get the following features:

o Epson FX-286e emulator

o Diablo 630 emul.

o Panasonic 1092i emul.

o IBM Proprinter emul.

o HP Laser Jet Plus emul.

o 11 ppm print speed

o dual paper trays

o 1.5 megs of memory in the printer (freeing up one meg of
memory in the ST)

o Downloadable fonts, 4 fonts internal

o $35 toner carts every 5,000 pages

o $90 developer every 13,000 pages

o $189 laser drum every 20,000 pages

o Optional envelope paper tray, other sizes also available

Now, this printer is very well supported by Mac third party vendors.There
are a number of commerical printer drivers for Mac and the LaserJetplus.
There are plenty of printer drivers for the IBM and the Laserjet Plus.
There are plenty of GDOS drivers for the ST and the LaserJet Plus.
PageStream and Calamus support the LaserJetPlus.

Plus, there are all of those ST programs which require an Epson printer.
Now I will be able to use them with my laser printer. Heck, I could even
use the Epson printer drivers for the Mac.

I called IMAGEN and was told that UltraScript works fine with Laser Jet Plus
printers. So, there again, I am not losing anythin by buying the Panasonic
KXP4450 laser printer. And I don't need UltraScript to get 300 dpi printouts
in the Mac/Spectre mode. I can use the LaserJet Plus drivers.

All in all, the extra bucks that I am paying for the Panasonic laser printer
are well worth it to me. And I am getting a FASTER printer (11 ppm vs 8ppm of
the SLM804).

So, if your local ST store doesn't sell the SLM804 for less than $1700, than
you might want to consider the KXP4450.

To summarize, the SLM804 is an excellent laser printer for a very narrow
application (ST work). With the addition of UltraScript it is even better.
But, for a few dollars more (in my case a new SLM804 would cost $1300) you
can buy a more general purpose,faster, laser printer that will work with more
applications on the ST and will work with David Small's Spectre and even
with Bill Teal's pc ditto. Please look at other printers before buying the
Atari SLM804. You might be pleasantly surprised at the laser printer market.

I saw a 2 page ad for the Atari Portfolio in the TWA Airline magazine on
my flight from Phoenix to ST Louis on the 16th of November 1989.
It was probably the same ad as mentioned above.

Goes to show you that Atari CAN advertise if they want to. I guess the
ST just isn't worth advertising here in the States :-).

3645. Versaterm PRO correction

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 19:27:17 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8912050803.AA12998@ucbvax.Berkeley.EDU>
Source record: 246167

Recently, Greg Csullog wrote that Versaterm PRO (Mac terminal emulation software) does not support kermit server mode. This is WRONG. I am using Versaterm PRO version 3.0.2 and it does support server mode. To enable it, select "Kermit options" in the "Settings" pulldown menu. A new option would then be available under the "File" menu to use the server mode, "Kermit Server".

I haven't used all versions of Versaterm PRO so I don't know if this is available in all versions. Obviously, neither has Greg. Please check your facts before you make a general statement like that. Uniterm is a great terminal software. One does not need to put down other software to make it look good. I've used Uniterm for the last 6 months with great pleasure. I just started using Versaterm PRO on a Mac IIci and am also satisfied with it.

3647. How to e-mail to authors of Sozobon

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 19:30:52 UTC
From: mj@myrias.com
Message-ID: <628803053.3843@myrias.com>
Source record: 246169

Not so long time ago Michael Vishchers (michaelv@watzman.UUCP)
asked how to contact authors of Sozobon C compiler. Since I
cannot reach him, and since more people can be interested
in an answer, here it goes:

So far I was successful writing to Johann Ruegg using the following
address:
uunet!isis!onecom!wldrdg!hans or uunet!dunike!onecom!wldrdg!hans
A new address for Tony Andrews is:
...onecom!raid5!tony

Please note that isis seems te be really touchy and likes to bounce
back your mail. In particular on a form 'wldrdg.ether.com', which
will likely appear in your mail **incoming** from Sozobon, will
react with "550 wldrdg.ether.com!onecom!hans... Host unknown".
This implies that you cannot user a 'reply' function of your mailer.

If you still have problems reaching addresses above then, as long
a volume is reasonable, you may send your mail to me and I will
do my best to pass it through. I seem to have a pretty good record
in that department. :-)

Michal Jaegermann
Myrias Research Corporation
Edmonton, Alberta, CANADA
mj@myrias.COM
...{uunet,alberta}!myrias!mj

P.S. If you are asking for a response on your posting, and you are
on a uucp site, please include in your message not only domain address
but also some sane "bang path" which works. Trying to guess it is
often no good and one gets back the following:

----- Transcript of session follows -----
While talking to unido.informatik.uni-dortmund.de:
>>> RCPT To:<michaelv@watzman.uucp>
<<< 554 <michaelv@watzman.uucp>... host or domain unknown
554 watzman!michaelv... Service unavailable

or variants of thereof.

I don't know about the HP Laser Jet IIp, but I hust ordered a Panasonic
KX-P4450 Laser Partner from a mail order place in Santa Cruz CA. It came to
$1642 with COD,shipping,the 1 megabyte memory upgrade, and a 12 foot Centronics
parallel printer cable. And yes, UltraScript ST-1 is supposed to work with the
KC-P4450 since it has Laser Jet Plus emulation.

BTW, Panasonic has a toll free techincal support number. It is

1-800-222-0582

I am going to call them and ask how hard it is to write a printer driver
for the 4450.

All in all, for the price seems like quite a deal!!

3649. 1040st sound problem

Newsgroup: comp.sys.atari.st
Date: 1989-12-04 20:09:50 UTC
From: jcromwel@umabco.UUCP
Message-ID: <849@umabco.UUCP>
Source record: 246171

I have a 1040st that has recently developed problems playing digitized sound. It will play ordinary game sounds ok, but the streplay demo sounds scratchy and low. Music Studio also has problems. I want to fix this myself so what chip should I replace? I can get a sound chip, but I wanted to check if I'm looking at the right culprit. Thanks...

>
> -- thanks, Dave Small / Gadgets

Dave, I am happy to see you on Usenet.

I would like to ask you about Appletalk support. I don't need it personally
but I was in Computer Works last Saturday when a young woman came in looking
for a STacy. It seems that she wants to buy a STacy Spectre-GCR to take to
work. she has all kinds of Macs at work and wants to have a laptop/portable
Mac for use at her home. Hence, she wanted to buy a STacy. When Jeff (the
store manager) demoed your Spectre (1.9f I believe) she was sold. Unfortunately,
CW didn't have any STacys or Spectre-GCRs in stock (:-)), so she left
empty handed. I tried to sell her on a 1040ST with a Spectre but she really wanted
a STacy Spectre-GCR.

Anyway, the gist is that she wanted to be able to hook up the STacy to the
Appletalk network at her job. Jeff said that you couldn't do that.

So, it would be a big asset if you could figure out how to add Attletalk to
Spectre-GCR by the time the STacys are available. Heck, I might even buy one
if you could get Appletalk to work (we have Macs all over the place at work!).

Well, good luck with the Spectre.

P.S. When will Henry at CW get more GCRs in?? I asked him to hold one for me.

P.P.S. I just ordered my Panasonic Laser Partner. I will let you know how it
works with my Spectre 128 (I still have an old set of SW, pre-19f I believe).

From article <9911@saturn.ucsc.edu>, by dstr012@ucscg.UCSC.EDU (10003012):
> Does anyone out there have or know where I can get a program to change
> the Trash and file cabinet icons on the desktop? The old desktop is getting
> pretty boring and I am due for a change. Thanks.
>
> Roman Baker

1) Buy Neodesk, you get all sorts of icons, lose ~$40 and at least 21K ram.
However, is much the best idea.

2) Just want to change the icons mentioned? Buy an old START magazine disk
off of Antic for ~$11 (you'll have to figure out which issue, my copies
are at home). Antic will also photocopy the article for you, if you
ask (you might have to pay for that also). The program is Alex Leavon's
Icon Editor. It comes with replacement icons (ugh!), which can be
loaded on boot up. Some nicer ones were available on Genie. I could
send the better ones to you (little 3.5 disks, etc.) but it is an editor
- go to it.

Bob Pegram (pegram@griffin.uvm-gen.uvm.edu - that's U. of Vt.)

3655. ZOO - mni tnx. Now another question abt GULAAM.

Newsgroup: comp.sys.atari.st

From: werner@vax1.informatik.fh-regensburg.dbp.DE
Message-ID: <31
Source record: 246177

Dear netlanders. Many thanks to all of you sending me messages about where and how to get ZOO. Ok, I received ZOO and while you're reading this, I'll start trying it out.
But now another question (fascinated by the fast answers): does anybody know about a new (or: the newest) version of GULAAM? That's an UNIX-like shell for the ST and I simply *LOVE* it. Filename completion, cmd buffering and the built-in uEmacs and terminal emulator - just the sort of things I need.
My version (sri, didn't look at the version number - gettin' old...) is abt 2 years old and throws BOMBs when I use the MEM command (BTW: thank you, ATARI, for the nice built-in symbolic debugger. It knows only one symbol (BOMB), but that's a very clear way to show a bug, hehehe).
If anybody happens to know about a new souped-up version of GULAAM, please drop me a few lines.

Thank you for reading this stuff. Ralf.

Message-ID: <8912050802.AA12717@ucbvax.Berkeley.EDU>
Source record: 246178

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Question.

(This is probably a really silly one to any C wizards, but I'm only a BASIC wizard!)

Why wont Sozobon, Lattice or any other C compiler I've tried compile the following, from K&R?

```
main()
$
char fred[] = "Some string constant";
<rest of routine>
```

This has been confusing me for a while, as K&R (surely correct!) would seem to indicate that this is indeed permissible!

Your observations would be very much appreciated! Please reply to the net as the mailer I'm forced to use is _MEGA_ brain damaged!! :-(

I understand that the user ends up paying only about $25 for the PS part
of the printer. I'd guess that most of the extra lettuce goes to pay for
the RAM and 35 (or so) fonts. That is probably why US costs whatever it
costs...

>> Thus, UltraScript is not likely to drop in price.
>> Can anyone confirm this?
>> ___ Stephen F. White, esq. standard_disclaimer()
>
>I thought PostScript was or is becoming PD?
>
>Ed June

The PS standard is out there for anyone to emulate; it's in the "red-book"
from Adobe. What is missing though is stuff called "Type 1" font support.
Type 1 fonts make small characters readable on low rez (300 dpi) printers.
Obviously, this is one way that Adobe is keeping one step ahead of the
emulators.

The only PD PS I can think of off hand is Ghostscript from the GNU project.
Ghostscript is a PS screen previewer.

ST Software for sale (only some items have the original boxes (I normally hate saving boxes - they take up too much space) but all items come with original disks and docs of course):

Archipelagos 9
Space Harrier 10
Barbarian 9
Brataccas 8
Marble Madness 10
Road Runner 8
Garfield 8
Better Dead Than Alien 10
Daily Double Horseracing 10
Zany Golf 12
Rogue 8
Passing Shot 12
Menace 12
Bubble Ghost 10
Vampire's Empire 10
Space Station 8
Little Computer People 8
Batman 12
Heroes of the Lance 12
Typesetter 8

Most of the following should have the original boxes as well:

War in Middle Earth 15
The Hunt for Red October 15
International Soccer 8
Universal Military Simulator 13
Legend of the Sword 10
Wargame Construction Set 13
Roadwar 2000 10
Fire Zone 13
Paladin 13
Elite 15
Warship 15
Red Lightning 15
Global Commander 13

daniel@pkmab.se (Daniel Deimert) writes:
| I can assure you -- you won't be able
| to sell a lot of computers if you don't tell them how to program it!

I seriously doubt that the _majority_ of people who buy Atari computers, or any other computers for that matter, have the slightest desire to program their machines. The simple fact is, most people who buy computers want to _use_ their computers. They don't want to be bothered with "programming" the things. Where a computer company will lose is if there is no software available for the computers. It is important to make sure that professional programmers know how to program the computers, not end users.

| [...] it must be possible to post a minimum of information to some
| knowledgeable people in the right places.

Who is "knowledgeable"? What is "the right place"? How much information is "a minimum"?
And what do you call the information we have been posting?
Chopped liver?

| And there're a lot of developers on the net, too.

In fact, only a tiny percentage of commercial ST developers are active on the net.

| And people from the net DO forward things to the right places.

It's true that net.info gets spread around quite a bit. It's also true that it gets warped on the way out. People are misquoted. The information may be wrongly interpreted at the far end, with no chance of the person(s) responsible for the original post to clear up the mistakes.

[interesting chain letter analogy deleted]

| It should at least be "cost effective" to give this information to
| developers without them having to ask!

Registered developers get a lot of information without having to ask anything more than "Where's my developer kit?"

| Why should I buy a computer I can't use? Like buying a car and when
| you ask for an explanation of the buttons getting the answer: "Sorry,
| you have to be a registred driver to get to know this. You shouldn't
| know about more than the gear and the wheel."

Why do so many people use this analogy? A computer is not a car.
A computer is a computer. But, since you insist, getting technical
information (on a level equivalent to "How do I program DMA sound?")
from an auto manufacturer isn't all that easy either. Try it some time.

| Have nobody thought of the possibility that there might be something
| wrong? Why should we otherwise be bashing Atari?

Okay, I'm donning my asbestos suit for this one, but here goes: I think
the reason that people bash Atari is BECAUSE THEY CAN. Because we are
active on the nets answering technical questions, people feel that
their input on how Atari should run its operation will be listened to.

WRONG. The nets are not the right forum for that kind of
communication. I pass on what I can to TPTB (The Powers That Be) at
Atari, but a lot more credence is (and should be!) placed in letters.
That's right, letters. On paper. Sent in envelopes. Becuause it's
all too easy to sit at your computer reading netnews, and fling a flame
into an electronic message thread without thinking too hard about it.
Most people think a little harder before putting something on paper and
mailing it.

| I have offered to help writing some demonstration programs to be put
| on the STE language disk. I haven't even got a reply. Atari Corp. was
| obviosly not interested.

This concerns me. To whom did you send the offer? Where did you send
your letter? Did you send an example program along with your offer?

| I do not want Atari Corp. to die [...]

Nor do I. I hope you are able to get the information you want to program
your STE soon. But remember, Atari gives registered developers special
treatment, and they deserve it, because they write the software that
sells Atari computers.

Hello all,

I discovered two really 'neat' things about and for Spectre GCR. The discoveries deal with graphics and a "work-around" for anyone having problems with the reading and writing to Macintosh diskettes.
If you have some great ST pictures in Degas format, you can convert them to .PICT pictures!!! Request the following from PANARTHEA:

volume8/depict Convert DEGAS .PI3 files to MacPaint

It was a shocker to me as to how easy and fast DEPICT works. All that remains is for the user to transfer it over to the 'Mac side' of his/her ST.
Using PICSWITCH .7, I've converted just about everything, including Amiga IFF pictures. The results have been great.
Ok, here is a simple work-around for Spectre GCRers who are having problems reading/writing Macintosh diskettes. The Mega that I am on has been so hacked to death due to a lightning strike a few years back that it radiates RF in a manner that would make Marconi proud. Hence, it has had problems writing and sometimes reading Macintosh diskettes. That is frustrating, especially when I see other Megas reading/writing Mac disks faster than real Macs. (Why me? Why always me??)
The solution is neat and fast, but it is a work-around. Take the Mac disk that you need to read or write to. Use Spectre GCR's Transverter program and do a conversion to a Spectre format diskette. That's it!
And....it is fast. Just like most people who are having problems with this, I never dreamed that Transverter could handle Mac diskettes. The only disadvantage is that the user will have to do his Macintosh disk I/O via Transverter. I never thought that Transverter could read/write to Macintosh diskettes when the GCR couldn't.
This opens a new world for me. I can use my years' worth of Tom Hudson pictures and volumes of Amiga pictures and convert them to the Mac side of my ST. I can now read and write to Mac disks.
What more could I want?

Applications generated with STOS seem to exhibit this same behavior.
I can verify that all programs I have tried which were created using
STOS and work with earlier ROMS cause the mouse to "lock-up" with
TOS 1.4.

A note on inclusive speech: "s/he," "he or she," "they," et al when referring to a single person of ambiguous sex are all incorrect in standard American English. I don't make the rules, I just quote them. Actually, I support them, as "he" is much less awkward than stylistic variants. There are some specialized styles, such as the American Psychological Association, which insist on "he or she," but otherwise this is incorrect.

And I don't think that these documents should require any TeX knowledge at all, aka a normal ASCII text version should also be included, as TeX really does require quite a bit of mastery, and uses quite a bit of computer resources.

>
>I am told by a colleague of mine who runs FINALE ... the much raved
>about notation package for the mac, that it can take as much as
>a FULL HOUR to print a SINGLE postscript page of music.
^^^^^^^^^^
I realize this is probably not the right forum for this, but here goes:
Over and over, I read people who point out how s l o w PS is.
Sometimes, they are justified; PS is pretty slow if it has too little RAM,
a very complex image, bad code, etc. But usually, people blame postscript
when the program generating the postscript is at fault.
Now, I don't know anything about Finale, but I don't think something
as simple as a page of music should take more than a few minutes to print
(yes, that _is_ slower than the SLM; heh heh). I suspect Finale is doing
one of two things: producing ugly, horrendous PS; or letting the printer
figure out how the page should be set and giving it just enough info to
let it grind the page out. I'd bet my mother that it's the former.

>Unfortunately, i still know people who are buying macs for music..
>While ATARI at this time has the upper hand in music sales...
>they could easily clean up if they put some effort into getting
>ATARI systems in the high schools and universities.. in studios etc..

I see lots of STs in music mag photos. They are pretty popular. But
there are not that many midi-ized musicians out there.

>for ATARI. POINT: "ATARI.. hurry up .. and get the TT out here!"
>Unfortunately, timing IS a factor in the industry!

Yes, I agree. And if you get the TT out there with an educational discount
and Unix, you might very well see a (somewhat) significant number of
university students taking out (even more) student loans to have Unix in
their rooms. (If the TT were in the $2.5k range, I'd get it, fast!)

Message-ID: <22194@brunix.UUCP>
Source record: 246188

I have two friends who both have SS drives and would like to upgrade to DS drives. One has an old SF 314 with a corner button eject and the other has a 520STfm.

1. What is a reliable and cheap DS drive to buy as a replacement? Netters have mentioned a Toshiba model several times.

2. Are there any hardware changes that need to be made? For example, if it can't normally recognize media changes.

3. What is a good price for that drive and suggested place to purchase from?

4. Any suggestions as to what to do with the old drive.

Thanks for you're kind attention.

BTW, one of these SS drive persons actually has the Atari color monitor with disk drive built it (PS 300 or PS 3000)!

>All in all, the extra bucks that I am paying for the Panasonic laser printer
>are well worth it to me. And I am getting a FASTER printer (11 ppm vs 8ppm of
>the SLM804).

You know, Richard, you don't listen.

I posted an article explaining WHY the SLM804 is sometimes faster than
other laser printers, even with faster print engines, in certain
situations. Several people posted articles saying, yes, in real life,
they have seen this.

I can assure you that, running Ultrascript, the SLM804 will beat the pants
of your Panasonic laser printer printing, for example, full page bitmaps.

Why don't you benchmark it in various situations before you shoot your
mouth off? Why can't you include a little disclaimer, "Well, there are
situations where the SLM804 is a lot faster than the Panasonic." Yes,
the Panasonic may be the best printer for you, but not necessarily for
everyone else. They might be very surprised to plug it in and find
that it doesn't print 11 pages per minute, every minute.

Your attitude is entirely non-professional. I hope you grow out of
your childish Atari-bashing phase.

The suggestion was made that instead of using a cartridge, code that works like the MAC ROMs but doesn't violate Apple's copyright could be used. This is a great idea. No one has done it yet, which is one of the reasons why no Apple clones (other than STs :-) exist yet.

It is a technical difficulty, or a legal one? How does Phoenix et al. get away with IBM clone ROMs? Licensing? Work-alike?

The clone chips cover only the BIOS part of the OS. Basically, all that
does is control access to resources (drives, video, etc). The rest of
the OS is available on disk from Microsoft.

The Mac is a different story: not only would you have to re-engineer
the basic stuff, you'd have to create the screen interface, event
management, and all that other stuff.

It's the difference between cloning BIOS and cloning Gemdos, the AES and
VDI.

3674. How random is Atari ST NH3?

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 00:21:03 UTC
From: bob@cmpfen.UUCP
Message-ID: <273@cmpfen.UUCP>
Source record: 246196
Cross-posted to: rec.games.hack,comp.sys.atari.st

I play NH3 on both an AT&T 3B1 and an Atari ST. My 3B1 NH3 is version
3.0e, and the ST version is the binary which was posted to the net.
When I play the Atari version, it seems that the creation of new items
is not entirely random, e.g., if I start with potions X and Y, and
rings A and B, then the odds are that I will find more of each of
these in the first level or two. This, of course, is fine if I start
with a scroll of genocide or a wand of death, but not especially
beneficial if I find more rings of hunger or potions of hallucination.
I don't observe this behavior in my 3B1 NH3. Is the Atari ST version
using a less than perfectly random number generator, or is this just
my imagination? Has anybody else observed this phenomenon?

Source record: 246197

Earlier, I posted a message about using DEPICT (I think that is
the name...I'm on the Spectre GCR and can't get to my ST side) to create
PICT files from Degas.PI3 files.
Here's something else that is pretty slick. Using SNAPSHOT.TOS, etc.,
take a picture of Dave Small's ABOUT SPECTRE graphic. Convert this to
a .PICT. Edit it with a suitable painting program on the Mac side of
your ST so that only the graphic exists. Now then, use this as a
startup screen via BACKDROP desk accessory. HEE HEE... funny seeing the
Spectre GCR EMULATOR picture on a Mac. The Macintosh Representative at
our campus 'demanded' to have one. He now has it as his startup screen on
his Macs.
Funny stuff...

I just received my second copy of gfa basic 3.07 (the one with the compiler and interrupter in one) that just will not load I mean no directory or nothing.
I get a " disk in drive A does not respond ....." message. Now my first thought is that my drive is bad, but I can access all my other disks with no prob.
I tried to look at the disks with Mich-trons disk utilities and it says basically that there are bad (and or no) fat sectors, whats a fat sector?. I would like to think that Antics more on the ball then to send two bad disks in a row, but I don't like to think that my systems on the blink.

Anyone else had any problems with Antic/GFA disks ?

Any ideas as to whats wrong ?

Source record: 246102

In response to Steve Yelvington:

ISD has ordered a large batch of Linotronic interface boxes from Germany. The first batch came in a long time ago, but none of them worked. The new ones should be in soon.

The boxes bypass postscript and send a raster image directly to the printer. They work with all Linotronic X00 models. Apparently, they are very fast. We have never stayed to watch them do the printing, but it takes only a couple of minutes for each page, from what I understand. A lot of printers have ordered the boxes, so it should not be too long before anyone can typeset their Calamus output.

The Compugraphic fonts look _great_ in 2540 (or whatever) dpi. I'm sorry I cannot give more technical details, but it's my spouse who's the layout artist - I'm just a philologist. If you call ISD at (416) 479-1880, they can give you a lot more specific information.

My local dealers can't keep ST's in stock.

I called J & R earlier today. I couldn't order an ST or
a Mega TODAY...that is, one couldn't go out the door TODAY..
The rep says they can't keep atari's stocked..
apparently the ad campaign is working. He said he has a
5000 piece shipment of ST's and Mega's and slm804's arriving
tomorrow... and if the phone keeps ringing as it has been..
he expects to sell them all!

What will it take to get the STacy and TT shown on the
cover of BYTE? There's hardly a concern demostrated by
BYTE people for a STacy and GCR whenever MAClones are discussed.
Is the PR problem at the Atari-end ?
.. or is it BYTE magazine?

I've noticed that no one (at least that I've seen) has mentioned their
ad in the Wall Street Journal for the Portfolio. I saw one earlier
(maybe September/October) which looked impressive. I like to see
Atari spread their name in ads *outside* the Atari world. Ads
in ST-Log and STart) don't make much sense since most of the
readers should already own an ST or whatever. Let others know
about Atari!

When I got into the scoring business, the only Atari notation package
around that generated PostScript files and could read MIDI files was Dr. T.'s
COPYIST. I can tell you this much: COPYIST generates about 250k of data
per page. The Sonata font (which, I'm sorry to say, is more aesthetically
pleasing than any of the Atari laser fonts I've seen) is another 75k. I print
my files out from my UNIX account, and they take about 10 minutes per page.
One thing that I have noticed is that pages with lots of slurs (which cannot,
I would imagine, be implemented by characters of the Sonata font) take up
considerably more memory than those without them.

> Now, I don't know anything about Finale, but I don't think something

I'm almost certain that my files are being transferred to the printer
by something niftier than the 9600-baud serial port that I've seen - and it
still takes 10 minutes. I've archived a few of my PostScript files and they
tend to compress by a factor of FOUR or FIVE. This suggests that there is a
fair amount of verbosity or redundancy in PostScript. Sure, it's great to
be able to read the stuff, but someone should consider the fact that a
protocol for the transfer of a ters, more compressed version of PostScript
would speed things up quite a bit. I'm not sure how inelegant the COPYIST
PostScript code is, but my guess is that it's not all that bad. At least,
it's about as ugly as the code that the FINALE user seems to be generating.

From: ehsnsr@JUPITER.NMT.EDU
Message-ID: <8912050326.AA10234@jupiter.nmt.edu>
Source record: 246108

Hi. Me again.

I have heard in circles that the Spectre GCR is faster than a 8MHz Mac Plus. Just how much faster is faster? I you can, maybe you could give me some benchmarks for comparison. Thanxs.

Also, I am thinking of trading my 520STfm up to an STE. I would like to keep my Mono monitor even though it shuts me out of some neat stuff. I know it has probably been posted before, but what are the improvements in the graphics on an STE? If the improvements are mostly just with colors, I'll keep the MONOmonitor. I really want 1meg, a DS/DD, and cool sound, so it sounds like the STE might be for me? BTW, How much does a STE cost?

I seem to remember something about Adobe putting PostScript into the public domain in an effort to retain control of the market due to stiff competition. If this is true (can anybody confirm this?), wouldn't that reduce the price of royalties to, like, zero?

I'm not sure if UltraScript even had to get a license for PostScript. It can be argued either way.

>(forster@cs.umass.edu / forster@umass.bitnet / david%cousteau@cs.umass.edu)

Well, Shanghai and Drachen both use the same game space and rules, so they
are identical simulations of something, but I don't think it is really
Maj-Jong. I believe 'real' Maj-Jong has more tiles, but I am not sure.
Being a big Shanghai/Drachen player, I would certainly like to know for sure,
so are there any Maj-Jong players out there? Fill us in!!

Oh, by the way, Shanghai works in mono too, but is even harder to play than
in color (which is saying something).

[text deleted]
>I'm not sure, but I think you can upgrade from MCC v3 to HiSoft v5 at a cost.

Is there any confirmation on this rummor?
I have spent a lot of time getting Lattice to be relatively bug free, and don't
wish to switch compilers now.

Does anyone have the address for HiSoft? Are they American, or de we have
to put up with the six week trans atlantic mail delay?

Last question: is HiSoft V5 an upgrade to lattice, or just a replacement? The
difference is obvious to those who have extensive private code libraries.

I have no idea why it eventually works with the retries set high enough, but
I have found that some UNIX kermits default to binary, and some to text. It
becomes important to specify [binay/text] on BOTH ends to get a valid transfer.

Some of the unix ports don't always switch properly between 7 and 8 bit modes
either. It's always best to match up before starting the transfer; after all
it is PD software and no-one is playing gaurdian.

>away with IBM clone ROMs? Licensing? Work-alike?
>

Work-alike.

But there is a big difference between PC-clone ROMs and Macintosh ROMs.
The PC-clone ROM is quite tiny, just a BIOS (Basic Input-Output System)
that allows the rest of MS-DOS to function. Macintosh ROMs provide a much
richer foundation for the portion of the Mac OS that comes on disk.

Recreating the functionality of the Mac ROMs would be quite a technical
achievement. If anyone solves the technical difficulty, though, they had
better be prepared for an ugly legal fight. Apple already has sued Digital
Research over GEM and Microsoft over Windows, and they're not even
Mac-compatible.

From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8912050801.AA12624@ucbvax.Berkeley.EDU>
Source record: 246118

Hello all,

What does the write-protect bit in the file attribute byte mean??

As most of you know there is a bit in the attribute byte that indicates READ-ONLY status when it's set. This means that the file can't be written to, can't be renamed or deleted.

BUT: I can change the time/date entry with Fgsdatim() (or whatever the GEMDOS function is called). Is this a bug or a feature?? Or is it necessary to enable the desktop to retain the time/date stamp while copying read-only files?

I can see advantages (for "make" type programs), but also some disadvantages. Comments invited.

REF: Shareware Aladin

In response to the above Ref, I think that there still a relatively large market for Pit's Shareware Aladin. For instant at the School of Architecture, National University of Singapore, I am teaching computer graphics course to the 1st Year (98 Students) and 4th year Computer Electives (15 Students) each year. One of the program I demonstrate in the classes is SCHEMA by Mark Van Norman (I bought from Harvard Graduate School of Design). Since we have only 5 ALadin (Version 1.3e) and 1 Magic Sac (Version 6.1) for student to use. The shareware will be inexpensive enough for each student to buy one for their own use. There are 20 Atari 520STs with 1MB EZ RAM upgraded and 6 Mega 4s for these 2 courses. I myself own 1 each of MagicSac 6.1, Spectre 128, Spectre GCR and Aladin 1.3e. Forget to mention that SCHEMA is a Mac 3D Modeling Prg selling to the Harvard's students at US$20.Please release your shareware quick,Regard.

REF: Message ID 5236@BGSUVAX.UUCP, The mouse switch.

I have changed the switch for my mouse. I bought 2 switches for about $0.25 each from a local electronic part dealer. Just looking for the one that has 4 pins and selecting the one that has softest action. Check it contact assignment with Ohm meter before replacement as not all of them have the same contact as the Atari mouse switch. I have to bend up 1 pin (not connect) and soldered only 3 pins to the pc board. It may require some filing of the button to adjust it to the correct height. Mac using micro switch for its mouse. I also found suitable size micro switch that could be used for Atari mouse but you will have to cut the stems underneath the mouse buttons. I am still not keen to do that yet. Micro switch is much higher than the square button type switchs used in the original Atari mouse. Althogh it has 4 pins connects to pc board but it is only on/off actions therefore the 2 pin Micro switch will work. Sujarittanonta

> One netter mentioned problems with UNITERM's Kermit. ...
> The ONLY Kermit I trust is UNITERM's so WHAT problems are there?

I can confirm that I do use UNITERM (2.0e) Kermit almost dayly in binary mode with the following counterparts : Vax-vms Kermit32, Vax-vms CKermit, IBM vm-cms Kermit, Sun unix Kermit and PC Kermit 2.32 . My Atari 1040ST is connected at 19.2 Kbps to an Ethernet pad (Bridge cs/100) with XON/XOFF protocol. The line to the IBM goes through the vax, then through a x.25 line to a central pad that connects me to the 3090 ... From experience, I have set the packet length to 1024 (reduced to 96 max by CKermit ...) and use the CRC for error detection. Depending on various conditions I get no errors or a few retries, but never got locked or with unreadable file (even a single error would be rejected by the dearcing programs). The mean transfer rate is almost 1KB/s with the Vax (780), while it's almost 4 times slower with the IBM due to the many intermediates nodes, but the error rate is similar. I found the 1KB packets giving the best throughput. A 2KB is even better, but only if the retries are very rare.

I never the less remember a discussion about a year ago (or more ?) between Simon Poole and ? concerning binary transmission. After reading all arguments, i was convinced that UNITERM worked the right way, although the documentation could have been interpreted differently. The fact that I never had any problem with the 5 different versions above confirms this 'experimentaly' I think (not a proof !)

regards and Thanks to Simon if he reads this ! Paul

3700. Re: Form Doc's

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 09:33:51 UTC
From: t68@nikhefh.nikhef.nl
Message-ID: <575@nikhefh.nikhef.nl>
Source record: 246123

Something more about the doc's of FORM.

1: The manual was written in TeX format because it looks nice
this way. It uses a customized macro package that was made
by someone else that makes for a very booklet format when
printed with two A5 pages on one A4 sheet in landscape
format. It has some more features that are quite handy.
The sources of the manual are nearly as long as the dvi
file and because the future versions of FORM will be
commercial it is considered bad policy to part with the
LaTeX file.
2: It would be quite hard to change the paper size anyway
because all examples are in verbatim and the size of the
lines in the verbatim is trimmed to the A5 page size.
It would look quite ugly with a different paper size.
3: I am preparing an article with a short description of
the syntax, some examples etc. for publication. If there
is a demand for it I can post the LaTeX sources of that
article. Be warned though that it will be much easier
to work with the manual. The manual is rather complete,
and contains a tutorial.

It should be possible to fit 2 A5 pages on one legal size page.

I am sorry that in a posting of yesterday I sounded rather
agitated about the paper size. There was somebody complaining
about paper size and the fact that I didn't use `user(m/f)' and
`he/she' everywhere, making the manual unreadable for everyone.
Considering the amount of work it was to type in nearly 400Kbytes
of text in a language that isn't my native language I think I'll
exclude people that complain like that from the licensing in the
future.

>
If you want to initialize an array (and a string IS an array of char) WITHIN
the body of a function (whether "main" or not), you should declare it as
"static" like in:

static char fred[] = "Some string constant";

Thus, the array will be static, i.e. memory will be allocated once at
compilation-time and initialization can be performed AT COMPILATION-time.
Otherwise, i.e. if not declared static, memory will be allocated each time
the function is called, and de-allocated each time the function ends, thus
discarding any value the array had previously.

3702. Sozobon C, PageStream, Magic, NRPS

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 11:00:00 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500076@uxa.cso.uiuc.edu>
Source record: 246125

To the authors of Sozobon: great job on version 1.2, when
is the final release coming?

I have finally deceiphered the format of PageStream files
and wrote (for a class) a magic (VLSI CAD SYSTEM) to PageStream
file converter if anyone is interested. This will allow
you to work on VLSI in a PageStream Document and port it...
(with limited error checking) or to include your VLSI documents
in PageStream documents.

I am going to start a graphing program that will output to
PageStream format files. I have not decided yet if I should
try to contact SoftLogic for possible marketing (GraphStream)
or release it as shareware... Anyone have any advice?

Has anyone done any reviews on products and sent them in to
a magazine? I would like to review Sozobon C and get the
message out that an excellent PD C is available.

To the requesters of Neodesk Random Picture Selector... It
is available at terminator (35.1.33.8) in atari/new/nrps.arc.
Version 2.0 is coming soon that will extract a random picture
from .zoo,.lzh or .arc files and use that. (getting sick of
all the space required for the pictures) If you can't access
terminator, get your request to me or let me know how to post
it to comp.binaries.atari.st.

3704. UniTerm 2.0e Dialer Bug fix

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 11:03:44 UTC
From: leilabd@syma.sussex.ac.uk
Message-ID: <1872@syma.sussex.ac.uk>
Source record: 246127

I have managed to dig out the fix that Simon Poole posted a while ago
for the dialer bug in UniTerm 2.0e. Here it is:
-------------------------snip,snip-------------------------------------
If the `Retries' filed in the dialer setup dialog is set to 0 or nothing,
the dialer can not be aborted. Fix by:

- setting `Retries' to one (this utilizes another bug, that the
number is actually the total number of tries),
or

- patch the 2.0e 004 executable:

Byte (decimal) 2.0e 004 005
44995 52 (Dec) (34 Hex) -> 53 (Dec) (35 Hex)
55917 87 (57) 93 (5D)

This will increase the edit number to five and fix both
bugs (`Retries' will really mean the number of retries
not the total number of tries).

Cross-posted to: comp.os.os9,comp.sys.atari.st

The port is from Wolfgang Ocker, Lochhausersstr. 32, 8039 Puchheim, West-Germany. The firm is called recco-ware.
The Version is sold only bundled with the C-Compiler, Basic09, Stylograph and the Sculptor database package. It comes with tools to access TOS files and some PD-stuff. The database is very nice and fast, and has anything,but an SQL interface. So it's quite up to date. (it runs under UNIX, VAX, MSDOS, ... too, so
really professional stuff).

This explains the price of 1598.- DM.

It will not run on the STacy, because the Screen-Hardware is different. The Drivers for the Harddisk will have to be changed also, because of the power consumption. You might phone Mr. Ocker to ask him, if he is doing the port or has already done it.

He sells also other nice OS9-Software and distributs the TOPS-Packet, if you send (8-10) disks and a properly stamped and adressed envelope.

3707. Spectre printing

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 12:08:37 UTC
From: efdirkx@vub.UUCP
Message-ID: <560@vub.UUCP>

Has anybody heard of a public domain printer driver for an Epson FX compatible printer that can run under Spectre128 ? I've tried "PrintWorks for the Mac", but that one generates a nice crash. It's great being able to run MSWord 4.0 and other recent MAC stuff, but my enthousiasm was gone very quickly when I tried to print without succes. I hope anyone can help me out.

That's not surprising, given that the Lynx was developed at Epyx, not
Atari, and all the Lynx designers also designed the Amiga.

Hi there,
at the moment i'm working with a VERSAdos machine. This supose to be
from motorola. The problem is i can only spend 4 hours on the machine
which is not enough. So can someone tell me how i can read VERSAdos
disks on my Atari, maybe someone wrote already a programm for it and
could send me this. Or if someone knows which format VERSAdos uses i
will write a programm myself. I could even post it to comp.sources.atari.st
if it works fine.

Thanxs for reading this.

[many good things about Ultrascript]

Possibly this question is of interest to others as well:
I've been reading "Ultrascript" ad nauseum for awhile now, so I might as well satisfy my curiosity. On the ST, is it resident & acting like a printer driver; or do you have to invoke it, point to a Postscript file and say "print that"? (I gather the latest/greatest version will fit on a 1meg machine, yes? So I assume this isn't a resident app...)

>go back and purchase it just fo rthe heck of it. Do I have to be hardwired to
>the system I want to use, or can I use Flash! or something.

yup. i've used it (once). the only reason i have two of these carts is that
i've desoldered the two roms on the cartridge and i can now experiment with
the cartridge port (ie: i can build whatever hardware i want and
hook it up to the empty sockets on these cartridges.) i did this for my
EE499 project at U of Waterloo. i removed the roms and replaced them with
the circuitry to allow up to 40kHz 12 bit sampling through the cartridge
port. worked really great.

while on the subject of cartridges: does ANYONE know of where you can get
** real ** prototype boards for the atari's cartridge port???? i've asked
this question a few times, but no-one ever seems to respond. not even
atari itself. i don't really feel like running out and buying a vt100
cart everytime i want to try some new hardware project on the st.

btw: are there any other official atari made cartridges like the vt100 cart???
(just wondering)

I can use tha ASCII docs to FORM as well.

Hey, it doesn't seem like many folks like the TeX docs to form.

Must be some form of Elitest mentatlity to post docs to a program
in a format that 99% of the people don't use.

Hey, if you are good enough you will have TeX, right? :-)

Oh well, it could have been done in nroff, which at least most UN*X
people have access to.

In article <1104890110363128@thelake.UUCP>, steve@thelake.UUCP (Steve Yelvington) writes:

Steve, if you want to pull individual statements out of context than most posts will look confusing. I was simply trying to point out how the KXP4450 laser printer is better suited, for *MY* application.

You see Steve, my point about the SLM804 is that for what it does, the SLM804 does EXCELLENTLY. but what it doesn't do, it fails miserably. For strictly ST work, the SLM804 is a great, but OVERpriced, laser printer. But, I wanted to use my laser printer, at a full 300 dpi, with my Spectre cartridge, which I can't do without resorting to buying the $500 UltraScript package (US plus its fonts). So, while it isn't Atari's fault that I can't print under Spectre, it is still a shortcoming. Also, the SLM804 doesn't emulate an Epson printer, so a lot of goofy little programs like AwardMaker won't print to the SLM804. My friend has tried using LaserBrain with the SLM804 since he bought theSLM from me. He reports that word processors fail when he tries to use specials features like italics or bold. So, LaserBrain doesn't emulate the Epson very well. And we all know about the buggy Diablo 630 emulator. so, I was simply getting tired of working around the defiencies of the SLM and when I had an oppportunity to sell my SLM I did. But, my experiences may be different from yours. My needs may be different from yours. And for strictly, narrow, ST work the SLM is great. The SLM is just not as versatile as say a HP Laser Jet or the Panasonic KXP4450. I *KNOW* that I can use my KXP4450 laser printer on a REAL Mac or a REAL IBM, so I canuse it with my Spectre and with pc ditto II straight away. You can't do that with a SLM804 printer.

As far as my waffling between *LIKING* the TT/p and *DISLIKING* the TT/p, I am still undecided. I LIKE my ST, but I really dislike the SLM804 laser printer. I like programming on my Mega ST much more than on a Mac, but I like some of the Mac programs that don't have equivalents on the ST. OK, I would like a computer whose software is as good as the Mac's but whose price was like an Atari. I do know that both the Mac and the ST beat *ANY* IBM PC that I have investigated. I dislike the MicroSoft WINDOWS for the PC and since UNIX/X Windows hasn't made it big in the PC world yet, it looks like either a Mac IICi or a NeXT or an Atari TT/x for me.

As far as the TT/p goes, I am expressing serious doubts about it based upon my 7 years plus experience with Atari products. And based upon first hand accounts from my friends who have used STs for years. The example I gave about the friend who bought my SLM804 and than couldn't get it to work on his *STOCK* 1040ST and Atari hard drive is typical of the problems faced every day by Atari ST owners. My friend has a 100% Atari ST system that wouldn't boot his Atari hard drive with the Atari SLM804 laser printer attached. He had to replace the ATARI hard drive interface with an ICD (Hurray for ICD, I own 2 of their fine host adpaters) Host Adapter in order to get his Atari hard drive to

boot with the Atari SLM804 laser printer. I won't have that problem with the Panasonic KXP4450 laser printer!

As far as the response to Ken B. from Atari goes, I was simply expressing the concern about the TT/p's expandability. If Atari has *NEVER* made an expandable computer in the past, and that is a true statement, than *WHY* should we expect the TT/p to be expandable. Heck, even the Mega ST2, the Business Computer from Atari, can't be expanded to 4 megabytes, according to Ken B. from Atari.

> Ieeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee!
>

>
> PS: If you would fix your postnews and/or install a .sig file with a valid
> mail address, maybe people would razz you without posting it to the entire
> flipping planet.

Steve, I did fix my .sig and now you can email to me directly. OK?

Folks, I am trying not to dwell on the negatives. I bought the KXP4450 simply so I could use more software (Mac, IBM, and ST) than I could with my SLM804. I don't know how well Atari will support the TT/p or even if it will be as described. I just *HOPE* that it is a little more expandable and reliable than the Megas or the other STs. I also hope that Atari does something to help both Atari Dealers and Atari USA magazines survive. I still like my MegaST4, and hope that the TT/x will persuade me to buy a TT. But, I have serious doubts, and it may well turn out that the ST will be the *LAST* Atari computer sold in the USA. Other computers have died, and there is no reason to believe that the Atari can't die either. So, I muddle along with my Mark Williams C compiler and my Flight Simulator!!

3716. Re: Shareware MAC

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 16:15:15 UTC
From: dlm@druwy.ATT.COM
Message-ID: <4476@druwy.ATT.COM>
Source record: 246139

in article <3395@brazos.Rice.edu>, bro@titan.rice.edu (Douglas Monk) says:
> The suggestion was made that instead of using a cartridge, code that works
> like the MAC ROMs but doesn't violate Apple's copyright could be used. This
> is a great idea. No one has done it yet, which is one of the reasons why no
> Apple clones (other than STs :-) exist yet.
^^^^^^^^^^^^^^ not true, there is an Amiga Mac emulator.

> It is a technical difficulty, or a legal one? How does Phoenix et al. get
> away with IBM clone ROMs? Licensing? Work-alike?

The problem is partly technical and partly legal (or at least
lots of money for lawyers).

To "legally clone" a BIOS (or ToolBox in Mac'ese) you need to
teams of programmers and some lawyers. The first team studies the code
to be duplicated and generates a highly detailed description of the
code. The description would include statements about register
contents, data structures passed, etc. for the various routines in the
BIOS. It then states what the routine does including any side effects
(eg. global variables that are changed). It should also document any
bugs in the code (ie. deviations from the published specifications for
the BIOS). This description is then sent to the lawyers who save copies
of everything (documentation for any suits that come up) and then send
a copy to the second programmer team. The second progammer team has to
be made up of people who have NEVER looked at the actual code to be
duplicated (ie. they never used a debugger to look at the Mac ROMs or
the IBM PC BIOS or whatever). They also can NOT talk to the first
programmer team except by having the lawyers forward messages (which
are filed just like everything else.) They then use the descriptions
to write routines that do the exact same thing as the original. They
may even clone the bugs, some of the 3rd party EGA cards for PC's have
the same bugs as IBM's EGA card.

When you get done you have what should be a legal duplicate of
the first program's functionality. There may be problems due to
copyrights on the visual appearance (look & feel) or patents on
algorithims, etc. Hopefully the documentation the lawyers have will be
enough to prove that you did things legally (Phoenix pulled it off with
BIOS ROMs for PC's).

The technical problems are really just time problems. The Mac
ROMs are very complex (much more complicated than the TOS ROMs for
instance). Given the large number of functions contained in the ROMs
it will take quite a while to duplicate them. And while they are
working to duplicate a given release of ROMs (eg. the 256K ROMs in the
Mac II) Apple will be working on new, improved ROMs with new features.

So when you get done you may have something that is already obsolete. This isn't a problem with cloning the BIOS ROMs in a PC, the functions of those ROMs is pretty stable with very few changes over time.

No company has decided that the time and expense (at least one year, at least 10 or 20 programmers, plus lawyers, and Apple will sue when you get done) is worth the expected return.

From: covertr@force.UUCP
Message-ID: <473f18ee.14a1f@force.UUCP>
Source record: 246140

I want to thank the following people for responding to my request about attracting new members to the Phoenix Atari Club:

Greg Lindahl
Robert Retelle from the Michigan Atari Computer Enthusiasts (MACE) club
Keith Hedger : {...!}uunet!inmet!hedger hedger@inmet.inmet.com
Tim Northrup

The main points that they all said was to distribute flyers at my local Atari store. Some suggested a free Club disk with each ST purchase. Bob Retelle suggested registering the club with Bob Brodie at Atari. But, with the revolving door policy at Atari we would have to re-register the club every few months (:-)).

Our local ST sdealer doesn't have the room for us to hold our meetings in his store. So, we still need to find a better place to meet. The local community college wants $500 a day for a room, with a $500,000 insurance policy. So, we can't meet there. My company has a great auditorium, but we can't let unescorted people into the building (don't want to let out our secrets :-)). We want to meet on Saturday mornings as that is the most conveneint time for our members.

I personally think that the we need a better, bigger, meeting place before we will attract new members. It is a Chicken and the Egg thing. We can't seat many more members in our current location, but without more members we can't afford a bigger meeting place.

While a "_majority_" of ST owners may not want to program their ST, every
ST owner I know of does at least some hacking.

> It is important to make sure that professional programmers know how to
> program the computers, not end users.

Sorry, you are way off base here. Most PD software comes from end-users
who in reality are "professional programmers" who don't wish/expect
to make a dime off of their efforts. BESIDES, aren't I (an end-user who uses
his ST to write programs for enjoyment) a valued customer????
Aren't my CUSTOMER needs important??? Your attitude really bothers me.

(Someone posted the suggestion that Atari follow Next's example when they
introduce the TT, and package GCC and utilities with each machine; that would
be a SMART move. I won't hold my breath...)

> However, is much the best idea.
[stuff deleted]

Double Click Software (us) is about to release a new product called DC DESKTOP. This AUTO folder program will *not* replace, but _enhance_ the GEM desktop so much, you won't believe your eyes!

You will get unique icons for eeach file, icons on the desktop (for quick execution), a 'cabinet' of programs (so you can store all your programs in one place), a printer spooler that works like a disk drive (drag the file to the printer icon on the desktop - or save to it from a file), replaces the desktop's _boring_ & _useless_ 'SHOW' command with a more powerful one, has a trashcan that acts like a trashcan (so you can 'undelete' files), PC 'XCOPY' type copy from the desktop, change the desktop to a picture or pattern, keystroke equivalents for desktop commands, and probably a few morefeatures I can't remember off hand!

All of this resides *in* memory, and is currently less than 30K!!! That's right, the program is less than 30K, and it does all this. You can use even less memory if you don't need all the features. Best of all, it stays in memory at all times (no more reloading or huge memory requirements), and it _enhances_ the GEM desktop, so everything still remains 100% compatible and the interface is just as you've always used, nothing new to remember.

Before you go calling us up wanting to order, let me just say that it goes into beta-testing this week. Release is estimated for Feb. 1990, and the retail price will be $39.95.

We will release specific info when it is released. (Oh yes, everything is written in 100% assembly language.)

3724. TDI Modula-2 Missing Pages

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 18:30:43 UTC
From: patrick@hpmcaa.mcm.hp.com
Message-ID: <760013@hpmcaa.mcm.hp.com>
Source record: 246147

When I purchased TDI Modula-2 my manual was missing pages 127-140.

I called the number in the front of the manual and it was disconnected.

TDI must be out of business?

Would somebody who has TDI Modula-2 be kind enough to copy the pages for
a few bucks?

I'm missing the Definition Modules for Storage,System, and Mathlib on the
pages above.

Please Reply to:
patrick@hpmcaa.mcm.hp.com

Thank You !!!

> Pardon me, but I have a copy of foldrxxx.prg that...How does one use it?

Rename FOLDRxxx.PRG such that you replace the xxx with a number. Then place the renamed program in your \auto folder. The number is the number of additional folders (above and beyond the 40 folder limit) you want memory allocated for. Examples:
FOLDR100.PRG Allows almost 140 folders TOTAL
FOLDR135.PRG Allows almost 175 folders
FOLDR400.PRG Allows a couple of large HD's :-)

What I do is keep xxx (the number) set to the TOTAL number of folders on all my hard drive partitions plus about 10 or 20. AND I count the number of folders (adjusting xxx accordingly) occasionaly. This leaves room for what ever folders might be on any floppies you have in the floppy drive and some room to create more folders on your HD.

> bytes. Does anyone know how to do this?!? Better yet, does anyone know
> of PD MIDI librarians?

A call to the XBios routine IoRec for device 2 (MIDI) will return a
pointer to the parameter block that contains all the information which
controls the buffering of input data. The first item is a long pointer
to the input buffer. So you set up your own area, then redirect the
input there by resetting that pointer. This is followed by a buffer
size word, which you need to set, then a pair of head and tail indices.
Setting them to the same value will 'empty' the input buffer.

When you're all done, you'll want to put things back the way they
were, before your program exits. Otherwise, you'll probably have a
nasty crash.

The above is from memory. If you need details, I can look up the
specifics.

As for PD MIDI librarians, there are things like STMIDIEX, but they
won't be useful with Roland gear due to their need for handshaking
and timing constraints.

>GEMDOS function is called). Is this a bug or a feature?? Or is it necessary
>to enable the desktop to retain the time/date stamp while copying read-only
>files?

Well, here's the logic behind it: setting the read-only bit means you
can't change the DATA IN THE FILE. You can still change the file's
directory entry, which includes its date and time. This is necessary
because you must be able to change the file's attribute byte, also in
the directory. If you couldn't do that, you couldn't ever
un-write-protect the file.

Alternatively, the answer is, "Because that's how Jason Loveman
implemented it."

It's not likely to change.

I believe what you need to do is to get into the setup mode and go into the telephone setup menu. Try changing the dial retry count to 3 or more, (the count should be at least more than one). Once you get back into the terminal screen and you encounter the same problem with the phone line, just hit the undo key and instead of quitting, which uniterm will ask of you, just type no. After that, you should be back on line.

Keith Groves

3729. Re: Help with Uniterm 2.0e

When Uniterm 2.0e refuses to dial a second number after the first one does (or doesn't) work, I just use the reset function from the pop-up menu, and all becomes well.

I agree with much of what is said, but with some modification. Until
very recently, I was using version 1.7b; it worked flawlessly in all
cases EXCEPT sending DEGAS format pictures to our VAX. Before I was
even aware of UNITERM, I purchased ANSIGRAPH; I have had no troubles
with its KERMIT at all. So, while I use UNITERM as my standard, I
changed to ANSIGRAPH for any long binaries. I have not
tried UNITERM 2.0e on a degas picture yet.

I just downloaded the copy of GNU C from terminator, oh, two weeks ago, the same time I downloaded the pml package. Maybe I should try drgsun.

At any rate Megamax C blew GNU C away in speed and executable size (GNU C took twice as long, and the executables were around twice as large). The only problem with it is that it doesn't have stdlib functions, although without those I can still improvise.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Let's just get nasty here!! :-)

OK Greg, in one of my last messages I *SAID* that for strictly ST work the SLM804 is faster than any other printer. That is because of the DMA port of course. I will give you that. OK? No more arguments?

>

> your childish Atari-bashing phase.
Real nasty mouth there!! :-)

> Greg Lindahl

Greg, I have said before that the MAJOR reason that I sold my SLM804 and bought a Panasonic KX-P4450 is that I wanted a laser printer that I could use with Spectre and pc dittoII at a full 300 dpi. The SLM804 can not print at 300 dpi with the Spectre now(disclaimer: Without UltraScript that it is), and can't even be used at at with pc ditto.

Greg, I bought my Panasonic because, given that I wanted a laser printer that emaulates a Laser Jet, the Panasonic KX-P4450 is the fastest laser printer for under $2,000.00. It is faster than the Packard-Bell (which sells for about $1200 with 1 meg, a real bargain), the HP Laser Jet IIP (which sells for about $995 with 1/2 meg), the HP Laser Jet II (which sells for about $1700 with 1/2 meg) or the Epson or the Brother or the Canon. OK?

I don't need to benchmark the SLM804 against these other laser printers, because they ALL will be slower than the SLM804 for ST work. I agree with that. But, the Panasonic KX-P4450 will be faster than the HP Laser Jet IIp,II, the Brother, the Canon, the Packard-Bell, or any other laser printer for under $2,000. I am *NOT* bashing Atari for the SLM804. It is a wonderful, though limited, printer. It just doesn't do what I wanted a laser printer to do. So, I am better off selling it than griping about its defiences. Agreed?

A friend of mine, Ralph Mariano, sells the Panasonic KX-P4450 printer and has used one with his Mega ST4 for 6 months. Ralph finally got an Atari SLM804 and it does run faster than the KX-P4450 for ST work. So, I agree with that. But, alot of people are buying Spectres and pc dittos and pc dittoIIs and pc speed. And those folks will find the SLM804 lacking. I had my SLM804 for 20 months and never could fully utilize it under Spectre or pc ditto. I don't expect Atari to address this anytime soon.

Did you know that *ALL* SLM804 emulators run in RAM that is overwritten by the MAC OS when running Spectre?? And by MSDOS when running pc ditto. So, even if Atari came out with a working Epson emulator for the SLM, it wouldn't run under Spectre or pc ditto without help from Dave Small or Bill Teal. And Atari has never even spoken about a Laser Jet emulator for the SLM. I wonder why? So, in order for me to use the SLM804 it would have needed an Epson emulator, and a Laser Jet emulator, but they would have had to be run in meory so that MAC and MSDOS could use them. Which is *NOT* very likely.

I refuse to defend my position anymore. I am happy with my choice to sell the SLM804. I will NOT say bad things about it in the future. I will learn to live with my SLOW (:-)) Panasonic KX-P4450 laser printer.

You, of course, must decide how you want to use a laser printer. If it is for strictly ST work than by all means buy the SLM804. But if you want to use it for Mac or MSDOS work, than consider another printer. OK?

Finally, did you know that there are PostScript clones out for both Mac and MSDOS. I was just at Egghead Software+ and saw an IBM PS clone from an outfit called LaserGo. It has PS plus 13 fonts. Also, there is Adobe Type Manager for the Mac, with the same PS clone and 13 fonts. Hey, guess what? Never supports the Atari laser printer. But both support the Panasonic KX-P4450. So, I don't have to use UltraScript to get PS for my Panasonic when using Mac or MSDOS programs. But the SLM804 eliminated this option from either MAC OR MSDOS.

So, unless Atari releases a laser printer with a cpu, internal memory, and builtin printer emulators, I am not interested in Atari laser printers. And than the Atari lp had better be cheaper than a HP or a Panasonic to compete.

Andrew, I was simply repeating what Ken B of Atari said in an earlier post.
That *SOME* Mega ST2s can NOT be upgraded to 4 megabytes. Also, when I had
Henry add the extra 2 megs of RAM chips to my early 1988 vintage Mega ST2 last
Spring I asked John Townsend and others at Atari what the repair/replacement
policy is for such machines. The *OFFICIAL* Atari policy is that a Mega ST2
that comes in for repair/replacement leaves with EXACTLY two megs of RAM
even if it came in with 4 megs. There is *NO* *OFFICIAL* way to upgrade a
Mega ST2 to 4 megs and still be supported by Atari. Ask John Townsend or
someone else at Atari if you don't believe me.

As far as some megas not being upgradable, my local dealer has sold some of
them. I believe my local dealer. On the other hand, the latest 520STs are
very easy to upgrade. You just add 1/4 RAM chips to bump to 1 meg, or 1 meg
RAM chips to bump to 2.5 megs. Very easy with the NEW 520STs. Very
UNOFFICIAL of course!!

>
> To Richard directly: Please have the guts to flame me by mail, don't waste

This is because STOS used absolute, undocumented memory locations for
mouse position. More's the pity, because a legal way of getting at
these variables _is_ documented. A couple of other software packages
exhibited this behaviour in Rainbow TOS testing here at Atari, as well.

I believe Antic has a new version of STOS that works better with Rainbow TOS.

Jan Ameij <AMEIJ%vax.oxford.ac.uk@NSFnet-Relay.AC.UK> mentioned that he had been having problems using Uniterm with VAX Kermit-32 when transfering binary files.

The problem is on VAX Kermit-32. If you select file type binary, it insists of changing the binary file's record length. As you have discovered, the fix is to set file type to fixed in Kermit-32 and set Uniterm's file type to binary.

3740. 3dbin/Matricks Doc

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 23:27:13 UTC
From: thamer@skiff.cis.ohio-state.edu
Message-ID: <74725@tut.cis.ohio-state.edu>
Source record: 246213

I downloaded the 3dbin archive from the graphics directory at panarthea,
and it's just what I'm looking for.
Although it comes with some basic documentation, the author said he
would post the complete atari-specific doc in comp.sources.misc.
Unfortunately, I've been unable to find it. I did find another
archive called matricks, (which is supposed to be the name of the
3dbin Doc also), but this is a different program.
Anyone been able to find this anywhere, if not, maybe I'll try
to track down the author?
By the way (on a side note), how do KILL files work? Some of
these groups get so big ~100 messages a day. Will this automatically
do some pre-processing/screening for me?

Thanks ...

Mustafa Thamer

RIGHT ! :-)
Seriously, TeX is available PD for just about everything (even
Mac's 'n VAX) and no expertise is required to run a previewer
like showdvi.prg (great PD - ware). ON THE SURFACE a dvi file
is no more prejudicial than uudecode, zoo, or arc. All of
these require finding and learning to get at the goodies on the
Net --- However there is a
problem with dvi files over submitting *.tex files. NOT ALL
SITES ARE CREATED EQUAL - the form.dvi uses magnified fonts
that some sites (like my ST and my SUN) don't have. Given the
source .tex file one could compensate.
TeX is ascii and can be read/reformatted without TeX
or hardly any skills.

So why send .tex? I printed the first 7 pages of form.dvi and
YES the author does use the EXCELLENT math typesetting
capabilities of TeX. - That makes it very useful to those with
access to the Net (and hence the PD tex stuff). [useful but not
essential perhaps- hey I only printed 7 of 250 pages].

BTW next week IF i can find the time and source for dvi-2-tty
I'll look in to making an ascii file for posting. Please no mail
no promises! Also please note that I have no idea what an ascii
version would look like wrt the math typesetting.

3742. VT100 emulator cartridge

Newsgroup: comp.sys.atari.st
Date: 1989-12-05 23:35:43 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8912061924.AA14975@ucbvax.Berkeley.EDU>
Source record: 246215

Andrew Semple wondered whether he should buy a VT100 emulator cartrige
that was collecting dusts in a dealer's shelf for $10. Don't. The dusts
alone should give a hint on how much demand there is for such a beast.
For free, you could get yourself a wonderful PD software, Uniterm 2.0e.
(Maybe $4 from PD disk archives). This not only does VT100 but also
Tektronics 4010, VT220 and other terminals.

Regards,
Marcelino Bernardo

>Hey, it doesn't seem like many folks like the TeX docs to form.

Yes, if only some of them said it politely, then they could get them in another form. However, if all we have is a doc in TeX, how else do you propose to distribute them?

>Must be some form of Elitest mentatlity to post docs to a program
>in a format that 99% of the people don't use.

Jos did you a FAVOR by translating these docs, and all you do is throw shit at him? How about "THANKS, JOS!!" for translating them in the first place?

>Oh well, it could have been done in nroff, which at least most UN*X
>people have access to.

If you have Unix, you can get TeX for free. If you have an ST, you can get TeX for free. If you ASKED, probably someone would gladly print you a copy of the FORM docs. If you throw shit on them, however, they might not want to do it...

>
You don't mention what version of GNU C you're using. The latest version
(1.36) is considerably better at floating point. The libraries are also
considerably improved. I don't use floating point much, so I don't know
how good the pml is, but I do know that the weird errors I used to get
with printf(), etc. are gone now.
>
> Any ideas or suggestions? After comparing GNU C with an ancient copy

I purged Laser C from my hard drive a while back. I found its libraries
very incomplete and somewhat buggy, and the compiler itself was frustrating.
It does have a nice math library, so if you're most concerned with floating
point it might be OK for you. If you do a lot of porting of code from Unix,
you might also want to look at Mark Williams C, which I hear is good.

> seem to indicate that this is indeed permissible!

NO NO NO

you can have char *fred[] = "hello";
or
char fred[] = {'h','e','l','l','o','\0'};

but not
char fred[] = "hello";

char *fred[] is an array of pointers, the first points to the string "hello"

char fred[] is an array of chars, 6 in my example.

3750. Atari image in USA / Europe

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 03:03:00 UTC
From: UI0T@DKAUNI2.BITNET
Message-ID: <"89-12-05-19:03:23.56*UI0T"@DKAUNI2.BITNET>
Source record: 246223

It never ceases to amaze me what kind of image Atari computers seem to have in the USA as opposed to here in Europe. As an example, there were several articles today in the Frankfurter Allgemeine Zeitung about personal computers (For non-German readers: The FAZ is about as serious and buisiness - oriented as newspapers in Germany ever get, which is quite a lot). One of these articles was about non - MS-DOS computers, i.e. the Amiga and the Atari. The conclusion was that the Amiga has an edge in games, the Atari in serious applications.

I know several buisinesses which run, for example, databases on their Ataris, because the software available is powerful and easy to use.

Strange, all in all...

>1. What is a reliable and cheap DS drive to buy as a replacement? Netters
> have mentioned a Toshiba model several times.

Toshiba is a good choice. There are others, but the Toshiba is widely
available, and as cheap as $68 or so.

>2. Are there any hardware changes that need to be made? For example, if
> it can't normally recognize media changes.

I really don't think so. The circuitry in both the external drive (the
PCB board) and in the STfm should take care of the media change problem.
If they do not, simply run a jumper between pins 2 and 28 of the drive's
34 pin card edge.

However, you might have a problem with the cables. Depending on where
the connectors on the new drive (with respect to the old one) are
located, you might have to wire up some cable extensions.

>3. What is a good price for that drive and suggested place to purchase
> from?

Pay no more than $85 or so for a Toshiba. Try to get an ND-354 or an
ND-352-A. The 352-A, if I remember correctly, only requires the +12V
line. If so, be sure to cut the +5V line coming from the circuit board.

>4. Any suggestions as to what to do with the old drive.

Use it as a doorstop? Seriously, just hold onto it. Never know when
you might need it.

> Thanks for you're kind attention.
>
> BTW, one of these SS drive persons actually has the Atari color monitor
>with disk drive built it (PS 300 or PS 3000)!

If you plan on upgrading that PS-3000, be sure that drive has PLENTY of
shielding around it. That CRT will play havoc on it.

>(Someone posted the suggestion that Atari follow Next's example when they
>introduce the TT, and package GCC and utilities with each machine; that would
>be a SMART move. I won't hold my breath...)

Actually, it seems kind of silly to me. MOST ST's don't have the memory
or disk needed to run GCC, and MOST ST buyers don't know C. NeXT puts
GCC with their machine because it's a workstation.

Can you only imagine the confusion of buyers who receive 10 disks of
software, with no instructions, that they have no idea how to use, and
that they probably don't have the resources to run?

Now what Atari ought to do is make sure we PD developers can purchase
reasonably-priced documentation somewhere. I don't need phone support,
but I sure could use docs. The ST docs eventually became available from
3rd party sources, but I'd like to see STe and TT docs before 1991...

3753. Once again: Seagate ST296N and Interleave 1:1

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 03:41:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <891206034145.728957@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 246226

Recently, I had the opportunity to attach a Seagate ST296N with ROM8 and Firmware 12 to my Supra host adaptor instead of my own 296 with ROM 8 and Firmware 11. Here the results I obtained with ICD's ratehd and quickdex 1.0. Driver software was Supra's version 3.30.

a) Interleave 1:1, 21.23 MB partition (d:), empty
ratehd: 20 ms, 57 k/s
quickdex: DMA: 509 %
Gemdos: 2486 %

b) Interleave 1:2, else same configuration as above
ratehd: 28 ms, 407 k/s
quickdex: DMA: 4290 %
Gemdos: 2463 %

c) Interleave 1:2, partition size 14.15 MB (d:), empty
ratehd: 26 ms, 408 k/s
quickdex: DMA: 4355 %
Gemdos: 2419 %

The system has TOS1.4 in ROM. With AHDI 3.01, the drive was slower, DMA gave c3800 %, Gemdos c1600 %. My own 296 with Firmware 11 nearly reproduces these numbers. On OS/9 with its 256 Byte sectors the drive doesn't run correctly at interleave 1:1, too. This has been verified on industry systems (Eltec, latest OS/9 version) and not on STs. During the experiments with OS/9 it turned out that the drives were not true SCSI. Completely new driving software had to be developed to make this special HD work at all with the small sectors.

Conclusions:
- Even the 8/12-versions of the st296n cannot be expected running at interleave 1:1.
- In contrast to assumptions issued in earlier postings on this subject, the host adaptor does not affect the transfer rate of the drive. Why should it? Its only task is to convert the ASCI commands to their SCSI equivalents and to pass the data 8 bit parallel with handshaking both toward the HD controller and the computer. And all host adaptors for the ST can be used with much faster harddisks at their full speed. (I know that the SCSI protocol is more complicated than the ASCI protocol. But either it works or it doesn't. Nothing in between.)

So, if You are looking for a cheap and big harddisk and don't mind running it at interleave 1:2, the 296 might be interesting. But the st277n, 65 MB, is cheaper and faster (to my knowledge, the st296n is the only Seagate SCSI drive which has problems at interleave 1:1). So I really would recommend not to consider the st296n anymore unless

You get a VERY excellent price (You should figure out how much the size advantage of the 296 over the 277 compensates for its speed disadvantage in Your opinion.)

Quite recently, Fujitsu has released a series of very interesting SCSI disks. They are nearly as fast as the Quantums and much cheaper. There is a 180 MB version at about the price of the 80 MB Quantum, a c130 MB thing, a drive with about 80 MB priced similar to the st296n, and a small one of some 40 MB. (I am writing from Germany !!!). I don't have the precise specs at hand so I cannot be more precise on that subject. When I have sold my st296 I will probably have a very close look at it in the future. Maybe I have the opportunity to check one of them (the 180 MB) in the next days. Any interest in a further benchmark?

Michael Ritzert
mjr@dmzru71.bitnet

P.S.: I remember a "test" including both the 180 MB Fujitsu drive and the ST296N in one of the last issues of the German ST Magazin. It confirmed the benchmarks above.

3754. Re: Form Doc's

>Hey, it doesn't seem like many folks like the TeX docs to form.

Might be because they didn't have any idea what to do with the .DVI file.
Of course, if you're receiving comp.sys.atari.st, then it's fairly likely
that you have access to a .DVI driver AND a laser printer, like I did.

The docs are quite beautiful when printed on a laser printer. So, at
least ONE person liked the documentation.

>Must be some form of Elitest mentatlity to post docs to a program
>in a format that 99% of the people don't use.

Must be some form of Elitist mentality to DEMAND documentation to a program
be put up in a manner convenient to _them_. The program didn't _HAVE_ to
be posted in the first place. Would you have been happier if that was
the case? If not, I'd suggest you take your 'Elitist' mentality and go
somewhere else.

>Hey, if you are good enough you will have TeX, right? :-)

For the information of All Concerned. You do not need the entire TeX
release to process a .DVI file. You need a .DVI driver (at our humble
little site I have access to a DVItoPostScript and a DVItoLN03 driver),
the requisite fonts and a printer. Heck, you could even use the
DVItoEpson driver that's available via ftp.

Most everyone who has access to network news has access to TeX, if they
really wanted to take the time to find out...

I agree with the netter who wondered whether or not dear old Rich actually understands Laser printing speed. Hey Rich, for your benefit I'll rephrase an earlier posting.

1. I digitized a photo of my daughter with the Migraph Hand Scanner.

2. I printed the .IMG file from a Mega 2 to an SLM804 and it took less than 1.5 minutes.

3. I printed the same file from an AT at 10 MHz with an 80287 also at 10 MHz (overall NORTON SI = 12.4). and the pic took just over 44 minutes printing from GEM Paint. <<< Yeah, 44 MINUTES >>>

The difference is due to transmission speed.

Hey, if you really believe in this 11 ppm, 8 ppm, 6 ppm stuff, that lakefront property in Canada's Arctic is still for sale and has your name written all over it!

I have Atari's VT100 emulator and it works pretty much like a true VT100 terminal (and I have seen a *real* VT100 terminal), even down to the set-up screens, with the only major flaws being that the warning bell (^G passthru) is only allowed if the margin bell (a bell EVERY time a line gets close to the right edge of the screen) is selected. Also, any term program should offer the option of exchanging the functions of the delete and backspace keys to be consistent with Atari-specific applications (after being online for a while, using an ST word processor is hell!).

Ken,
Not to dispute your argument about the reason most people buy their
Atari ST's (to use pre-written code), but I bought my ST in my senior
year of high school to learn how to program. I came from a back ground
of an Epson QX-10 using CP/M and I basically had to write any software
that I wanted to use (uncluding a word processor, network printer server,
music composer programs - all in CP/M using a variety of high level languages:
C and Pascal).

When I first got my Atari, I was greatly disappointed at the availability
of software (mainly due to my location) also in the general desgin of the
ST (I have a 1040ST and the keys are a little akward and the 9 pin ports
are in a stange spot.)

My point is, for home users like me (maybe 10%) the thrill in having the
computer is programming to solve problems, and have a lot of fun in doing
it. And, in my programming of this machine that I have low expectations
of, I have really learned to like it allot. In fact, since I had low
expecatations, the ST has done nothing but impress my since I bought it.
Maybe this is just my view point, but I bet there are allot of other
people out their that also have allot of fun just programming their ST to
solve problems or solve mathematical puzzles, and sometimes that means
knowing how to interface with the operating system.

Maybe Atari could offer a smaller public version of operating system
technical references for people like me. (This is not a complaint, I
like my ST and Atari.) Sorry for making this sooooo long.

3762. Re: Form Doc's

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 05:11:21 UTC
From: saj@chinet.chi.il.us
Message-ID: <1989Dec6.051121.21994@chinet.chi.il.us>
Source record: 246235

I can whine with the best of them (and do, often enough). The point that .dvi isn't the most accessible form seems made. For those who can do nothing else, i suggest using either a strings program or a dump utility on the dvi: enough of the text is recoverable to let you know what the program is about.

Ignac A. Kolenko asks if there are prototyping boards available for the ST's cartridge port. In the June 1987 issue of Byte, there was an article by Tim G. Hunkler on building an interface board for the cartridge port. In it, he used a used a board from Douglas Electronics.

Proto board Part number 33-DE40

Douglas Electronics
718 Marina Blvd.
San Leandro, CA 94577
(415)483-8770

Hopefully this place is still around. Let me know how it works out.

>you can have char *fred[] = "hello";
>or
>char fred[] = {'h','e','l','l','o','\0'};
>but not
>char fred[] = "hello";

Actually, K&R were not misquoted. They say on page 84 of "The C Prorogramming Language" (c)1978,

"Character arrays are a special case of initialization, a string may be used instead of the braces and commas notation:
char pattern[] = "the";
This is a shorthand for the longer but equivalent
char pattern[] = {'t', 'h', 'e', '\0'};
... "

Evidently, the compilers are the ones who don't like it.

Did you say you were from Bell Labs, where K&R came from ...

I just tried the following code on my laser C compiler.
char pattern[] = "fred";

As a global declaration it worked fine.
As a local declaration (in main) it wouldn't compile unless I put the word "static" in front of it. Then it worked fine.
When declared as a static, of course it worked correctly as a global or a local. Apparently that is the way to do it as was said in a previous message.

Case Closed.

>is absolute CRAP. I know of about 20 ST2's that have been expanded to 4 Meg

Yes indeed.. .that _used_ to be true... you could unsolder several hundred
tiny holes and install sockets for RAM to take an ST2 up to 4 Megs..

But... you apparently haven't seen a recent ST2 motherboard...

Atari Corp has redesigned the ST2 motherboard _without_ the RAM locations
for the second bank of chips, making it impossible to upgrade the memory.

You tell me... why would they spend the money on a redesign and retooling
of the motherboard, not to mention the added expense of having to maintain
2 separate inventories of PC boards where they used to be able to use the
same one in both Mega ST models..?

Your statement about having seen ST2s upgraded to 4 Megs gives us a clue..
Atari Corp didn't get a cent from those upgrades...

The "official" Atari upgrade policy is: Get rid of your Mega ST2 and buy
an ST4 from us.

3771. Who owns the ROM code?

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 12:11:27 UTC
From: RiddCJ@computer-science.birmingham.ac.UK
Message-ID: <8912061211.aa03001@benjamin.Cs.Bham.AC.UK>
Source record: 246244

A slightly off-beat question, but I've been wondering for a while.

Who owns the object and source codes to the parts of the Atari ROMs? ie,
the BIOS, XBIOS, Line A, GEMDOS, VDI, AES? My own thoughts are:
BIOS : Atari written
XBIOS : Atari written and altered as time passed (blitter call)
Line A: Atari written and altered to handle blitters
GEMDOS: DRI written, but Atari altered in TOS 1.4
VDI : DRI written, has Atari ever altered it?
AES : DRI written, Atari HAS altered it with new calls (eg fsel_exinput)

What claims does Digital Research have on the VDI, AES and GEMDOS? From the
Hitchhiker's Guide et al, I thought that DRI wrote GEMDOS, if so how can Atari
alter it?

For a fairly simple enhancement to GEM, how about allowing more windows, like
16, instead of the current meagre 8? This would allow all the DAs a window,
and lots for the App (encouraging the use of modeless dialogues). If I ever
designed something like the AES, I would have written #define NWINDOWS 8 or
some such-like, so would be able to change it later.

Shades of the MS Write discussion earlier this year!

Now that Richard's fixed his signature, we have a better chance of mailing him directly, but I thought the following might be of more general interest.

How well the Laserbrain emulates an Epson depends on several things, including how good the printer driver of your applications program is, and what fonts you have installed.

On the first point, where I work we nearly despaired when we got the Laserbrain and tried printing the test document from First Word Plus (UK v3.14). Hardly any of the style features worked, and after printing the character table the rest of the document was printed in the tiny 'York 16' default font. We later found out that the supplied PRINTER.CFG file was for the wrong version of First Word Plus. (I suspect Atari UK had simply redistributed an out-of-date German version, but everyone knows how bad they are, so I'll stop flaming them.) After we took the PRINTER.HEX file and reinstalled the .CFG file, all was well. Similarly, with WordPerfect ST: when we tried it with Laserbrain and the WP Epson FX80 driver, we got rubbish, and only with the latest (Aug 89) version of WordPerfect, which comes with a dedicated Laserbrain driver, have we had success.

On the second point, the number of 'style features' you get depends on the set of fonts you have installed. With the supplied ELITE.DRF (DRF=Druckerfont?? German again??) file, you can get bold, and italics, but not bold italics, and there's no condensed font. It's not too difficult to add fonts to the file, but they all take up space. ELITE.DRF is 350k, and you could easily double that size if you wanted a full set. You might need a 500k file to cover 99% of your needs.

Apart from that, it works pretty well. Except that it occasionally locks up, or starts printing the same few lines all down a page, or throws a page in unexpected places. I'm not an expert, so I don't know if this is a Laserbrain fault or a TOS fault or something to do with the timing of the Atari's DMA channel (I suspect the latter, but I'm not sure.) It is, however, for all its faults a great improvement on the Diablo emulator. To begin with, it actually comes with some documentation!

I hope this is some help to Laserbrain users. I'd like to see the PD libraries carry some disks with better-thought-out font sets.

Graham

3775. How to get ZOO: here's the answer

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 14:58:00 UTC
From: werner@vax1.informatik.fh-regensburg.dbp.DE
Message-ID: <46
Source record: 246248

Dear ZOOlogists.

Here's the answer to the "Who's got ZOO"-mystery. Thanks to all of you sending me all the hints (sorry, too much people to mention them all).

ZOO is available at the

info-server@unido.uucp

and can be retreived by sending a letter with the following message body:

```
request: binaries/atari
topic: volume6/zoo201g/part01
topic: volume6/zoo201g/part02
topic: volume6/zoo201g/part03
request end
```

If you're not familiar with the command of this server, just send an empty message to the address mentioned above.

ZOO might also be available at other servers; I just tried out the UNIDO service.

Thanks a lot for all your answers, good luck with ZOO.

[Ralf Werner - werner%vax1.informatik.fh-regensburg.dbp.de@relay.cs.net]

>This concerns me. To whom did you send the offer? Where did you send
>your letter? Did you send an example program along with your offer?

that's interesting hearing this from daniel. i've had the same thing \
happen here in good old canada. almost 2 1/2 months ago, i got a call
here at work from atari canada (i think the guy i talked to was named
rotenburg, or something like that) about doing some graphics/sound
demos for the STE. at the time i said, "sure, why not". he then said
that it would be a couple of days before he could clear with his
superiors this idea so that he could ship an STE unit to me at
electrohome.

well, its been 2 1/2 months and i have yet to see hide nor hair of the
STE, or any call of explanation from atari canada. its too bad because
at the time of their initial offer, i had the spare time to actually try
to do some useful stuff on the STE. now i don't.

oh well ... life goes on.

Geez, Greg do you have a problem with me, personally, or what? I wasn't really complaining, at least not as vocally as others. But you flame me and no one else.

What gives with you??

As far as Saying Thanks to a poster, just how often do you think that that happens?? Not often from what I see on this newsgroup. So, I don't think that you will see many thanks for a post that for most folks here in the USA could have been written in German or Latin for as much good as it does us.

Agreed it may have fancy math symbols, but still the ASCII TeX file could have been posted instead of the binary .dvi file. Then at least we, those w/o TeX, could have looked at some of the material.

So quite flaming me, huh buddy?

Well, I called the City of Phoenix and asked about meeting places. I was told to contact various Library Branches as they have conference rooms for rent. There are about 4 Phoenix Branch Libraries that are within the area that we want to hold our ST Club Meetings. All four will rent us a room large enough to hold 60 people for $5.00 for an entire morning or afternoon.

I am going to present the idea of holding meetings in our next meeting, and try to get a vote on it in the Jan meeting.

Looks good.

3781. Spectrum 512 palettes

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 15:58:39 UTC
From: fuhrhop@fokus.berlin.gmd.dbp.DE
Message-ID: <1097
Source record: 246054

I'm trying to convert some pictures to Spectrum 512 format.
I'm using the information from the "ST Picture Formats" list from
Dave Baggett:
Spectrum 512 (uncompressed)
80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)
51104 bytes total

Unfortunatly the pictures I get into SpecTrum 512 have got the wrong
colors. Could anyone enlighten me why there are three palettes for each
line and how they are used by Spectrum?
Are the colors in all lines in Spectrum independent?
Are there 16 different colors per line? 14? 48?

Confused

3784. User Group Meeting Places

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 16:35:15 UTC
From: steveg@SAIC.COM
Message-ID: <8912061635.AA00899@NARNIA.SAIC.COM>
Source record: 246057

(Richard Covert asked about user group meeting places).

Our local chapter of the NOVATARI user's group meets in a public
library. Have you tried that route?

On another note, I'd like to compliment you on the more constructive
comments in your recent posts. Keep at it, you and BobR are getting
better. BTW - the TT/p does NOT need to be expandable - I see it
being offered as an unexpandable but cheaper alternative to the TT/x.
But of course neither is yet available, so we'll have to wait (and
wait and wait :-)) and see.

Stephen Goldstein steveg@saic.com

TOS.

I just received a catalog from some place in California which sold PD and
commercial software. On one of their PD disks was a patch for STOS running
on TOS 1.4. If you are interested, mail me and I'll e-mail the address
and info back.

Enjoy.

In his 01 Dec 89 04:38 PST Ralf Werner writes:

>No disclaimer or cookie (they're often bigger than the message itself)<

And he's right (I'm not sure what a cookie means in this context, though).

I say this in the nicest way possible - could certain people please reconsider the relevance of their signature lines? Is it really necessary to post a Smart Ass One Liner followed by about 1K of signature, disclaimers, little drawings in ASCII, quotations from the unspeakable Douglas Adams (spit), and readings from the Articles of War?

Ploughing through it all - particularly the same one several times in one INFO-ATARI16 Digest - can become a distinct pain in the exhaust port, besides the waste of bandwidth; in some cases the actual message (all hundred or so characters of it) is very hard to spot in amongst the embroidery, chromework and go-faster stripes.

Younger Members will probably consider me somewhat old-fashioned in that I still (even after ten years of Thatcher) consider content to be more important than presentation. They are right. I am. It is.

Thank you all.

>I have a few questions about Xformer:
>
> 1. What is the current version
> 2. What systems does it support now (ie.8bit,c64 appleII)
> 3. Just how fast is it now?
> 4. How easy is it to get the .SD files over now?
> 5. Where do I get a copy of the latest version?

Troy (or whatever),

1. The current version of ST Xformer II is 2.55. Version 2.6 will be released as soon as the Atari STE is released, so that I can add 16 grey level support and take advantage of the better sound and scrolling, but who knows when that will be. Sam Tramiel promised that the STE would ship in October, so I guess his word isn't worth spit.

2. 130XE only. Apple II and C-64 emulation were dropped so that I don't get sued by Apple and Commiedore.

3. 50% the speed of a 130XE, the best that can be done with a software only 6502 interpreter. If you have Jim Allen's T16 board (the only accelerator board worth anything) it will run at up to 80% the speed of a 130XE.

4. Very easy. You don't even have to use .SD files. Just copy files directly from the 8-bit disk to the ST disk using DOS 2.5's Copy command.

5. The software is public domain, so you can download it from places like Compuserve or GEnie. Or you can get the disk and manual from me for $20. Or you can buy it from some Atari dealers, but be warned that all they do is download the stuff from Compuserve or GEnie and sell it to you at outrageous prices. I have nothing to do with that.

Also be warned that I have nothing to do with the manufacture or sale of Xformer Cables. I placed the plans for those cables into the public domain a year ago, and now some dealers are making their own cables and selling them. I personally have come across a lot of bad cables. Pins are shorted together and other goodies. So don't complain to me if you fry your ST.

With the Xformer Cable, you can run such disks as Atariwriter Plus, B/Graph, Action and BASIC XL runtime packages, MAC/65, SpartaDOS, and even Choplifter and Lode Runner, although a bit slowly.

>Apple clones (other than STs :-) exist yet.
>
>It is a technical difficulty, or a legal one?

Primarily the former, secondarily the latter. To "do it right"; i.e.: to avoid committing legal hari-kari, companies use what I've heard called a "clean room" approach. Two design teams work on the problem. Team #1 looks at the *specifications* for what they're trying to clone. It's probably fair for this team to look at ROM images, but I'm sure it'd be better if they didn't. Team #1 generates their own specs for how to functionally reproduce what is to be cloned. Team #2 only sees this spec, and can never look at the original materials team #1 used. No fair going to team #1 and saying, "Hey, we're having a hard time seeing how to do 'bletch'; how did They do it?" If the original specs were accurate, and team #1 did a good job, and team #2 did a good job, the clone works well.

And even after all that, if the opposition is sufficiently larger than yourself, they may be able bleed you dry in court. You may be perfectly legal in what you've done, but proving it takes time and $$$.

> How does Phoenix et al. get
>away with IBM clone ROMs? Licensing? Work-alike?

What's in IBM ROM BIOS is surely an order of magnitude (or more) easier to reverse-engineer than what's in Mac ROMs. Not to mention that it's (at least originally, and perhaps still) far more lucrative if you succeed with IBM BIOS.

Don't hold your breath for Mac OS clones. Apple has shown itself to be quite willing to vigorously defend what it considers its turf, whether "common sense" says they have a case or not. The cost of developing a Mac clone "done right", plus the possibility of locking horns with Apple in court afterwards, is enough to scare away most of the cloners. I'd expect to see Apple license their ROMs before we see clones, and they haven't been too receptive to that idea either.

3791. Re: C question

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 17:45:24 UTC
From: ron@argus.UUCP
Message-ID: <1381@argus.UUCP>
Source record: 246064

Someone asked why
```
main()
{
char fred[] = "hello";
....
```
won't work, and a bunch of answers followed. Some made no sense, others were close, but I haven't seen the complete answere yet. So here it is:

The error from the compiler on this line is probably something like:
"No initialization of automatic agragate."

This means that an aggragate structure (an arry, struct or union) that is automatically allocat cannot be pre-initialized. Automatics are any variables declared INSIDE of a function (this excludes the functions arguments). For non-aggragate variables, (int, *, cha the compiler will generate storage and code to initialize. It does not do so for aggragates.

The solution is to make the variable non-automatic. Someone mentioned declaring the array as
```
static char fred[]
```
which will work just fine. Global variables are also not automatic, so moving the declaration outside of main() will also work.

C provides the keyword "auto" to make variables automatic. I've never seen it used, since it is only valid within functi (or block) scope and it is the default.

The "static" keyword has an interesting side effect: a global symbol declared as static only has file scope. This allows you to create global vaiables and functions which are visible only within a file:

```
static int foo;
int bar;

static int bas()
{
...
}

int baf()
{
...
}
```

baf() and bar may be declareas extern in other files and used normally. However, foo and bas() CANNOT be referenced outside of the file! This is

sometimes useful if you want to be sure that certain variables or functions
cannot be accessed from other code.

From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8912061931.AA15416@ucbvax.Berkeley.EDU>
Source record: 246066

Hello all,

I can't believe the clamor that's been going on here about the form docs.
Here is a nice person who sends around a sophisticated scientific application
package IN THE PUBLIC DOMAIN. He then proceeds to include a professionally
typeset documentation in freely reproducable form (ie. you can print as many
copies as you want).

He then gets flamed for (1) using TeX, (2) not using "inclusive language",
and (3) using a paper size that's standardized in Europe and a few dozen other
countries, but not in the Good Ole Redneck USA.

Did anyone say, "Thanks for sending this around, but I can't make use of the
docs, so please help me, I have this-and-that printer"? No! I'm not flaming
any individual here, although I'm itching to do so. (Right, Richard?)

I'm sure if someone politely asked Jos, he'd be able to put together a list
of needed fonts together with instructions on how to get printer drivers for
.DVI files. I advise him to ignore all other postings.

There, I feel better already. ;-)

Maybe now I can find some time to look at the program. Many thanks to
Jos Vermaseren to share his work with us.

| How does one use it?
|
| Thanks in advance,
| C. Breyman
|----------
```

Change the name of the program to represent the number of extra folders you want - e.g FOLDR100.PRG gives you 100 extra folders. Now put this into your AUTO folder and boot. As I recall, FOLDERXXX.PRG should be the first AUTP program run, but should follow FATSPEED if you use that.

How many extra folders? The rule of thumb I've heard is to set it equal to the number of folders on you disc drive. I think this is for the absolute worst case of accessing all the folders at once which may never happen (a disk catalog or search program probably will do this).

3796. Seagate 296N, 277N

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 19:49:45 UTC
From: steveg@SAIC.COM
Message-ID: <8912061949.AA01045@NARNIA.SAIC.COM>
Source record: 246068

For those interested, I picked up a Seagate 277N (65Meg) drive at the D.C. AtariFest, and got similar performace figures to those posted for the 296N - ~55KB/sec for 1:1, and ~330KB/sec for 1:2. I was in desperate need of the extra space, so I wasn't too disappointed with having to go 1:2, and I really haven't noticed that much of a difference - should only show up on massive file moves. Then again, seeing 500+KB/sec on my other drive (the 30Meg mech. from my Supra 30) is enough to make me curious about tweaking 1:1 out of the 277N. I'm using a Supra host adaptor (from the old drive), Supra software, and Toad Computers' 1/2 height under the Mega style HD case -- a little pricey ($119), but I needed its form factor.

3797. Question: Saving the Menu Bar

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 20:01:04 UTC
From: gl8f@bessel.acc.Virginia.EDU
Message-ID: <2407@hudson.acc.virginia.edu>
Source record: 246069

In TeXShell, which shamelessly borrows code from Moshe Braner's generic DA code, I save the menu bar by knowing that it's the first 380 longwords after the start of the screen, which it gets from Physbase().

Now, obviously, this is a dumb thing to do in the days of bigger screens. So what's the best way to save the menu bar? I could try getting the height of the font, and assume the menu bar is smaller than 2 character heights, and then blit it into a buffer. Or I could try doing something strange with window creation to see how close to the top of the screen I can put a window.

What's the best, most portable way?

Thanks in advance.

Greg Lindahl

> solution.

By some coincidence, this came up in a conversation recently. It was decided
we need a new, genderless pronoun. My suggestion: "e." Yup, just "e."

It's close to both "he" and "she," and dovetails nicely with "I."

+ >
+ >
+ > This has been confusing me for a while, as K&R (surely correct!) would
+ > seem to indicate that this is indeed permissible!
+
+ NO NO NO
+
+ you can have char *fred[] = "hello";
+ or
+ char fred[] = {'h','e','l','l','o','\0'};
+
+ but not
+ char fred[] = "hello";

yes you can.
it sets up an array of chars including a null.
fred then refers to the address of the first byte in the array
and fred[n] is one char.

you usually can't do this, tho, inside a function unless you
declare it static. Also, it's gotta be before any program instructions
on most compilers.

3801. Spectre & Adobe Type Manager

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 20:17:19 UTC
From: mjv@iris.brown.edu
Message-ID: <22321@brunix.UUCP>
Source record: 246073

We just received Adobe Type Manager and of course I quickly installed it on my Spectre GCR system to see if it worked. First, a little background.

Adobe Type Manager replaces the way the Mac displays fonts on screen. Noramlly, the Mac uses bitmaps that are installed into the system. To get a nice looking font on the screen, you need to have that particular size installed for it to look nice. If you don't, then the Mac's QuickDraw routines will try to scale it and most often, it looks very, very ugly. ATM catches all those font scallings and uses its own outline fonts to create nice, clean fonts in any size. This is very important for both the screen and ImageWriter (or other dot matrix and QuickDraw printers) in that all the fonts will scale smoothly.

My system is a Mega2 with a ICD host adapter and Seagate 277R 65 meg HD and the Spectre GCR. The ATM disk contains the ATM INIT (an auto file) and a control panel document (Cdev). There are two inits, one for the 68000 Macs and one for the 020/030 Macs; we, of course, use the 68000 one. The disk also contains the outline font files for 4 fonts and their bitmap fonts. For the ATM to work, you also need at least one bitmap size font installed, the more the better(10 and 12 is a good minimum). You can turn ATM on or off from the control panel and boot up in case an application will not work with it.

Here are some interesting figures I found after using ATM for a bit. Installing ATM and all the outline fonts files for the all the fonts in a LaserWriter + (Avante Garde, Bookman, Courier, Helvetica, Narrow Hel., New Century Schoolbook, Palatino, Symbol, Times, Zapf Chancery, Zapf Dingbats), took up about 1,350K on my HD. Note: I already had the bitmaps for the fonts installed before ATM, your mileage will vary.) The amount of memory that I had decreased by 200K. 100K is needed for ATM and a minimum of 64K in needed for a font cache (you can set this). The font cache holds the data for some of the scalled fonts that you have done. If you use a font that has been previously scalled and is in the cache, it appears instantaneous. The large the cache, the faster the scales are. The scales themselves are very fast if you consider what it is doing. Generating a 33 or 57 point size for example, took only a few seconds with wonderful results. The larger the point size, the longer it will take.

I tested ATM with Word 4, MacWrite 4.6, MacDraw II 1.0, MacDraw 1.9.5, both SuperPaint versions, and WriteNow 1.0. All worked.

ATM is a serious memory hog. 1meg users might want find that some of their programs no longer run in so little room (about 600K). I don't know if disabling ATM will help. However, it might be just your cup of tea since it will do very nice results on QuickDraw printers such as dot matrix printers, QuickDraw laser printers and the QD DeskJet.

BTW I didn't have time to check it out with my printer (Star NX-10) and Epstart 2.5 (Epson printer driver) but I will report on that in a bit.

Hope you find this useful.

3802. Will there be a Jan 1990 ANALOG Magazine?

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 20:35:05 UTC
From: covertr@force.UUCP
Message-ID: <474501d8.14a1f@force.UUCP>
Source record: 246075

I just got my December 1989 issue of ANALOG Magazine. I have a subscription good thru July 1990 of ST LOG which was transferred to ANALOG with the November 1989 issue. The October 1989 issue of ST LOG was the final issue. Does anyone know, has any been contacted, if ANALOG will be published next year?

The final issue of ST LOG was very clear that it was merging into ANALOG, so the publishers knew well in advance. When other ST magazines have stopped publication (died :-( ) the last issue clearly said that it was the last issue. But, there is nothing in the Dec 1989 issue of ANALOG to indicate that is the final issue. In fact, there are 2 subscription forms in it for NEW subscribers??

I wonder if I will get a free subscription to Hustler (same publisher :-))?

Anyway, while I hate to see an Atari magazine fold, I just plain don't like the December issue. It has a bunch of pages about new electronic gadgets for Christmas. While this article is nice, it is just filler in an Atari magazine. This article should have been in PopularScience or Consumers Reports or something like that. I didn't buy an Atari magazine to read about a new Sony WATCHMAN color tv!

Also, I don't care for the way 8bit and ST articles are mixed together. I would prefer that the 8bit be in a ripoff insert in the middle of the mag. Than I could discard the 8bit section and keep the ST mag intact.

I will miss Clayton Walthum's CManShip column. I hope that he is picked up by STart, but I doubt it. I will miss Ian's Quest and a few other columns. All in all, I preferred ST LOG to STart and that's why I subscribed (sigh) to ST LOG instead of STart.

If ANALOG indeed is dead, it is a sad day for us all!!

I just downloaded the copy of GNU C from terminator, oh, two weeks
>ago, the same time I downloaded the pml package. Maybe I should try
>drgsun.

Bammi recently put GCC 1.36 on his server -- say "gcc -v" to find out
what version you're using.

>At any rate Megamax C blew GNU C away in speed and executable size
>(GNU C took twice as long, and the executables were around twice as
>large). The only problem with it is that it doesn't have stdlib
>functions, although without those I can still improvise.

When you say "executable size" do you mean the size of the PRG file?
That's not a good indication. There can be any amount of information
in the PRG file besides the program: symbol tables, debugging
information, etc. If you use -g on the GCC command line, that's your
answer: it generates LOTS of info for the symbolic debugger GDB (and
UN*X's dbx).

The right way to find out executable size is to dump the program's header
and look at the size fields. The dump will look like this:

60 1a tt tt tt tt dd dd dd dd bb bb bb bb ...

601a is a magic number. tttttttt is the text (program) size in bytes.
dddddddd is the data segment size in bytes. bbbbbbbb is BSS. Compare
the SUM of text + data, because GCC might be putting strings in the
text segment, while Megamax might put them in the data segment. Also
make sure they're both talking about the same things: use -mshort for
your comparison (even if the program doesn't work that way) if Megamax
has 16-bit INTs.

Of course, MegaMax C has *8* bit shorts, and some required keyword
concerning modules or overlays or something, so I have no respect for
it at all...

bds@lzaz.ATT.COM (Buce Szablak) writes:

| > It is important to make sure that professional programmers know how to
| > program the computers, not end users.

| Sorry, you are way off base here. Most PD software comes from end-users
[...]

I'm not way off base. I may be wrong in your case, and in fact I may be wrong in the case of every person who reads comp.sys.atari.st! But active members of online communities aren not by any means representative samples of ST owners. If the online community were more ubiquitous, I would grant that your experiences were representative, but it isn't, so I can't. My opinion is based on my experience working in a computer store, working with user groups, supporting development tools, and talking with Atari's user group and developer support people. Users, by and large, want to use their computers.

As far as supporting hobbyist programmers, I take a pragmatic stance. How much PD software comes from where is not directly important to a computer maker. It is certainly indirectly important, because a wide variety of PD tools make a computer a lot more attractive to the informed buyer. But a wide variety of professional products make a computer more attractive to the market at large. A lot of people buy the computer that runs the software that they want to run. That is why it is vital for computer makers to have a broad commercial software base for their machines. In order for that to happen, strong support for the companies that produce that software must exist.

A side effect of having strong support for professional programmers is that end users get supported as well. More books get written by the professionals, making more information available to the hobbyist than the computer maker can hope to provide. A broader base of technically competent people exist to answer the questions of hobbyist programmers. All these programmers will be happy because they can get their questions answered and they can solve their problems without having to stumble around in the dark too much.

| BESIDES, aren't I (an end-user who uses
| his ST to write programs for enjoyment) a valued customer????
| Aren't my CUSTOMER needs important??? Your attitude really bothers me.

Every customer is a valued customer. You are an espeically valued customer, because you take the time to give feedback on how you think Atari is doing. I'm sorry that my attitude bothers you, but I think that it's a practical one. I hope that I've clarified where I'm coming

from.

Please note: the opinions expressed in this article are mine and mine alone. Atari has its own.

One thing a lot of people don't realize is that the amount of necessary code
in the roms is quite small. Thats because the system file contains patches
to the different revisions of mac roms that overlay buggy or outdated code.
So - all the roms have to contain is stuff found in the basic 64k roms.

OK ! I have just compiled dvitty and filtered the infamous
form.dvi into good 'ol form.asc i.e. plain ascii file. You may
have to fiddle with end of line (unix vs tos \r\n vs \n stuff)
but its done.

(well sort of done -- the dvitty driver crashed while doing the
index - jeez how many contributors give ya such a nice manual
with an index even! The last I can remember was UNITERM)

The arc'd (that ok?) file is 163K so if some ONE will give me an
I net address for anon ftp I'll put it out there where it can be
accessed.

dvitty is a mixed C and Pascal source code. I compiled it on a
Sun. It crashed while doing the index to form.dvi. See my
earlier post for availability of the form ascii file.

3809. Starting a New ST Magazine in the USA

Newsgroup: comp.sys.atari.st
Date: 1989-12-06 22:59:01 UTC
From: covertr@force.UUCP
Message-ID: <4745828e.14a1f@force.UUCP>
Source record: 246082

for the United States? I know that ST APPLICATIONS started
out as a small Mom and Pop limited circulation newsletter
type magazine. ST APPS grew into a very respectable full
glossy page magazine.

It seems with the availability of online services, such as
GEnie and CI$, and the DTP in the ST (PageStream, Calamus),
and the SLM804, that someone could put together a respectable
little magazine on a shoestring budget.

For example, the Phoenix Atari ST Club publishes a bimonthly
newsletter called PHAST which is developed entirely on a
Mega ST4/SLM804 system using PageStream. We do a camera ready
copy and send it out to be printed, collated, and stapled. We
then put on the mailing address labels (also done on a Mega ST4).

It would be great if the best authors of ST APPLICATIONS and
ST LOG could get together to work on the new ST magazine.

Any ideas outhere??

I mean even Current Notes, which is a nice magazine, started out
as a DC club newsletter.

Just a thought.

The PHAST newsletter is published entirely with PageStream.
Are there any other ST Clubs out there that would like to
share ideas about PgS and newsletters?? I would like to
see ideas about how PgS more effectively. Or what kind of
clip art you use. Or how you use PgS in making your newsletter.

I have not worked with PgS myself. A couple other PHAST clubmembers
do most of the work. BUt I would like to help them so any
info would be appreciated. Our newsletter is printed out
so that it is folded in half and then stapled (using standard
8.5" x 11" paper). The guys doing the work seem to like PgS
version 1.8 alot.

> desire to program their machines. The simple fact is, most people who

You might be right there - but what about the so well-known PD/SW programs?
There are a lot of goodies among these, like the Quick ST etc.
The programmers who make these programs are considered "end users", or..?

> buy computers want to _use_ their computers. They don't want to be

Yes. Of course. But _MANY_ of those have bought a computer to be able
to program it as well as use it! Otherwise they would have bought a video
game. The percentage who bought it as a business computer? Well, I guess
you can count it out. You haven't got a great reputation, you know.
The STE isn't going to do it any good either, nor the LYNX.

> | [...] it must be possible to post a minimum of information to some
> | knowledgeable people in the right places.
>
> Who is "knowledgeable"? What is "the right place"? How much
> information is "a minimum"?

"Knowledgeable" is for example the people who wrote Quick ST. And there
are more people on the net (for example). And the journalists of a
computer magazine such as the swedish one, "AtariSTen". And that is the
right place, too. It's not YOUR business -- but it is Atari Scandinavia's.

"A minimum" of information is, in this case, a list of adresses to the
new chips/enhanced chips and a _short_ explanation of what to put there.

I know you did this with early STs: They got some kind of addendum with
a list of adresses to the PSG (complete with waweform diagrams!) and
such. That's the kind of information I want. Not internal TOS behaviour.
But the most important stuff, of course stripped compared to the dev. docs.
That doesn't matter.

Like now, how easier everything would have been for me if the
source-code (in Turbo-C, I know.) to the demonstration programns would have
been there, right on the language disk. I do think you had some spare
space, huh? Not of interest to all, no. But of great importance to others.

> And what do you call the information we have been posting?
> Chopped liver?

No, I don't. And I think I mentioned the fact that I thought this
was the way to handle things. (Like the ARGV defs -- wonderful!)
I refer to my earlier postings.

> | And there're a lot of developers on the net, too.
>
> In fact, only a tiny percentage of commercial ST developers are active
> on the net.

But it just MIGHT be "cost effective" to post it to the net, then?
Fine.

> | And people from the net DO forward things to the right places.
>
> It's true that net.info gets spread around quite a bit. It's also
> true that it gets warped on the way out. People are misquoted. The
> information may be wrongly interpreted at the far end, with no chance
> of the person(s) responsible for the original post to clear up the
> mistakes.

Mostly it's correct. KERMIT don't missquote things, I think. Nor do
ZMODEM.
Maybe XMODEM does, I don't know :-)

This is no reason. If you post something of any importance (like a
program or the ARGV stuff) it's not rewritten -- it's just sent
further by file transmission.
No missquoting there...

> [interesting chain letter analogy deleted]

Oh... :-)

>
> | It should at least be "cost effective" to give this information to
> | developers without them having to ask!
>
> Registered developers get a lot of information without having to ask
> anything more than "Where's my developer kit?"

This was your words. "Just them having to ask", or something like that.
Look in you article.

Reading all the messages from developers (the LOW percentage, remember?)
who aren't satisfied with the information, I can't agree with you.
But I don't really have inside information. We better leave the subject.

> | Why should I buy a computer I can't use? Like buying a car and when
> | you ask for an explanation of the buttons getting the answer: "Sorry,
> | you have to be a registred driver to get to know this. You shouldn't
> | know about more than the gear and the wheel."
>

> Why do so many people use this analogy?

Maybe because it's a good one?

> A computer is not a car. A computer is a computer.

True, but you want to use your computer, just as you want to use your car.
And you want to program it, to drive it. At least some of us. :-)

> But, since you insist, getting technical
> information (on a level equivalent to "How do I program DMA sound?")
> from an auto manufacturer isn't all that easy either. Try it some time.

Maybe not, but I do think the auto man. would answer the question:
"Where are the ---SOMETHING---"? ("At what adress is ---?")
And the car company cooperates with people writing books about "do it yourself".

But since you're not comfortable with this analogy, we'll leave that too.

> | Have nobody thought of the possibility that there might be something
> | wrong? Why should we otherwise be bashing Atari?

> their input on how Atari should run its operation will be listened to.

Oh? Since when have you been answering tech. questions from net people?
(Low end users?) Not in this case, at least. (But again, I KNOW, I KNOW,
you have done that sometimes - that's why I got surprised of these
negative answers to my humble questions!)

> | I have offered to help writing some demonstration programs to be put

> | obviosly not interested.>
> This concerns me. To whom did you send the offer? Where did you send
> your letter? Did you send an example program along with your offer?

I sent it by electronic mail to kbad@atari.UUCP, that is YOU. (Message
dated Fri Nov 24 12:26:13 1989, subject: Questions about the STE)

And NO, I did not send an example program -- I had still got no
information about how to program the STE, remember?
Since my english is a bit strange and foreign, after all -- you might
not have understood me. But now you have, and the offer is still there.

If I write something that is better than the existing programs, is it
possible to get it distributed on the language disks?
Is it possible to write some kind of "dealer demo" that could be sent
out to dealers from Atari Corp. with a lot of stunning graphics and
sound, as they say?
I can do a lot of this myself, and I know more people who would be pleased
to help. If it's possible, well my mail adress is below.

>
> | I do not want Atari Corp. to die [...]
>
> Nor do I. I hope you are able to get the information you want to program
> your STE soon. But remember, Atari gives registered developers special
> treatment, and they deserve it, because they write the software that
> sells Atari computers.

I think you're absolutely right in giving the developers HIGHER support
than end users, but I do think you could give us end users a little
more support than you do.
We're not asking for much (are we?).

And, this is of course my opinion, and if it "awakens the beast within you",
it's not my fault. You shouldn't have read this...

in article <8912020815.AB27991@ucbvax.Berkeley.EDU>, AMEIJ@vax.oxford.ac.UK (Jan Ameij) says:

> Anyone notice the collossal damage done to IBM by the availability of MS-DOS?

It really works both ways. That MS-DOS was available to anyone, and IBM PCs were real easy to clone, the IBM PC underwent a magic transformation that changed "proprietary" to "industry standard". So, at least for awhile, IBM could pawn off any pile of dross as the latest technology, and get away with it. Then they started to lose market share to the cloners, and had to start getting real. This started happening shortly after they introduced the PC-AT. And it's still going on. Sure, IBM managed to assure that the PC would be necessary and not obselete for some time to come, despite how bad it was all done. However, they also managed to lose control. IBM is no longer necessary for the success of the PC, they continue to lose market share, and they're having to sell you something that goes faster for less money than they were. That's good for the consumer, as is most competition, but it's not so great for IBM. It's hard to say what would have happened if IBM were as closed as Apple (software wise of course -- the Mac is even easier to clone in hardware than the PC, as witnessed by things like Spectre or AMAX). Certainly there never would have been a Compaq, Tandy might have continued souping up TRaSh-80s, and there might have been even more proprietary systems. Or maybe all the "other guys" would have settled on something superior to MS-DOS long ago. In any case, the effect on IBM isn't as clear cut as it might seem.

From: hedger@inmet.inmet.com
Message-ID: <30200029@inmet>
Source record: 246087

I'm using Uniterm V2.0e and I have a recurring problem....
I get put into some sort of wierd graphics mode intermittently.
I suspect this is one of the Textronix modes that the programs
supports. I can't really recognize a pattern to it.
I always assumed it was being caused by some garbage being received
at the modem and interpreted as commands, but I don't even know if
this is a feasible cause.
Any one have this problem ? Any comments ?
Do I have something setup wrong ?
If I can get some sort of answer or suggestion about this I would
appreciate it. If I don't get anywhere, I am planning to try to
get a note to Simon Poole via the net so that he will know about this.
thanks,
keith

ERIC HOBBS writes:

" I have heard in circles that the Spectre GCR is faster than a 8MHz Mac Plus. Just how much faster is faster? I you can, maybe you could give me some benchmarks for comparison. Thanxs."

No benchmarks here, but I can tell you that SuperClock is off by about eight minutes after the Spectre has come on-line in a one hour period. By being off, I mean that it is eight minutes too fast. I wish that Dave could fix that, but it does impress MACers who wonder why my clock is always running fast.
Secondly, a good demo which shows how much faster Spectre GCR is than a real Mac is Aldus's FreeHand self-running demo. After one minute, the Spectre is about four pages ahead of a real Mac plus equipped comparably, i.e., memory, hard drive, etc.
Also, putting a Mac Plus and Spectre equipped ST will reveal that the Spectre offers a snappier screen. No doubt about it, the Spectre is just faster.

Hi.
I recently downloaded COUNTRY.ARC. It de-arced just fine, but when I run COUNTRY.PRG, A Dialog box pops up that says: Error #008 PC>$000000.
What Happened? I ran it on a .5 Meg 520 STfm with NO accessories or AUTO progs loaded.

If it turns out that COUNTRY.ARC is messed up, Is there another archive site that has samples and a player?

Thanx.

Eric Hobbs

> command line options.

Well, do You really have a library manager with a script command? Mine doesn't have one. At least it is not documented. There is a serious bug in the compiler (version 2.3):

If You want to use a common block only in some subroutines You have to declare it in Your main program. Otherwise You will get unpredictable results. This is the only Fortran compiler I have used which behaves this way (and I have been writing Fortran programs on many systems).

I am on a VAX-8350 and use kermit-32> also...

I have found that 99.9% of all KERMIT up/downloads will work using UNITERM 2.0d if you issue a "SET DELAY n" command: whereas; n = number of seconds you think you'll need to select the SEND/RECV file and go into send/recv mode...

Hope this helps SOMEONE out there....

1.
When you use PC Ditto (software version) on a 1meg ST, you have 703K of memory in PC mode. What can you do with that extra memory? Can you create a 63K ram disk, leaving you with 640K while giving you some extra speed? Can you create bigger ram disks, which will use the 63K in addition to whatever other part of the 640 you want?....I'm new to the ms-dos world, only getting into it after having gotten PC Ditto (which I really like as a software product!). So, if anyone out there has any suggestions on this topic, I'd appreciate it if you could keep it as simple as possible. Thanks!
2. I know that Avant-Garde has a RT on Genie, but does anyone out there know if they have an address on CIS (since that can be accessed via email without actually being on CIS)?
As usual, thanks in advance for info any of you may have. Email me at the addresses below, or post to the net.

Rich,

Our Pittsburgh, Pennsylvania-based group is able to rent a room
at a Marriot Hotel near Pittsburgh (8 minutes) for only $75.00 for 4 hours!!!

Why not check into renting a conference room at a Holiday-Inn or other reputable
hotel????? I'm sure the cost wouldn't be that bad....

Our group--The Atari Elite ST Organization--has filed for and is classified
and registered in the state of Pennsylvania as a NON-PROFIT-ORGANIZATION.

Membership dues are $25.00/year and include a bi-monthly "newsdisk"(810k)

A $2.00 "donation" is made at the door by each member at each meeting (monthly)
to help defray the cost of the room...with 60-70 people, it's quite easy!!!!

I think the KEY TO AVOIDING HIGH RATES is to file for Non-Prof-Org. status

To my knowledge--many hotels have special rates for NPO's and if you can work
a contract (annual), you SHOULD be able to get a HEALTHY discount!!!

Lemme know after you do some checking!

> large). The only problem with it is that it doesn't have stdlib
> functions, although without those I can still improvise.
GNU C executables are twice as large only for small files (the library is
more complicated, and not as well organized, so it has higher overhead).
For larger files I would expect the GCC to produce smaller code. And yes,
GNU takes longer to compile; Laser is *really* fast. On the other hand,
programs compiled with GNU execute faster, and the GNU optimizer is a *lot*
smarter than Megamax's (GNU knows not only when to put things in registers,
but also how to change multiplications into additions inside of loops,
so that "for (i = 0; i < end; i++) a[i]=foo(i);" produces the same code
as "for (p = a; p < a[end]; ++p) *p++ = foo(p-a);".

One other note: the library as distributed has a serious bug in the compare
routine for floats. That should be fixed soon; a temporary workaround is
to use doubles instead of floats. This may have been causing your problems.

3827. Re: Will there be a Jan 1990 ANALOG Magazine?

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 04:40:46 UTC
From: landry@enginr.dec.com
Message-ID: <6670@shlump.nac.dec.com>
Source record: 246100

I talked to the Analog subscription office. They said that
the December issue was the last and that they would be issuing
refunds. I haven't heard anything official from them yet.

The reason I was talking to them in the first place is that
they sent me the 8-bit disk for Nov and Dec. (My subscription
was transferred from ST LOG as well.) They told me they would
send out the right disks, but I haven't gotten them yet either.

"
" I have two friends who both have SS drives and would like to upgrade to DS
"drives. One has an old SF 314 with a corner button eject and the other
"has a 520STfm.
"
"1. What is a reliable and cheap DS drive to buy as a replacement? Netters
" have mentioned a Toshiba model several times.
"
"2. Are there any hardware changes that need to be made? For example, if
" it can't normally recognize media changes.
"
"3. What is a good price for that drive and suggested place to purchase
" from?

Several sources can be found in the pages of Computer Shopper.
Prices seem to range in the $65 - $75 range for either Teac or
Toshiba and usually include the 5.25 mounting kit which you
won't need. I've listed a few sources below but can't advise
you good or bad on any. I have a drive on order from Gems but
I picked them mostly 'cause they had some other stuff I needed.

Gems Computers 408-988-0161
Falcon Distributing 213-390-3955 (claims to beat any advertised price)
PC Discount Center 312-390-7450
Amax Applied Technology 818-282-9992

Just noticed another one - This is a small classified ad listing
various hard and floppy drives. They list a 720k floppy for $45
or $66 with the mounting kit. No brand or model mentioned.
Digital One 216-951-8088.

Yes, when the Uniterm docs were released as a .dvi file, there were
many screams and yells. I offered to print up and sell copies at cost,
but nobody took me up on it. I must say that the Uniterm manual did
look quite nice.

Fortunately, now anyone with a SLM804 can print the .dvi files easily,
and anyone with a monochrome screen can preview them.

as far as TOS is concerened, it sees no difference between an IBM 3.5 disk and an ST disk, unless the IBM is a 1.44 meg. The 720K ibm disks work fine on the ST.

The IBM operating system has a problem with ST formatted disks for some reason, which I am sure someone else can tell why. If you want to use both formats reguarly, then either format all your disks on an IBM, making sure it is formatting 720K and not 1.4 meg. OR use DC-formatter which will format DOS compatable disks from the ST desktop.

>anyone know, has any been contacted, if ANALOG will be published next year?

I had begun to wonder about this, too. Among my reasons was this: I sold
an article (about Usenet) to ST-Log last summer, and I never saw it
published. To find the answer, I contacted Clayton Walnum directly.
His response was that December's was the final issue of Analog. There
will be no more.

(The Usenet article was scheduled for the Feb. issue of ST-Log.)

>I wonder if I will get a free subscription to Hustler (same publisher :-))?

Definitely different software.

>I will miss Clayton Walthum's CManShip column. I hope that he is picked up
>by STart, but I doubt it.

I haven't heard anything about Clay's plans. I do know that he is still
running the Atari SIGs on Delphi (a commercial on-line service). And even
though ST-Log is dead, the last time I logged onto Delphi's ST SIG I was
greeted by the old ST-Log banner.

3832. Image Systems' ultra-high-res display adaptor

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 05:59:04 UTC
From: steve@thelake.UUCP
Message-ID: <1106892359043679@thelake.UUCP>
Source record: 246005

I saw a demo tonight of a Mega ST card that drives any multisynch monitor capable of 50 Khz horizontal scan. Here is the information from a product data sheet:

Image Systems Ultra-High-res Display Adaptor
1024 x 768 non-interlaced, 16 colors from a palette of 4096
1024 x 768 "Duocromatic" mode -- monochrome monitor or two colors on a color monitor.
Optional 68881 math coprocessor
BLiTTER supported
Introductory dealer price $500

Image Systems Corporation
11543 K-Tel Drive
Hopkins, MN 55343
voice (612) 935-1171
FAX (612) 935-1386
WATS 1-800-IMAGES0

The setup was demonstrated on a 16-inch Nanao FlexScan 16-inch color monitor. It happened to be sitting next to a Mega equipped with an 18-inch Viking Moniterm I. The image quality was quite comparable. The Nanao monitor was said to cost around $1,000, making the whole 16-color setup roughly equal in price to the monochrome Viking. Image systems has its own line of larger and more expensive monitors, too.

The screen driver software apparently is still in development. A couple of guys were trying to demo a program they've written to create digital embroidery masters for a computer-controlled stitching machine, but they weren't able to get the color system working with it (I did see the software work on the Moniterm). However, they were running a GEM-based assembler on the Image Systems color machine, and it worked fine.

I didn't have a chance to test the big color screen with much software. However, well-written GEM programs seem to work. LakeTerm, a very basic GEM communications program that I wrote with Sozobon C, looked fine. I would expect that the same programs that die on the Viking (such as Tempus) also would die on the Image Systems display.

MicroEMACS 2.19, jShell, UUVIEW and UUREADER all looked good. I didn't count how many lines were displayed, but the field of view was huge.

I noticed a problem on both the Image Systems setup and the Viking Moniterm when the built-in VT52 emulation routines were called upon to scroll the display. That's a LOT of pixels to move, and the rewriting of the screen was quite apparent. On the other hand, with a display that big,

you don't *need* to scroll so often.

Pit Capitain, the author of the ALADIN Mac emulator has replied to a lot of the questions and comments about his offer to release the ALADIN emulator as shareware...

One thing I've been wondering about though, is how exactly was the ALADIN implemented..? Obviously it's a disk based, software emulator.. but, how was the problem of needing Mac ROMs addressed..?

Was a cartridge similar to the Magic Sac offered to hold the ROMs..? Were you required to figure out something on your own to hold the ROMs..? What exactly was a running configuration of ALADIN like..?

From: JJL101@PSUVM.BITNET
Message-ID: <89341.025433JJL101@PSUVM.BITNET>
Source record: 246008

Yes, in reference to all the stuff behind the Form docs, I initially
wrote a request to see if the ASCII docs files were available.....
I am more than happy with what I know of the program, and am grateful
to Jos...
Currently, a lot of us USA'ers without hard drives have DVI displayers,
but I at least do not have all the fonts, and could not possibly have them
all available on floppy, however, I am still interested in the program (yes,
I know a hard drive is 'needed' for Form, but only when memory constraints
warrant it.) Perhaps someone out there could post just exactly what fonts,
and the sizes of such are needed to view the DVI file.

Thanks to all involved here!

3837. RatTrap?

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 08:05:55 UTC
From: hv@uwasa.fi
Message-ID: <1989Dec7.080555.3093@uwasa.fi>
Source record: 246009

Do anyone know where I can ftp a PD program called
rattrap, which should allow me to use menus like in
the Mac (ie. so that they don't drop so easily).

If not ftp perhaps someone can mail it to me.

3838. Modula-2 Algebra System

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 08:16:14 UTC
From: JJL101@PSUVM.BITNET
Message-ID: <89341.031614JJL101@PSUVM.BITNET>
Source record: 246010

Just wondering, before I take the time to download this file, can someone
out there post a generalization of just what the Modula-2 Algebra system does?

Thanks in advance!

3839. Re: Prodigy run under Spectre GCR?

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 08:32:48 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24790@cup.portal.com>
Source record: 246011

HOward C. Johnson asked if anyone had gotten the Prodigy software for the Mac to run under Spectre emulation...

A friend of mine investigated this very question, and found that the Prodigy software, which ran perfectly on a real Mac, wouldn't run on his Spectre. I don't know exactly what the problem was, but my friend was quite disappointed. We've both used the IBM version of Prodigy under the pc-ditto emulator, and while it runs, it's far too slow to be useful.. we'd looked forward to the Mac version since Spectre runs Mac software at full speed (or better). Unfortunately, it seems destined not to be...

3841. Re: The Relevance of the PD FORM docs to the PD distribution of FORM

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 09:12:03 UTC
From: t68@nikhefh.nikhef.nl
Message-ID: <581@nikhefh.nikhef.nl>
Source record: 246013

Concerning the remark about `missing features' in FORM.
The manual of FORM describes the entire FORM 1.0.
The remark about the missing features concerns future
development. A symbolic manipulation program is never realy
finished. You have to stop somewhere and say: 'this is version 1.0'.
Then in later versions there will be more features.
The program as it is distributed is fully self sufficient and
can be used for a very large number of problems.
Suggestions for more features will be very welcome.

From: R.D.Chafer@sysc.salford.ac.UK
Message-ID: <.7.Dec.89.09
Source record: 246014

Dear Netters

I have just read in ST Format (a UK ST magazine, not bad either) that Atari are creating a new software (games) label called ARC. Now the thing is Atari claim they are going to market software for the ST, PC and AMIGA. ST and even PC I can perhaps understand, but AMIGA. I have heard this piece of news rumoured before but now it seems to be fact. Can either Ken or Allan shed any light on this strange happening. ST Format suggested it was designed to get Commodore owners used to buying Atari, seems like a vague and dodgy idea to me.

Robert

>
>Michael Ritzert
>mjr@dmzrzu71.bitnet

This is not a bug. The FORTRAN standard does not require that a common block that is first initialized in a subroutine be saved after the subroutine is exited; although, most FORTRAN implementations do save it. (Sorry, I can't quote the Standard but you can see, for instance, Michael Metcalf's Effective Fortran 77, page 83.)

If you would like to keep the common block around and don't want to clutter up the main program by declaring it there use the save command:

```
subroutine foo(args)
real args,stuff
common/bar/stuff
SAVE /bar/
.
.
.
```

This should work (at least it does in compiler version 2.2).

(It sure is nice to finally see some discussion on a real programming language in this newsgroup :-)

Strange, I've downloaded loads of stuff from a Sys V UNIX machine and it
always works fine - the only time it doesn't is when I forget to set the
'-i' option on the UNIX kermit (for binary mode transfer). There's maybe
something wrong with your UNIX kermit (although I have heard of some
sort of bug in Uniterm's Kermit but it always works OK for me)...

> dlm@druwy.ATT.COM

Dan, I thought that I read about a company that wrote a Mac Toolbox clone for the IBM PC. supposedly, any C code that strictly adhered to the Mac Toolbox rules could be recompiled on an IBM PC. And with suitable PC hardware (color monitor, mouse, or whatever), the application program would execute identically on the PC as on the Mac.

Now, if the ENTIRE PC market isn't big enough to warrant such a mac Toolbox clone, than maybe the USA Atari ST/TT market is! :-) :-) :-)

Anyway, I read about this about a year ago, but haven't heard any more. So, either the product didn't exist or Apple simply bought the company.

Someone could make a good profit by simply STARTING a Mac Toolbox clone, and than selling out to Apple Corp!! :-) ? :-(

there aren't any ads in Phoenix either. None in the Sunday Phoenix Business section. In fact, Computer Works runs a small ad, by themseleves, but it mentions only the Commodore Amiga and not the Atari ST. So, unless you knew that CW Sells Atari stuff, you wouldn't even stop by their store.

Has *ANYONE* out there in NEtland SEEN a Real Live AD for the ST, either on TV or in print?

Just curious.

Wrong, YES, YES, YES (and the compilers are wrong!)

> you can have char *fred[] = "hello";

This is not legal, a correct declaration would be:

char *fred[] = {"hello", "this", "is", "Tuesday"};

an array of pointers to strings.

> or
> char fred[] = {'h','e','l','l','o','\0'};

This is legal, and should be identical to

char fred[] = {"hello"};

or

char fred[] = "hello";

> but not
> char fred[] = "hello";

I have hundreds of examples of this code (properly compiling everywhere).

> char *fred[] is an array of pointers, the first points to the string "hello"

Here braces should be required, though.

> char fred[] is an array of chars, 6 in my example.
>
> Howard C. Johnson

K&R states that the braces are not required if a string constant is used
for initialization, otherwise, they are (Don't have my copy handy, but I'll
look up page and line if anyone is really interested).

I haven't gotten the latest E. Arthur Brown Catalog in, but they used
to carry such a board (or boards). The one I'm thinking of had the
bus completely buffered, all you needed to add was your circuit on the
rest of the board. EABCO (shorthand for the above company) may also have
had an adaptor board that allowed a Radio Shack (non-metric contact
spacing) proto-board to plug onto the bus directly. I don't have
their address, in any case it was posted here recently(2x). I don't know
if they ship overseas, but they provide *very* good service. There
were more sources for protoboards (I too wanted to use the cart port
for my Sr. EE. project, used the parallel port instead <speed wasn't a prob>
8-)), but they disappeared fast.

Bob Pegram (pegram@griffin.uvm-gen.uvm.edu)

On another topic:

P.S. Steve Yelvington: (provider of EABCO address)
I lost my flaming reply to your mention of EABCO (just as well
8-)). I buy from EABCO, I have and use WordWriter's outliner, I will
look into getting foldEd, who's name is suggestive of what I want.
I meant to say that there was a small and shrinking amt of
large *world-class* S/W applications (in the USA). Only in desktop
publishing and music does the ST have leading applications (and
healthy competition), maybe there are a few other examples. I get
envious when I see what PCs and MACs can run. We not only get no new
or updated apps, we have maybe 1 std. app for each major area (Word
Processing,<WP or WordUp> SpreadSheet,<LDW Power>, etc.)and commercial
programming languages and tools are disappearing (no Modula2 to buy,
no Forth either) without the useful/trendy new replacements (e.g. no
OOPs, see earlier queries on the net for G++). Shareware and Pd S/W
don't count, they're what sustains "dead" computers (see US Computer
Shopper's orphan computers section).
I want suggestions as to what *large* type of program do
netters (and friends) want/need that isn't available in native mode

for the ST. Naturally, we also need suggestions on how to make those dreams come true (maybe more imports??!). If there are ways that non-commercial S/W can do the job I'd like to hear about it, but I fear that we'll open Pandora's Box with that one.

> bitnet: Shawl@kuhub.cc.ukans.edu

I left a message on our local Club BBS about moving to a library
and the only response I got back so far (only 2 days) is that maybe
we would be too noisy for a LIbrary. We had a GREAT demo of MIDI
equipment by ROLAND CORP in our November meeting. Roland brought
out a Sales Manager and a Local Sales Rep who were verygood.

Anyway, the comment was made that our MIDI demo would have been too
loud. But I said that we should check out the conference room before
making such a statement. Also, by meeting in the Library, we
could have publicized the MIDI Demo thru the inter-library mags
and maybe had some non-members attend.

So, I still think that meeting in a library will be a big boast.

Message-ID: <891207.10164882.024842@SFA.CP6>
Source record: 246029

Hello all,

With all the flack and so forth that I've been reading concerning
TOS 1.4... maybe I'm doing something wrong--EVERYTHING WORKS! Thanks
to Ken and the others who are and were involved in the TOS 1.4 project.
After having it now for about three weeks, I'm shocked as to how much
faster and snappier my ST. I positively *love* how much faster memory
'drains' from this four megged monster of mine after a power off. Turning
on the ST under 10 seconds after a power-off results in a clean system.
It used to take nearly a minute before. MANY THANKS!!!
File backups are easier with the archive bit installed. THANKS!!!
/AUTO/ multiple program pre-loads just flat haul. THANKS!!!!
All in all, from a "Joe End User" point of view, I feel like I
have a totally different machine. It's speed is amazing to me and I only
have one program out several that is 'broken', that is, Blood Money. I
just can't get it to work but I blame that on Psygnosis's stupid and
idiotic copy protection scheme.
To Ken, Alan, and John, and the many others involved...thanks for
a great job. If only Atari's customer relation department would march
to the beat of your drum...

Greg, which program did you use? What it EasyDraw's OUTPRINT (a GDOS program), and if so did you use GPLUS, and if so which version of GPLUS (the latest is version 1.3 I believe).

>
> 3. I printed the same file from an AT at 10 MHz with an 80287 also at
> 10 MHz (overall NORTON SI = 12.4). and the pic took just over 44 minutes
> printing from GEM Paint. <<< Yeah, 44 MINUTES >>>
>
> The difference is due to transmission speed.

Greg, which printer did you use? Did you use a serial or a parallel printer port?? If serial than at what speed? And comparing a printout on different machines says NOTHING about the speed of the printer UNLESS you use the SAME printer on both machines. Are you saying that you managed to get 300 dpi printouts with the SLM804 on a MSDOS machine? WOW! I am impressed!

>
> Hey, if you really believe in this 11 ppm, 8 ppm, 6 ppm stuff, that lakefront
> property in Canada's Arctic is still for sale and has your name written all
> over it!

Greg, I said in my last post that the MAJOR reason that I sold my SLM804 was that I wanted a laser printer that works under Mac, MSDOS, and ST systems. The KXP4450 does so.

As far as speed, if you would be so kind as to email me a uuencode ZOOed (or ARCed) copy of your picture I would be HAPPY to benchmark it against my KXP4450.

In fact, if folks out there want me to benchmark the KXP4450 against the SLM804, I can do so. My friend still has the SLM804. I can test it on both my 3 year old 520ST (with a meg of RAM), and my 2 year old Mega ST2 (upped to 4 megs). On the Mega, I could test it with the Turbo16 in the Fast and Slow modes.

So, please folks, I am NOT saying that one printer is faster than another. I am simply saying that I will benchmark my new printer against the SLM804 in as identical a system as I can.

And when you are printing on systems, like the Mac and the PC, which DON'T have a FAST DMA port to the printer, the page per minute print speed of the printer is important. So, for my Mac and PC programs, the KXP4450 is faster than the HP LJII or the Brother or the Canon or the whatever.

So, please inorder for me to do a benchmark I nned to know that following:

1) What ST are you using?

2) What TOS are you using?

3) Are you printing using GDOS, GPLUS, or a non-GDOS program?

4) Which FILE are you priinting?

5) How do you time the print job?

If there is interest I will do a benchmark. But as I said, I won't argue which printer is faster. I simply want a laser printer that I can use under Spectre and MSDOS.

Chris, I can't speak for Atari or the programmers there BUT the original TOS
was written on a shoestring budget in a BIG hurray. So, some things wer left out.
The new TOSes are just extensions of the original TOS. Added such features would
increase the size of the ROM code. I can see why, with all the work being done
on the TT's TOS, the ST TOS hasn't been changed dramatically.

In fact, I would rather that Atari incorporate your suggestions into the TT.
Make the TT a super multi-window multi-tasking machine. Make the TT much
more wonderful than the ST.

>
> Shades of the MS Write discussion earlier this year!
Hey, I like MS WRITE!!! I bought it a year ago and for the few letters that
I write MS WRITE is fine.

3859. Problem with Mega 2 Screen Dumps

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 17:00:37 UTC
From: cbz@cbnewsm.ATT.COM
Message-ID: <7384@cbnewsm.ATT.COM>
Source record: 246032

A friend of mine is having trouble doing screen dumps. He has a Mega 2 and an Epson LQ510 24 pin printer. When he tries to dump a drawing from within NeoChrome, using the ALT-HELP command, the result is compressed in the vertical direction. It appears to print each line OK, but the paper does not advance enough after each scan such that the vertical height of the finished printout is only about 1 inch! When printing a text file, everything works just fine. Can anyone offer any suggestions? Thanks.

Questions ???
I wanted to know if it is possible to get a hard disk interface for
a segate 40 meg MFD drive. If so, how much and where. And Would I have any
problems with it working with my atari ???
I was also wondering if anyone was planing on getting rid of a HD. Like
someone want a new bigger faster toy for chiristmas, but need to sell the old
one first. Cause I am looking to add a HD to my atari ???? (Cheep ?)
I also wanted to know about, and where to get, the Apple][e emulator. ??
(Note: I have limited ftp access, this is hopefully going to change Friday ?)
And their was something about TCP/IP, can I get a copy for the atari.
What about that eprom TOS, is it avable ? Can someone send me more info on
it ????
More quesions, what about good chip prices. (I think they should have a
run up - down on the bottom of all computers screens so I can get an acurte and
current quote on chip prices)
Does someone have a list of all archive sites ??
Lastly, I would like info on becomming an registered atari programmer, is
their such a thing ?

Sorry for all the questions at once but I sort of let them get backed up
and the just finaly come out.

Thanks

My address is : (I think this should work, things here are differnt)
bd6%mkvax1@msus1.bitnet
Thanks again

First, let's all support Jos Vermaseren, having a hard time with all the brain-dead Brett "he or she" Maraldos around...

In article <575@nikhefh.nikhef.nl>, t68@nikhefh.nikhef.nl (Jos Vermaseren) writes:
> It uses a customized macro package that was made
> by someone else that makes for a very booklet format when
> printed with two A5 pages on one A4 sheet in landscape
> format.

My question: do you have a program to do this from your dvi, or must I do some fancy photocopy work? Personally, I do not object to your posting of the .dvi, just to your choice of a paper format not easily found in a common laser printer.

Another point:
Richard E. Covert writes:
> Must be some form of Elitest mentatlity to post docs to a program
> in a format that 99% of the people don't use.

Well, forms is intended for maths, and math people use TeX anyways. :-)

PS: and, not all people have troff too now. Try to find a site with "pic" or -me macros... I am sure they are less numerous than TeX sites...

PPS: I distribute GWM with a LaTeX documentation, TeX seems to be really present everywhere...

>that the laptop uses the same plastic as that of motorcyle helmets. Maybe
>so, but I could flex the case. It creaked and would squeak. It did not

As a motorcyclist of long standing, I would have to say that this claim is nonsense. Many, many different plastics are used in mc helmets, with varying degrees of flexibility, strength, shatter resistance, hysteresis, and what have you. If they meant lexan, or one of the engineering thermosetting compounds, then my reaction is "Ho Hum". That's what your description sounds like. They are used in bottom-of-the-line stuff. Middle-of-the-line is usually fibreglass/expoxy; top-of-the-line is generally kevlar/expoxy, and can be very expensive (I paid $440 for my kevlar/epoxy full coverage hat).

Not true. There are many routines that were added to the 128K ROMs that were never made available as disk patches. (For example, there are a lot of Resource Manager extensions and QuickDraw calls.) So a 64K ROM + System Disk does not equal a 128K ROM.

Thats good news! I've dealt with J&R a lot and they always laud the ST and its sales, their systems fly out the door and they are one of the few retailers that heavily push Atari products in full page ads every Tuesday in the New York Times. The Portfolio has been advertised by J&R every week since it was announced! Now if only Atari would keep advertising as they did earlier this year in the NY Times sales might really be something in a city of 7 million without even one authorized Atari service center <grin>.

Boy, do I hesitate to flame, but.....

FLAME ON!

I am one of the minority of end-users who DO buy in order to pro-
gram. Of course I use computers as tools, too.

Several years ago, I bought a Commodore 64 with hopes of enjoy-
ing a cheap hack. After living with it for six months, I gave
it to a university for a tax break (BTW, don't do that unless
you are prepared to receive donation-wheedling letters from
the Dean of Development for years thereafter). Why? Because
it a) wasn't well documented for development and b) didn't work
as claimed in the documentation I could get (serial port inter-
rupts weren't handled properly, among other things).

What a pleasure to have found sources like "De Re Atari" and
the Atari 800 internals manuals (including source code for the
O.S. and BASIC ROMs)! I bought an 800XL, followed by two 130XEs
that I own today. These products have more than met my expecta-
tions, granted that they share a puny processing architecture.
Within my library, I am ALWAYS sure to find definitive guidance
to the way Atari did things. This has saved me lots of trial-
and-error experimentation. It's also allowed me to write smal-
ler, faster programs, since I can, for example, see what sorts
of argument checks I do/don't have to provide before making
O.S. calls.

I've read this Newsgroup keenly for a few weeks now. I had hoped
to find some encouragement for buying into the ST world. In-
stead I've been scared off for the time being. There is too much

talk of under-powered bus fan-outs, inconsistent results with this ROM Rev. or that one, worries about loss of dealer support (BTW, it's GONE in 8-bit Land :-( ), flakey laser printers, and concern for obsolescence of currently owned STs as TTs start shipping. (Could be worse, I guess. My brother owns one of those Amiga things, and it's always crashing. I can't imagine why one would attempt to build a multiprogramming environment around insufficient hardware protection!)

I'm encouraged that Atari Engineering employees are entering this discussion. As a computer company employee myself, I know that Engineering is the soul of the organization: the Marketing guys think that they are in control, but this is a short-term delusion in a world of technology that changes so quickly (I know: I are a Marketing guy). It is worrisome that Ken B. has taken one of the traditional Marketing positions ("users want solutions, not tools or insight"), for he is an Engineering guy. The problem with this position is that it rationalizes (in my view) short-sighted customer support policies. One wonders how expedient (and ruthless?) the Atari Marketing guys must be!

I will watch the unfolding of the TT product line closely. I wonder if Atari Marketing understands in its gut how different the UNIX world's expectations may be from those in place for the ST? MOST UNIX programmers grew up on SOURCE CODE for the O.S. and utilities; they don't bother reading the `man' pages. They learned in University to be very independent and outspoken. They follow a raft of independent UNIX publications (e.g., "UNIX World"), trade shows (Uniforum, UNIX Expo, etc.), and THIS NET. They know how UNIX is "supposed to work" based on their direct prior experience. They view UNIX as an open system, not a proprietary, hardware-dependent system.

This mass market will not view the TT as "power without the price." They will look at it as just another UNIX box, but with some interesting sound and graphics capabilities. They will be very attentive to what the media channels mentioned above say about it. If it's known as an unsupported turkey early on, it won't get another chance in this very competitive marketplace. Never mind how many VARs (value-added resellers of software solutions) may be potentially available to Atari.

I ramble. The point of this is that a quality company cannot rationalize-away product support. And in the brave new world of computer glut (check the WSJ for DEC and IBM layoff news), no one need buy from a low-quality company.

Everyone on this Newsgroup has a vested interest in Atari's success. Atari, please take care of those who love you (yes, even Richard Covert :-)), and we'll take care of you at the shareholders' meetings. We'll make the individual buying decisions that add up to considerable revenue and profit.

I'll meet Ken B. halfway and agree that for products such as the Portfolio and STacey, the simplifying no-support assumption is appropriate and consistent with the long-term health of Atari's business.

So, could there ever be such a thing as a registered ST/TT USER?

FLAME OFF! Replies by email encouraged to conserve bandwidth.

BTW, I agree heartily with Ken B.'s suggestion to write paper letters. Email is ephemeral, but an in-basket of letters is hard to duck and must be explained to The Boss sooner or later.

Jeff

3867. Re: Soz C V1.2 Upgrade help required

> args in the TTP box either. Yet Another Reason To Get Rainbow TOS.
> --
> ||| Ken Badertscher (ames!atari!kbad)
> ||| Atari R&D System Software Engine
> / | \ #include <disclaimer>

One good thing came from that original bug in the Desktop, Dan Wilga
wrote Neodesk. It still supports a proper environment string (which
you have to set up) and probably could run Soz C. So people with and
without TOS 1.4 can run good stuff from a<n excellent> desktop.

Damn news posting program wants more original input, so here's
a short description of NeoDesk. ND replaces the desktop with an
enhanced version, it can remain resident (about 230K) and function
just like the desktop, or it can leave only 21k in Ram as programs
execute, reloading afterwards (slow! w/o pinhed 8-)). It supports
icons for every possible program name or extension, which can be
created in its own icon editor. It improves on the desktop in many
subtle ways: printer icon for printing with spooling, so double clicking on
a non executable icon immediately shows its contents on the screen - it
can run a command interpreter on batch files - it does a correct application
install - allows "program icons" to be placed on the desktop, so you
don't have to shuffle through all your hard drive folders to execute
those programs, has keyboard equivalents for many menu and desktop
operations, and more that I forget (improved disk and file copy,
formatting to real IBM, sets date and time correctly, allows file MOVES...
8-)).

Speaking of reloading and such can anyone tell me why the Laser C (2.1)
shell loads external programs so fast? I run it with Pinhed,
TurboSt 1.6, and TurboDos 1.05, and it beats the desktop and NeoDesk
(2.03) all to pieces.

On speedups and the reverse, I pulled out my HabaWriter 1.1 (the debugged
version) and ran it with TurboST. Very amused to find that TurboST
makes it acceptably fast, but it still won't do double spacing.
TurboSt 1.6 slows one program drastically, Opus 1.? (from STLog), the
lines dividing the cells take forever to draw. TurboST 1.6 (on Monochrome)
also blows up if it's in Multidesk and Neodesk runs afterwards.

>for this. Thanks a lot.

I have a hard disk from Toad Computers, which uses an ICD interface and ICD
software, hooked up to my ST, so I am not sure how much of my experience
will apply to your case. Assuming your hard disk is SCSI device 0,
controller 0, you should be able to get Minix to work without recompiling
the sources. You need to know what partition you want to devote to Minix.
If you don't know, and none of the Supra utilities will tell you how your
hard disk is partitioned, I suggest getting the January, 1989 issue of
STart Magazine, which has a partition lookup program by David Small and/or
Dan Moore. This program runs under GEM, and saved me alot of grief when
I was trying to hook up my hd to minix because the documentation that came with
my hd was incorrect about which SCSI device my drive was set up as.
Once your hard disk is formatted, and you know what partition
you want to use, you need to "mkfs /dev/hd? NNNN", where NNNN is the
number of sectors in that partition divided by 2 (assumes 512 byte sectors),
e.g. NNNN = length of partition in kbytes (1 kbyte = 1024 bytes), and hd?
is hd1,2,3,or4 depending on whether you want to dedicate partition 1,2,3,or4.
The ICD formatting software automatically created 512 byte sectors (I would
assume this is standard for Atari ST hd's, but I could be wrong), and this
worked fine with Minix. If mkfs says it can't do what you ask, it probably
means that your hard disk is not SCSI device 0, but you should already know
whether that's true before you get to this stage (when you find out the
partition info, you should also find out what SCSI device and controller).
If your hd is
not SCSI device 0, controller 0, then you will have to re-compile the
Minix sources to allow for multiple hd's (change NR_DRIVES in kernel/stwini.c)
to be >= number of drives (each SCSI device counts as 2 drives because it
can have 2 controllers). There is also
a note in the ST Minix manual which modifies what I said about NNNN slightly,
so please check there before attempting mkfs.

>I hope I don't sound like a fool.

You don't. I had even more fun than you are going to because I needed to recompile Minix from floppy to look for multiple hard disk drives. In addition to the modification to stwini.c above, I also modified kernel/stdma.c to have all the dmaxxxx subroutines' arguments explicitly declared. Other useful changes on a multiple drive hd system include changing fs/main.c constant RAM_IMAGE to your hd drive,controller # and changing subroutine load_ram to default load the ram disk from hard disk. There are also some modifications that need to be made to Makedev in /dev if you have multiple drives or a drive other than SCSI 0, but these are fairly obvious from the current entries in Makedev and the stwini.c source.

Just in case some of you haven't heard yet, Richard Covert sold his SLM804 Atari laser printer. He replaced it with a Panasonic KXP4450 laser printer. He likes the latter much better.

There, can we PLEASE drop the laser-war? I believe we're all sufficiently educated on the issue by now to make our own decisions intelligently.

> Just curious.

I did, ONCE. I was in the east San Francisco bay area about 3 years ago at my grandfathers house. We were watching TV and an ad came on showing the IBM PC. I talked about its bad user interface. Then a Mac Plus was shown and they made a point about its high price and no color. They then showed an ST using Supra's picture blaster program, pointing out its use of color and low price. Very nice actually, but alas, the only way to see it now is to get to Alpha Centuri before it does.

>or disk needed to run GCC, and MOST ST buyers don't know C. NeXT puts
>GCC with their machine because it's a workstation.

I don't suppose the TT is aimed at the workstation market, but on the other hand, what IS it aimed at? It seems likely that a TT system will cost $3K or more. In the U.S. at least, I guess beyond us hackers who have money to spend I don't see who the buyer is. The ST doesn't have the software base (or at least, it doesn't have the marketing presense) or "pedigree" here to attract many business buyers. $3K is far more than Joe Average Consumer is willing to spend on a computer. And if it isn't bundled with a decent & attractive set of goodies, it might not attract the wealthy hackers either. So who buys it? I'm curious.

I'd much rather have a UUD encoded .arc or .zoo file. They're much
easier to decode, and I can do the decoding reliably on my ST, whereas
I generally decode shar files on a Unix machine. Also, I am another
person that goes through the nuisance of pulling the sources off
comp.sources.atari.st, the binaries off of comp.binaries.atari.st,
decodes them both, and finally combines the result into a single .arc
or .zoo file. It would be nice if this process could be streamlined.

PMR2@PSUVM.BITNET writes:
>What differences are there between TOS and PC-DOS 3.5" disk formats? What do
>I need to do to read files from an IBM disk?

Ideally, the answer is "zero: there is no difference." In practice, you can
always read PC disks on ST's, but you can't always read ST disks on PC's.

This assumes that the disk is readable at all on the ST: PC 1.44MB
disks aren't. Use a format which gives 720K or less.

>Also, can anyone out there tell me what the differences between pc-ditto and
>pc-ditto II are? (Besides $225, of course.)

PC Ditto I is all software: the 68000 runs a program which attempts to
do all the same things as an 8086 and some PC hardware. It's like a
BASIC interpreter, only it's an 8086-machine-code interpreter.

PC Ditto II is hardware: there's actually an 8086 out there to execute
the 8086 instructions. The ST is used for I/O: disk, screen, keyboard,
serial, parallel, etc.

(All this from a man who's never used either product... Informative,
I hope, but not authoritative.)

Eric, I d/led COUNTRY.ARC some time ago to my Mega ST at home and it worked fine. If you need another copy let me know and I will be happy to send it out to you.

It is a really nice country/western song.

I haven't tried it on a 1/2 meg system.

Although Apple's DOS is really (IMHO) messed up, you have to hand it to them for doing a really, really nice job with their graphics and user interface routines. Anyone who suggests that creating an Apple clone would be like creating an IBM clone, do-able by a small group of hackers in their spare time, probably hasn't programmed a Mac. Once you program a Mac, you can really appreciate the time put into that part of their OS when you realize that maintaining windows on the screen in virtually EFFORTLESS. I find myself quite impressed by many aspects of the toolbox, and I realize why the original low-powered Macs were awkward to use and am surprised why it took them so long to implement their OS on a better machine, the Mac II.

If I were writing a clone of the MAC OS, I wouldn't know where to begin.

Dan, we are in the process of getting a Non-Profit status for our club also.
In fact, the previous officers left that for me to do in Jan (thanks :-)).
I have found that Phoenix has a great deal for the use of Library Conference
rooms. We can reserve a room that seats 60 with full AC power and air conditioning
for only five bucks for the morning!!! Quite a deal. If our club grows to your
size I might look into renting space at a Hotel. Thanks for the suggestion.

Our membership dues are $20 per year and include our monthly newsletter and
of course our meetings!! :-)

Good luck with your club. I will send out a copy of our PHAST newsletter to you!

That's great news!!

I was at my local Atari store last weekend when a lady came in that
wanted to buy the STacy with a Spectre-GCR.

I hope that CW gets some of the STacy Spectre-GCRs in soon. Lord Only
Knows that he needs more products!! Henry@CW does OK but I would like
to see him stay in business (so he'll support my Mega :-)). And it
looks like the STacy could be another winner for Atari!!

Hurray!!

P.S. Now if only we could get some more Spectre-GCRs from GBS!!

3885. So what do we really need?

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 21:06:23 UTC
From: esp_05@jhunix.HCF.JHU.EDU
Message-ID: <3568@jhunix.HCF.JHU.EDU>
Source record: 245958

So what is it exactly that we really need? I've heard mention of De Re Atari and OS listings and all sorts of good stuff, shadows from the past. Which brings to mind...

APX. Anyone remember the Atari Program Exchange? From it's demise it could hardly be construed that it was a bad idea--I see its failure as the beginning of the end for the 8-bits. But it was a great thing in its time, and it produced a lot of quality software for a machine that didn't attract much development (sound familiar?).

So what we need is the Atari Program Exchange reincarnated, probably more mature (and thrifty) than it had been in the past.

Any comments on this?

Eric Ruck

3886. Re: Comments on STE -- (un)known facts

> configuration options, and with values for the cookies that describe
> what's actually there.

The "Cookie Jar" sounds to be similar to the "WIMP" directive that
was (is?) in P/OS running on the DEC Professional series (325, 350, 380).
WIMP stood for "What's In My Professional?". I'm glad that you folks
have finally caught up with 1982 in that area, though you're still back
in the mid-to-late 70's with most of TOS, and the early to mid 80's with GEM.

Will the "Cookie Jar" ever appear in a revision to TOS for the older machines?
Is there a reasonable way to detect that there is no cookie jar on a machine
which a program can use? If it is a new XBIOS style function, the return
value from the call to the system service would be a value indicating that
an illegal function was called, which is enough to tell the program that
there are no cookies. If calling this function on an older OS causes a
buss error or similar unpredictable or unacceptable behavior, I'll be VERY
dissapointed.

3887. TeX and professional documentation for the ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-07 21:55:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8912080827.AA01524@ucbvax.Berkeley.EDU>
Source record: 245960

The recent ruckus about the docs for FORM program has brought to light a lot of misconceptions about TeX. I personally view *.TeX files as a preferred form of documentations for the following reasons:

1). They can be read with any ASCII text editor.

2). They are the ONLY method that an Atari ST user has available to typseset mathematics.

3). The structure of a TeX document as described by the relationships of its parts with one another is rigorously defined.

4). The output on an SLM804 laser printer is simply beautiful.

4). It is the only package on the ST that is capable of printing documents of any significant length without stopping for anything but reloading paper.

5). They can be output on a wide variety of other engines if the user does not have the requisite tools at his/her Atari workstation

No other combination of desktop publishing and word processing software for the ST can make a similar claim.

I must, however, agree with those who feel that Jos. Vermasern should have distributed the .TEX file rather than the .DVI file. Mr Vermasern's comment on this matter indicates that he somehow allowed himself to get dragged into some situations that represent poor publishing practice, whether done with TeX, Publisher ST, or Calamus.

I think it would be desirable to encourage further publication of documentation in TeX form. Simon Poole's Uniterm manual was an excellent example of what can be achieved this way. In doing so, however, the authors should think of the following guidelines:

a). Keep it simple. Don't use any more special constructs than you have to. If you need to modify the basic LaTeX constructs do so sparingly.

b). Always provide the TeX source so that users can, when necessary, adapt the manuscript to the limitations of their environments. Paper size is one trivial example. Type fonts are another.

I have printed out several documents that I obtained from local mathematicians to test the TeX implementation being distributed by Current Notes. I have found that sticking to the above prescriptions results in something that is really no more difficult to use than ARC

or ZOO. With this implementation of TeX the Atari ST can hold its head high in some very sophisticated company.

People who squawk about the amount of disk space required by TeX should realize that it is not really any worse than that tied up by Ultrascript and it is not too much worse than what you have to go through to bring up Publisher ST.

> Richard E. Covert (covertr@gtephx)

Don't know if this is what you are referring to or not, but in the 6/13/88
issue of InfoWorld was an article on work on Intermedia at Brown University.
I think they used a "Toolbox Emulator" like the one you mention. The
text reads, in part:

"The system originally was created for the IBM RT PC under
Unix 4.2 (with a Macintosh-like user interface) using Cadmac,
a Mac application framework from Cadmus. However, with the
advent of Apple's A/UX and multitasking, the Brown team
was able to move part of the system to the Macintosh II."

So, Cadmac may be the product you were referring to.

<stepping up onto my soapbox now...>

You know, I try to ignore stuff like this, but I just can't this time. I'd send you nasty mail, but I want the people likely to be offended by this to see the response.

First of all, the ST is a personal computer. The "Cookie Jar" is relatively new to that arena. Secondly, how do you know it's 1982 technology if you don't know how it's implemented or even the extent of what it does. I do, by the way but I have been asked not to disclose it until it's made public by Atari and I intend to honor that request. (Even thought I haven't signed the new non-disclosure agreement yet :-) It's quite well done, believe me.

The REAL reason I replied to your posting is that it's offensive. If you ever expect to see more upgrades to TOS, you shjouldn't be discouraging those whose sweat and enthusiasm it will take to make it happen. _SOME_ of us appreciate the things Atari's doing of late (like TOS 1.4, HDX 3.x, cookie jar) and we'd like to continue to see improvements.

If you want to scare Ken B. and others off the net, continue to offend them this way. Remember, they have constraints to work within, not the least of which is compatibility. The three enchancements I mentioned above are fine examples of how Atari (read Atari's engineers) has provided enhancements which increase the value of older machines without being incompatible with old software.

3894. information on prolog?

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 00:58:16 UTC
From: david@batserver.cs.uq.oz
Message-ID: <2346@moondance.cs.uq.oz>
Source record: 245967

Hi there,
I am looking for a prolog system for my ST (1040, mono monitor,
no hard disk) but have little idea of what is available and its cost.
I would prefer a `Clocksin and Mellish' compatible implementation,
and some kind of external database facility (such as in Turbo Prolog)
would be useful.
Any recommendations, anyone?
Many thanks,

David Duke.

Any opinion expressed above is merely an illusion on the part of the reader.

I also work with a VAX (or VAXen) - an 8650 and a 750. I had problems with
a few versions of Kermit when downloading binaries, due to delays in escaping
to local mode and starting the receive. What worked for me was setting the
VAX Kermit to server mode and using GET from Uniterm's Kermit server command
menu (both Kermits having been set to binary type). I could never do that
previously, as other Kermit versions (including CKermit from terminator) did
not do a reliable job when taking the VAX Kermit out of server mode, but the
Uniterm Kermit does so with no trouble at all.

Hope this helps!

>that can run in monochrome? Oh, BTW, tell me where I can get them.

Yes! and I am looking for a REAL old game... it is called ``Omega Race''
I really loved that game and I was wondering if there was anything like
it for the Atari ST (mono preferred!)

3897. New Comp.sys.atari.st.xxxx --- Lets Discuss

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 03:49:04 UTC
From: rdr@mdavcr.UUCP
Message-ID: <696@acrux.mdavcr.UUCP>
Source record: 245970

[sorry Canada - should have dist = world first time around]

[Sorry about skipping "keywords"]

I have noticed that Comp.sys.atari.st, probably like most sys newsgroups,
serves as a multi-purpose forum.

A. Discussion of Atari St Past, Present, and Future.
B. Off the cuff advice on hardware/software/etc.
C. Pearls of wisdom which should be saved for all time.
D. Etc.

I would like to purpose that we (the readers of Comp.sys.atari.st)
divid the newsgroup up into an unmoderated discuss group and a
moderated advice group (with, maybe, and question and answer group
on the side). The advice group would be intended for
those pearls of wisdom, and would be archived, index, etc, for
the masses and the years.

Perhaps we could name the new groups

Comp.sys.atari.st.d = discuss and unmoderated
free forum

Comp.sys.atari.st.a = advice and moderated
archived, index, etc
maybe
Comp.sys.atari.st.h = help and unmoderated
qustion and answers

This not an offical call for discuss for creation and renaming of
newsgroups becuase there is a few issues to be worked out.

1) Who is to moderate
2) Where can we archive
3) What are the newsgroup names to be
4) Whether this is a good idea
5) etc.

I am not an expert on any facet of Atari St, but, since I am not one
of those talkers (and not doers) I will volunteer to be moderator of
the new newsgroup. I suggest that I am not the bestperson for this
job. If you think you would do better, please volunteer. (Really,
someone from Atari should do this - but they (Atari) would have to
promise not to bias the newsgroup towards Atari's own add-on products).

I can not archive the newsgroup.

If there is enough feed make on this issue - I will put together
a proper usenet proposal.

3900. 2600 track=mouse conversion

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 05:18:19 UTC
From: psurge@cs.utexas.edu
Message-ID: <7315@cs.utexas.edu>
Source record: 245973

On November 27, 1989, Bruce Blaner gave instructions for changing the 2600 trackball to a mouse on the ST.

Here is an update to that modification:

I assume he was refering to the CX22 trackball, which I just modified using his instructions. However, it was noted that only the left button would be usable with the trackball. What follows is a description on how to modify the right button on the trackball to be the right mouse button.

First, cut the RED wire that leads from the left button to the right. if you notice, both buttons are connected through a black and a red wire, cut only the red one and cut it close to the left button.
Lead that wire out the back of the trackball and
close the case, we are now through with the internal modifications.

Now you must cut open the connector on the other end, being carful not to cut any of the wires. Inside you should find a plastic block with all the wires running in. You will be inserting the wire (you will need to extend it) into hole number nine. Looking at the CONNECTOR, not the port, the holes are as follows:

```
-------------
\ 5 4 3 2 1 /
\ 9 8 7 6 /
---------
```

There might be some kind of plastic plug going into that hole. BE CAREFUL, don't pull out any of the other wires, you might not be able to put them back in! If in doubt, look in any reference manual such as ST Internals. Remember to check if you are look at the PORT or the CONNECTOR. You want to get the wire to hook to the PORTS pin 9.

Now when you have room, shove your wire (with bare end, of course!) as far as it will go into that hole. Tape everything back up with electrical tape as tight as you can, then tape the extra wire along the cord back to the trackball unit to keep it from being pulled out. Plug in your trackball and see if the right button will now work (Interlink uses the right button extensively, but from the desktop you use it to access something in a window other than the active window.)

Normal disclaimers apply, I did this mod in 5 minutes after I modified my trackball, so it really isn't that hard, just be sure not to force any wires out of the jack when cutting it open. Please don't blame me if you screw up your connector, Use this mod at your own risk.

Feel free to write if you have any questions about this mod. I thank Bruce Blanar for his original description on modifying the trackball, it makes an excellent "remote" mouse. Now you can use those program which require the right button also.

> results.
>
> Michael Ritzert

Ad 1). An input redirection from a decent shell should do the trick
(my makefiles do something like 'echo "a $whatever" > aap;
f77lib lib < aap')

Ad 2). This is as defined in the Standard, though Absoft seems to be the
only one taking the liberty. The 'SAVE' option might work, I always
have a main program with all common blocks which just calls the former
main as a subroutine. Much easier debugging too.

New). I cowrote a little linker for Absoft which is ~30 times faster than
theirs and does not have the EXTERNAL bug. It is commandline oriented
because I use 'make' all the time. The only feature lacking is support
for BLOCK DATA in libraries.
Would there be interest in this as a shareware product?

3903. GCC times(2) & #define HZ tech query

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 12:38:37 UTC
From: gjh@otter.hpl.hp.com
Message-ID: <570049@otter.hpl.hp.com>
Source record: 245976

Can anyone enlighten me on the following technical query?

The C system call "times(2)" -- my SysV manual states:

"The times are in units of 1/HZ seconds, where HZ is processor dependent (see <sys/param.h>)."

The sys/param.h from J.Bammi's port of GCC to the ST doesn't have a definition for HZ.

My local Sun's sys/param.h file defines it as:

```
#define HZ 60
/* ticks/second according to syscalls that return values in ticks */
```

My HP9000/350 defines it as:

```
#define HZ 50
/* Ticks/second of the clock (in kernel land) */
```

Can anyone provide me with an appropriate value for HZ for an (unaccelerated) ST?

Background ...

I have a Prolog benchmark indicating a (literally) incredibly slow ST performance level and here there's a caveat, the benchmark README file contains the following warning:

```
WARNING: Naive reverse is the classical benchmark for
computing "LIPS" (Logical Inferences Per Second),
but it's such a small benchmark that LIPS numbers
so obtained may not necessarily reflect overall system
performance, and should be taken with a large pinch of salt.
```

However -- on my HP9000/350, the same benchmark (run by the same Prolog) indicates a performance level of 30KLips whereas the ST can apparently run only 1.5KLips!. I was surprised at (and suspicious of) the size of the difference in apparent performance. I know they said "should be taken with a large pinch of salt", but this requires a cartload!

Crude stopwatch timing indicates that the ST performs the benchmark in ~40 secs, the HP9000/350 in ~10 secs. From those crude timings, the ST benchmark indicator should be around 5 to 6KLips, not 1.5KLips. So, perhaps a problem with times(2) ??

The Prolog is SUNY/UArizona's StonyBrook Prolog, GCC-cross-compiled to ST. The benchmark relies upon a "cputime" function ---

```
int msec;
struct tms t;
times(&t);
msec = t.tms_utime * 1000 / 60;
```

which is supposed to return the cpu time in millseconds.

Can anyone tell me is this appropriate for GCC for the ST? --- it *looks*
plausible, but the times don't seem to pan out properly?

If I can fix this, I'll make the ST port of Stony Brook Prolog available.

Cheers,

Graham

From: markhof@exunido.uucp
Message-ID: <1817@laura.UUCP>
Source record: 245977

Hi!

It's nice to get PD Software through the net. But it's not very nice
the all you know about the things in COMP.BINARIES.ATARI.ST is their
titel. - Until you copy them to your ATARI, decode and unpack them.
This is a lot of work. After that, you might see that you're not interested
in that you got. :-(

So, please all you people which put Software in COMP.BINARIES.ATARI.ST,
please comment them! A few word may be enough. Better: Put the (usually
existing) READ.ME or .DOC File in front of the binaries!

Thanks!

Has anybody had the possibility of working with the Stacey display? I heard that it is pretty bad and that it is better to wait for an upgrade. Is this true?

3908. WordWriter Paragraph format

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 15:10:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8912090807.AA21724@ucbvax.Berkeley.EDU>
Source record: 245981

If you have hard returns at the end of lines (i.e, you hit return to end each line rather than auto wrap or you imported an ascii file) then the format (F10) will not work.

There is a PD program called 1ST_CVRT which will read ascii files and add soft returns in place of hard returns. Once you have soft returns, the paragraph format will work fine. I used WordWriter for over two years and can say with all honesty that paragraph format DOES work.

I switched to 1ST Word Plus because WW lacked a goto page and WW popped to the top of a doc on a save operation. However, I miss WW's dictionary - I've used Word 4.0 on a Mac, WordPerfect on a PC and 1ST Word Plus on the ST and none of them have the spell check capability of WW.

Thanks Bill, but I have been trying to change things. First, since I was so unhappy with my SLM804 I sold it and bought a laser printer that I am happy with. This eliminates a lot of aggrevations in my life, with Spectre 128 (which I have ALWAYS loved, I just hated not having a printer for it!), and other stuff.

I have also been elected Prez of the Phoenix Atari ST club, in which I hope to encourage other STers in Phoenix to join. A good friend is now Vice President. We are planning to have an Atari Rep
visit soon, either this month or in January. We are planning to move (well I am anyway :-)), and than start a membership drive. We are planning to incorporate as a non-profit organization in January.

I will be having more fun using Spectre 128 now, and may even buy pc ditto II when it comes out. Jim Allen is waiting to see if pc ditto II works with his Turbo16 accelerator. I hope that pc ditto II works with the T16.

I am returning my WERCs disk + $5 to Michtron for an update. WERCS is an excellent Resource Editor, but I bought an old version last year, which has since been updated by HiSoft (and distributed by Michtron). Thanks Michtron.

I am returning my Calamus for the update to version 1.10, which should be out soon. I am still waiting for my PageStream 1.8, and need to write Softlogik a letter about that. My update check cleared my bank over a month ago, but I still haven't

received my PgS 1.8.

And I am writing a couple of new programs, one of which I hope to sell commerically. It is a utility similar to a Mac program that I saw.

So, while I am still not happy with the specs of the TT, I am much more satisfied with my ST now that I changed laser printers.

so, have fun out there and have a good holiday.

3911. Printing speed

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 15:45:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8912090808.AA21805@ucbvax.Berkeley.EDU>
Source record: 245984

Rich:

The printout on the PC was to an HP LaserJet II via a parallel port. That's why I said that transmission speed was the determining factor. The point I wanted to raise was that unless you are sending ascii characters to a laser printer via a parallel port and using the printer's fonts (soft or hard) that pages per minute is a useless value to quote. Pages of graphics per minute (bitmapped or PostScript/UltraScript) is the topic of speed to discuss.

Apparently, Tramiel squashed the idea of putting out a board for the PC that would allow the PC to use the SLM804 because he did not want to support PCs - then again, that makes no sense for a company that markets PC clones.

The order of speed for the ST environment is

1. GDOS + ST + SLM804
2. UltraScript + ST + SLM804
3. PostScript + ST + HP LaserJet with PS board via parallel or serial
4. bitmapped + ST + HP Laserjet without PS support

4. is so far behind the others (that was the 44 minute job I referred to) that it is not an option you want to consider.

3912. Rainbow Tos availability to people without dealers

> / | \ #include <disclaimer>

Ken and John,

Before I say anything else.... THANK YOU for being here so that we get SOME information about hardware, software, new stuff, etc. The magazines all seem to be disappearing but some of us want to continue using our machines and need up to date info on them. Again thanks...

That out of the way....

I just called Atari Customer Relations, (4:00 pm 12-6-89) after reading this message. I reached a very pleasant voice (sorry I didn't get her name), that informed me that NOWHERE in the NORTHEAST can I buy the Rainbow TOS upgrade and could not buy it direct ... only from a dealer. She rattled off a list that included a place in KANSAS CITY. I am not likely to be going there soon and don't want to travel there to buy computer equipment. To be fair she did mention a place in CORAM NY, which from the 516 area code sounds like it is upstate somewhere.

I am in eastern Connecticut and there are no dealers near here. The only shop that I guess WAS a registered dealer at one time is about 60 miles from here. That is not a problem. He informs me, however, that Atari told him that he could not get the Rainbow TOS unless it was with Desktop Publishing Systems. That really is too bad because he runs a very good place, stocks a fair bit of software, has a few pieces of hardware and continues to do hardware repair for the machines. I think though that he has lost interest in doing business with Atari.

I am not here to bitch about Atari and its problems however. I just wanted to let you know that there doesn't seem to be a way to distribute

the new TOS to people who do not have dealers near them. I don't really expect you to be able to do anything about it. I doubt that that is in your job description. I just wanted to let you know that your previous posting seems inaccurate.

By the way, I happened to think my Atari 520ST is real useful. I have added a 50Mb drive and just today bought an Aerco memory upgrade for it from my "LOCAL" dealer. It was worth the 60 mile drive. The machine is not the be all and end all of computers, but fits my needs for the moment.

P.S. It is EXTREMELY gratifying to see professionally wrought software being produced for the Atari ST. In light of this thanks to Jos Vermaseren for FORM. I wish I could figure out a way to get the local dvi to alw (apple laserwriter) program to process this. It seems to need a preamble or postamble or something like that. Hey.. I am just learning TeX and it is slow going.

Terribly sorry, Keith. I thought I'd put that in the posting but I guess I forgot.

A friend of mine is an Amiga developer, and he told me that Commodore/Amiga people were telling their developers on the BIX developer's conference that the Amiga is the LYNX development system. This was only a few days ago.

What I know for sure is that some of the Epyx people working on the LYNX used to work on the Amiga for Commodore, and when Atari saved the LYNX from going under with Epyx'x demise, the project was set in stone.

I do not know if it was someone employed by Commodore who posted this information, or just someone on the closed developer's conference on BIX.

I don't mean to make the Atari we all know and love to look bad, I just thought it was kinda interesting.

>
> Thank You,
> Gregory Gibson

Paragraph format works, but you may not understand what Word Writer
thinks is a paragraph. If you type carriage return, that marks the
end of the paragraph. Just type in your text without hitting carriage
return and let Word Writer break the lines for you.

By the way, the carriage returns it puts in are followed by a space,
so Word Writer can distinguish its line breaks from the carriage returns
that mark the ends of paragraphs. If you delete the space
after a carriage return, you will turn the line break into a paragraph
end.

3917. Appraisal of FORM (was Re: The Relevance of the FORM)

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 17:37:54 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <346@watserv1.waterloo.edu>
Source record: 245990

I have been learning FORM and I must say that it is absolutely
wonderful. I can't believe it was released PD. For a little over 100K,
FORM is *very& powerful. I have been using it to manipulate some simple
gravitational field tensor equations. One question concerning the
wildcard ?: if we have n defined as a symbol and v defined as a function,
does n? mean any symbol and v? mean any function? If do, declaring
n and s to be symbols, does n? = s? ?

3918. Day One with my new KXP4450 laser printer

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 17:48:00 UTC
From: covertr@force.UUCP
Message-ID: <474e7b5f.14a1f@force.UUCP>
Source record: 245991

TO GREG LINDAHL: PRESS 'n' NOW AND SAVE YOURSELF SOME GRIEF AS I AM GOING TO TALK MORE ABOUT MY NEW PANASONIC KXP445 LASER PRINTER, AND I KNOW THAT YOU DON'T WANT TO READ THIS MESSAGE. REC.

Before Day One Or the Day of the Panasonic KX-P4450

I checked around and found a mail order company in San Jose CA that had both the Panasonic KX-P4450 laser printer and the 1 meg memory board for it in stock at a lower price than I could buy locally in Phoenix. So, on Monday Before Day One I ordered the KXP4450. I ordered it COD and had it routed to a friendly local Mail Boxes Etc USA store. I than eagerly awaited my new laser printer.

Thursday, Day One
Imagine my excitement when at 11:15 am on Thursday I got a call from Mail Boexes Etc. that my KXP4450 ad arrived. I rush over to pick it up during lunch. It came in two boxes, with the printer in one big box, and the paper trays and supplies in a smaller box. I open the small box and retrieve the Operating Instructions Manual, which I took back to work.

Day One 5 P.M.
I get off work and go home to play with the laser printer. The manual indicates that I have to install the Developer Drum, the Optical Drum ,and some toner. The manual is very clear, and the internal mechnical layout of the XKP4450 leaves no doubt as how to install the two drums. They simply slide in; very nice. The toner is poured from a bottle, with a nice little spout, into a reservoir on the top of the printer. The memory board is installed inside the top of the printer and requires a Phillips type screwdriver. The memory board uses the 256K SIMM DRAM chips. After fifteen minutes, I have the KXP4450 buttoned up and powered on.

Before attaching the KXP4450 to my Mega I do a Status SelfCheck, which confirms that everything is operational. I than attach the printer thru a parallel port cable to the Mega ST. I set the printer to Epson emulation, and do a screen dump. Imagine my shock when nothing prints out. I wonder, is the parallel cable bad, is the parallel interface in the printer bad? So, I locate a text file, and PRINT it from the Desktop. I notice activity on the printer indicator, so I know that the printer is getting data. After about 30 seconds the mouse is active again and I start getting paper printed. And was it FAST. I printed 20 pages amost as quick as they could be layed down. Now, when I printed text with my SLM804, I could count between pages. With this printer, once the data reaches the printer and starts printing the pages are dumped noticably quicker than the SLM804.

Other things I noticed once I got the KXP4450 is that it is slightly larger than my SLM804 so I need to rearrange my computer room. I may buy a different

printer stand for it. But as the KXP4450 interfaces to my STs via a parallel port, I can use a Centronics A-B Switch box to allow both of my STs to print to the 4450. That is something that I couldn't do with my SLM. So, I shop for a new printer stand this weekend.

Word Perfect is supposed to have a printer driver for the KXP4450, and has downloadable soft fonts for it. I am still investigating this. I may switch from MS WRITE to WP now that I have a printer that is supported by WP. The downloadable soft fonts would allow me to make text printouts from the desktop in various fonts as well. That is something I could only do with GDOS with the SLM804 laser printer. Hey, you can't download fonts to a laser printer which doesn't have a cpu and memory, right?

So, what elese is there for me to learn about the 4450? Well, I used a program called FRONT&BACK to print out double sided text, and the 4450's builtin font isn't 66 line per page. Or soemthing, because we I tried to use F&B to print out a text file, the page breaks didn't agree with the printer. I need to check this.

I also need to see about a good GDOS printer driver for the 4450. I need either a Panasonic KXP4450 driver or a LaserjetPlus driver. A 4450 driver that knows about the dual paper trays would be nice. Anyway, once I get a LJ+ GDOS printer driver I can use Manual Maker (by Craig Daymon on GEnie) and IMG CAT again.

I need to reinstall Calamus and PageStream because would I last installed them I deleted all of the unnecessary (such as LJ+) printer drivers, and left only the SLM804 drivers on my hard disk. So, time to reinstall and then try them out.

I also want to try out the 4450 in my Mac Spectre. I need to buy a LJ+ printer driver for my Spectre. Once I do that I can print at 300 dpi under Spectre. I am looking for a place to buy a program called Mac Flow. Mac Flow is a flow charting program which my friends tell me is great. With my new printer I can finally use some of these mac programs and still get great printouts. I am very excited about Spectre 128/Spectre GCR now that I can finally get decent printouts.

And finally I need to see if pc ditto II ever comes out. I know that most MSDOS programs support the LJ+ printer, so I am in business with my 4450!

All in all, my first evening, with all of the hints of the power and flexibility of my new printer, was very exciting. The fact that I can emulate both macs and pcs, and that now I can finally print in full laser quality, on both systems is very exciting. makes me want to keep my ST around for awhile longer!

Now, if the TT were to come out, and Dave Small could emulate the Mac IIci on it with the new Mac IIci QuickDraw ROMs and the new Mac System 7 operating system and MultiFinder, maybe the TT could have a slight future. Imagine, the TT as a Mac IIci clone!! WOW! And if Jim Allen were to provide an accelerator for the TT, maybe bumping it up to 32 MHZ, we could have a killer Mac clone!!

Did someone mention Intermedia?? Why that's made by IRIS at Brown, and by golly that's where I work!
A company called Cadmus reverse enginered the toolbox, the product called CadMac. Upon completing that task, they soon went out of business and Apple bought up all the rights to it. IRIS was the only place that still has the rights to use CadMac (though we don't anymore).
The product that I think Tim was talking about was a cross compiling system that emulated toolbox routines on the IBM PC. By taking legal-working
Mac C source code and compiling it with this special compiler, you could get it to run on the PC. I'm assuming that they wrote their own windowing system and look and such but basically used the same names and arguments in their toolbox as in the Mac. It was big about a 1 year ago and haven't heard much since.

Maybe, maybe not. A 'usually reliable source' told me the STacy passed class A certification, but not class B. This would mean it could be sold for business (including musical performance) use, but not for home use. Anyone know for sure? Steve J.

3921. New Atari Developers Package

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 19:33:14 UTC

I don't have TOS 1.4 yet. The biggest problem I have with European
games is a lot of them only work in 50 Hz mode. The older color monitors
can handle both 50 and 60 Hz signals, but my Atari color monitor, one
of the newer ones with the power button on the front, apparently
cannot handle.
Does anyone have a little patch program that runs in the background
and constantly puts the computer in 60Hz mode. I've tried writing
one with no luck. I guess, though, that if it did work, the game
would start running into timing problems.

WHY DID ATARI DO THIS WITH THE MONITORS?

3923. GNU-C configuration info wanted

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 20:22:32 UTC
From: dag@per2.UUCP
Message-ID: <882@per2.UUCP>
Source record: 245996

I've recently FTP'ed the binaries for GNU-C 1.35 and the 1.36 executable zoo from the Terminator archive and have attempted to use it for building NetHack 3.0 pl 3 according to the makefile and other docs (makefile.tos and install.dos) and have come up with a few problems: (The notation [*] is used when a given number (1=[*], 2=[**], etc.) of bombs accompanied the failure)

The compiler does not seem to like "#include <sys/whatever>"
I had to change these all to "#include <sys\whatever>".

Makedefs.prg does not work correctly -- it appears to be a problem with the printf function in the gcc library on terminator which makes %d (in the 16 bit library) display (and consume from the stack) long values. Also, the freopen seems always to fail [**]. I hacked around this problem and then came to problem # 3 --

The make dies about 2/3 of the way through do to file-not-found's from #include directives. Restarting the make with appropriate changes to the makefile got me through to having all of the files compiled. Then

Gld died (***) when invoked from the makefile. Some of this seems to be because of too many arguments on the command line. I searched the sources for an older version of gld and discovered that I could create a file containing the names of objects to be linked and use "@linkfile" on the gld command line to use it.

Once I finally got a nethack.ttp file out of all of this (after several days of hair pulling and head banging), attempting to run that file didn't work (**).

Has anybody put together a configuration of GCC running on an ST that works?

My set-up is a Mega ST-4 with 68 meg of hard disk, TOS 1.2 and a Mono-monitor. I have FOLDR400.PRG in my auto directory, and I run gnu-make from under a modified MWC shell.

I've read of an improved and fixed library available on "bammi's machine", but my FTP site has never heard of it by the name I have for it, and no number was given for that site. Someone should put the updated libraries on terminator with the other ST specific GNU stuff. The "\" vs "/" stuff seems to be a difference in CPP versions. I can find no documentation on gld, gas, or the GNU C library. I have TeX/LaTeX and texinfo.tex, a laser printer and the associated DVI-to-laser program so I can print out any documentation from the .texinfo sources, if they exist.

Can anyone give me pointers, descriptions, how-to's or other advice?
I've got TOS 1.4 on order, and will install it sometime in the next two
weeks (I hope).

I can be reached directly via uucp mail at uwvax!per2!dag. uusend does
not work to this site, so please don't try it. I have FTP access through
a guest account on a machine nearby.

Thanks in advance --

3924. ST version of Mac Flow??

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 20:32:40 UTC
From: covertr@force.UUCP
Message-ID: <474f0e9f.14a1f@force.UUCP>
Source record: 245997

One program that I haven't seen for the ST that is available for the Mac is a good software flowcharting program. I have talked to a Mac friend who described Mac Flow to me. It is a true flowchart drawing program. You can bundle objects together, such as a decision diamond and its input and answer arrows, so that if you move the decision diamond, all of its arrows move with it.

It would be nice if the flowcharting program could draw flowcharts from my C code as well. I know that there are MSDOS programs to do this.

So, does anyone in Europe (Germany) know of a good ST flowcharting program?

3925. Nethack from c.b.a.st on Mega ST 4

Newsgroup: comp.sys.atari.st
Date: 1989-12-08 20:36:50 UTC
From: dag@per2.UUCP
Message-ID: <883@per2.UUCP>
Source record: 245998

A month ago I purchased an Atari Mega ST-4 to replace my VERY OLD
(June 1985) 520ST (expanded to 1 megabyte). I am very pleased with
the greater memory and better packaging, however I cannot get some
programs to run on the Mega.

I understand this in programs that access undocumented locations in
low RAM or in the ROMs, and for programs that run off the end of memory
in funny ways, but the this (the following problem) has me baffled --

I can't run the nethack.ttp posted to comp.binaries.atari.st
last summer.

More accurately, I can run it, but when it gets past the preliminary
(set-up) dialog, I get an address error (or is it a buss error, I can't
remember right now). I've running with all sorts of different setups
of auto and driver programs, but to no avail. If I unplug the hard drive
from my mega and plug it into the old 520, nethack.ttp runs fine.

Are there any known problems with Mega TOS w.r.t. the C runtime library
used in building this nethack executable which did not exist in the
older ROM TOS versions? Is this also a problem with TOS 1.4? I've
attempted to rebuild nethack from sources with GCC, but to no avail
(see a previous posting about this problem).

>downloading capabilities, you had to send money to the programmer.

I've been using STalker for all my communications for a year
or so, and recently upgraded to v2.03. STalker is a desk
accessory terminal emulator (vt52/100) which features a very
flexible background autodialer (handy when you don't want to tie
up your system trying to get onto a busy system), a scrollable
virtual screen which is configurable to any size you want,
limited function key macros, and ASCII/Xmodem/Xmodem-1K uploads
and ASCII/Xmodem/Ymodem-batch downloads in the background with
any GEM application. The most recent version also includes
STeno, a basic text editor accessory with hooks into STalker. (I
don't use it myself, since I spend most of the day in Word
Perfect.) The main reasons I use STalker are: I really like
having my communications program a mouse-stroke away; being able
to view my terminal session in one window while using Word
Perfect in another (as I'm doing now) is great; and being able to
download large files without tying up my machine for hours is a
godsend. I think I paid $35 Cdn for the original version, and
$15 for the upgrade.
A couple of comments on Steve's comments:

>It looked pretty good. However, the background operation was based on
>GEM pseudomultitasking. This means that any non-AES operations will bring
>the background task to a screeching halt. For example, I could upload to a
>BBS quiet easily while running GEM First Word, but as soon as I fired up
>MicroEMACS, a compiler, or even a command shell, the system halted because

Right; STalker will not work in the background with most non-GEM
applications. (It _will_ run in the background with the most
recent version of MicroEMACS, however; I can't remember the
version number, but it's the one that uses the mouse. Not sure
we can generalize here, but any application which uses the mouse
should be a good bet for use with STalker.) This isn't really a
problem for me, since as I mentioned, I spend most of the day in

Word Perfect. But be forewarned.

>STALKER is a desk accessory, with all the limitations that accrue thereto.
>As I recall, the size of the file to be transferred was limited by a static
>buffer. The reason for this is that a GEM DA doesn't own any file handles;

Nope. I think you must be confusing STalker with Shadow,
Double Click Software's background transfer utility. Shadow
requires you to allocate a fixed amount of buffer space at
startup, and writes to disk only when the transfer is complete.
This has the advantage of making transfers "reset-proof", but the
disadvantage of tying up large amounts of memory, particularly
when you anticipate downloading large files. By contrast,
STalker writes to disk whenever its transfer buffer is full, and
can be configured with a transfer buffer as small as 4K. (BTW,
the most recent version of STalker takes advantage of Shadow's
hooks, so you can use Shadow's background routines with STalker
if you really want to. It also supports Double Click's multiple
rs232 port gizmo, so if you've got a pair of modems you can
install two copies of STalker, and have two terminal sessions
running in the background at the same time! It can also be
configured to work with the midi port, though whether this would
allow hanging an additional modem off the midi port is beyond
me.)
As an accessory, STalker does use memory. A minimum
configuration burns about 90K. This still allows me to allocate
a 200K ramdisk at startup and run Word Perfect with room to spare
on my unadorned 1040ST, so I can't complain.
SO: If you spend a lot of time in non-GEM applications and
don't mind setting aside a large chunk of RAM at startup, check
out Shadow. If you use mostly GEM applications and like the idea
of having background communications at your fingertips, I highly
recommend STalker. Make no mistake: STalker is nowhere near as
full-featured as Uniterm or even Flash. I used to be a die-hard
Uniterm user, and never thought I'd be tempted to use anything
else; but STalker is so damn handy (for me!) that I haven't
dusted off my Uniterm disk in months. STalker is written by Eric
Rosenquist and marketed by:

Strata Software
94 Rowe Drive
Kanata, Ontario, Canada
K2L 3Y9 (613) 591-1922

Needless to say, I have no pecuniary interest in Strata Software
(or anything else for that matter, if my bank account is an
indication).

I know of several ST owners who have no desire to even THINK about programming their STs. The fact that the ST is easy to program does not mean people will always program it.

And, PLEASE, do not assume your limited experience (this is not a flame; I have limited experience in this matter also, as does just about everybody) on people who own STs represents the whole. Sure, the ST might have a larger percentage of programmers, but percentages don't count -- numbers do.

dag@per2.UUCP (Daniel A. Glasser) writes:

| I'm glad that you folks have finally caught up with 1982 in that area [...]

Thank you for slamming us about something which you admit you don't
know about.

| Will the "Cookie Jar" ever appear in a revision to TOS for the older machines?

Not necessary. It's not a function call, it's a service provided by
the startup code, and it isn't necessary on existing machines, because
the services they provide are known. It is possible for people with
exotic devices on older machines to have the drivers for said devices
install a cookie jar in the auto folder, for example.

| Is there a reasonable way to detect that there is no cookie jar on a machine
| which a program can use?

Yes. If the new system variable which points to the Cookie Jar is
zero, you're on an old machine.

| If calling this function on an older OS causes a
| buss error or similar unpredictable or unacceptable behavior, I'll be VERY
| dissapointed.

(Warning, sarcasm ahead)
As everyone knows well from following this news group, it is always our
policy when enhancing the OS to make it as incompatible as we can. If
it was hard to code, it should be hard to use. It was a tough decision
to leave out of the Cookie Jar spec the feature which would have caused
the machine to reboot on older TOS versions, but somehow we resisted
the temptation.

gl8f@bessel.acc.Virginia.EDU (Greg Lindahl) asks:
| what's the best way to save the menu bar?
The menu bar area is the area of the screen _outside_ of that returned by wind_get(0, WF_WORKXYWH, ...). This is in the AES manual, section 11.2 "Using The Window Library", page 11-7.

Thanks, Troy, for the nice comments.

On the subject of adding the right mouse button:
I know adding the right mouse button is not difficult, I just did
not want to include the description in the plans because it involves a
little bit more work and I wanted to keep the post short. Another way
to add the functioning of the 2nd button is to get a joystick extension
cord from somewhere like Radio Shack. That cord brings all nine wires
through so it can be used to replace the one already on the trackball
and connect the right button to the ST. Plus, the cord is longer...
makes a real nice _extension_ mouse.

But, hey, If it works, it works!!! That's all that matters!

Years ago, Atari (Warner) created Atarisoft to publish the same sort of things.

Basically, they just wanted to sell games they had the home rights to,
like Pac-Man, on Apples, 64s, and PCs.

3933. MAIL TO CIS AND MCIMAIL

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 01:37:39 UTC
From: MAXG@SUVM.BITNET
Message-ID: <8912090811.AA22017@ucbvax.Berkeley.EDU>
Source record: 245906

I got the following information from info-mac. It might be useful to some of you out there as well. Please note that the info is old, which seems to mean that the set up has been in place for a while now. I have not used these pathways myself, but based on what others say, they seem to work.

****

To clear up some confusion and squash several dozen rumors which have been floating around since sometime this past Wednesday or thereabouts, I'm telling people about this now, although more official (officious? :-) announcements will be forthcoming sometime Real Soon Now.

CompuServe is email-accessible. The machinery to do so has actually been in place for some months, but there has been an arbitrarily large number of reasons why official, live status has not yet been granted to the gateway. Technically, this is true, even as I write this.

To reach a CompuServe subscriber account of the form
7xxxx,yyy
swap the `,' for `.' and add @compuserve.com:
7xxxx.yyy@compuserve.com
This is necessary for RFC compliance. To reach employees of CompuServe, they have somewhat more typical usernames inside the csi.compuserve.com subdomain.

CompuServe subscribers can reach people Out Here from CompuServe's mailers via the specification:
>internet:user@host.domain
The use of ">stuff:" is CompuServe's general gateway-access syntax; it does not appear in anything on the Internet side of the gateway, but rather RFC-compliant headers are generated.

Internet nameservers for compuserve.com are alive and responding, and pathalias data for a (fictitious) host "compuserve" has been published since last fall. Internet mailers must support MX records in order to reach CompuServe. The MX host is saqqara.cis.ohio-state.edu, a.k.a. osu-cis. I understand that there is some magic that must be performed on BITNET VM hosts in order to get there due to lack of MX support; details from other BITNETters, not me.

[That's 7xxxx.yyy%compuserve.com@saqqara.cis.ohio-state.edu - Ed.]

Saqqara speaks with CompuServe approximately half-hourly, though this will probably change as load is observed.

There are NO charges accrued to ANYBODY on either side of the gateway
for its use. CompuServe subscribers are charged their usual hourly
rates, but there is no gateway-specific surcharge.

The reason for this posting is that the gateway was mentioned rather
casually to info-nets@think.com, resulting in a rather impressive
flurry of queries, explanations, and test notes through the gateway.
The load has been, ah, remarkable. There were quite a number of
misconceptions about it (notably regarding charging, there being none
but others claiming that there would be), and I am hoping to prevent
further rumor-mongering. Vint Cerf presented this on CompuServe's
behalf to FRICC just this past Monday; there is "agreement in
principle" on the gateway's existence, but the formalities of the
situation have yet to be finalized.

Disclaimer: I speak for myself, not CompuServe.

Questions about the gateway => karl@cis.ohio-state.edu
Questions about CompuServe => postmaster@compuserve.com

--Karl Kleinpaste
Personification of the Mailer Daemon
Ohio State Computer Science
Instigator of the Internet/CompuServe mail gateway
no longer acting "postmaster@compuserve.com"

The Internet<->MCI Mail Gateway is an experimental mail system being
developed by the Corporation for National Research Initiatives (NRI),
a non-profit research organization. NRI is currently researching
interconnecting various mail services.

Currently, there is no charge for sending mail from the Internet to MCI Mail.
In order to send mail to users on MCI Mail, use one of the following
addresses:

accountname@mcimail.com
-or-
mci_id@mcimail.com
-or-
full_user_name@mcimail.com

For instance, I have a mailbox on MCI Mail. You could send mail to me
via either dely@mcimail.com or 379-3286@mcimail.com or David_Ely@mcimail.com.

Users on MCI Mail can also send messages to the Internet. At the "Command:"
prompt, type "create <carriage return>. Then the user performs the following:
(NOTE the "TO:", "EMS:" and "MBX:" strings are prompts provided by MCI Mail.

Command: create <return>
TO: David K. Ely (EMS)
EMS: INTERNET
MBX: dely@NRI.Reston.VA.US

This address is translated to:
"David K. Ely" <dely@NRI.Reston.VA.US> by the Gateway.

Mail sent from MCI Mail to the Internet is charged by MCI Mail.

One final note: Feel free to use the gateway as often as you'd like, but
be forewarned: The gateway is still not considered fully
operational; sometimes mail will be delayed (usually less
than 24 hours.)

If you have any more questions, or if I can be of further assistance, please
feel free to email me.

3934. Current Notes Magazine

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 02:30:43 UTC
From: matthews@umd5.umd.edu
Message-ID: <5758@umd5.umd.edu>
Source record: 245907

[pre-note: I am not the author of the following message; I'm just passing it on... I'm also not sure how to post an original message on the net, so I'm just posting a follow-up with a new subject. -Mike Matthews]

Note to Internet Users: This information is derived from that posted on the General Electric Information Exchange (GENie) Atari ST Roundtable. For further information contact the magazine at the address given below. Category 15 of the GENie ST Roundtable is devoted to things by and about Current Notes.

Current Notes Magazine
Your Monitor on the World of Atari

In 1981 several Atari User groups in the Washington DC Metropolitan area banded together to produce a joint newsletter in the hope of realizing economies of scale in postage and production. Software reviews and other news of the Atari community soon became such an attractive feature of the magazine that it outgrew this original purpose. Readers all over the nation asked for copies and Atari dealers began to stock it in their stores.
Today over 60 user groups in 29 states and Canada offer Current Notes to their members at special subscription rates and approximately 120 retail outlets from Alaska to Florida offer it to their Atari customers.
The feature of the magazine that has made it so widely accepted is its orientation toward the consumer. Current Notes has a reputation for telling it like it is in software reviews. CN's reporters ferret out solid news to help Atari computer users understand events at home and around the world. Current Notes' regular stable of columnists like Dave Small and Andrzej Wrotniak bring readers the human side as well as the technical side of Atari computing. There are also special features for beginning users.
Current Notes' disk library is one of the most comprehensive sources available for basic and advanced software titles. Special effort is put into making these programs usable by everyone.
For the Current Notes contributor the magazine is a labor of love. It is our way of sharing the joy and the agony of Atari computing with everyone.
GENie and Current Notes have now joined together to provide this Category in the ST Roundtable as a forum for letting others in the community contribute to our work. Letters to the editor are especially welcome. Give us your thoughts for issues that need to be addressed. Use GEMail to submit articles that you think might be worth publishing. Ask us questions.

If you like what you see here and you want to see more of it you can become a subscriber. Check this message thread for the latest subscription information.
Current Notes has always provided special support for user groups, particularly by providing discount subscription rates. Check with your user group to see if a discount is available for you. User group leaders whose clubs are not already registered with Current Notes may wish to explore this option.
All correspondence regarding individual subscriptions, dealerships, or club registrations can be sent to our GEMail address, "JOE.WATERS" or through the US Postal Service to

Current Notes Magazine
122 N. Johnson Rd
Sterling, VA 22170. 703-450-4761

Upcoming features in our message threads and libraries will include lists of registered clubs, cumulative annual indexes, lists of Atari dealers, and other special publications. Look for announcements.
Current Notes Subscription Rates
as of 12 December 1989
1 yr 2 yr

WAACE Club Member - Check with your club treasurer
CN Registered Club Member $20 $38
Individual Subscriber $24 $42
Canada, 2nd Class Post. add $8 per year to above
Foreign Surface Mail $39
Air Mail
Canada/Mexico $42
Cent Am, Carib. $51
S. Am, N. Africa, Europe $61
Mid East, Africa, Australia $71

All orders prepaid, foreign orders by bank draft in $US payable on US bank.

Current Notes Registered Clubs

Atari User groups can become CN registered clubs by submitting subscription requests for six members or 10 percent of their membership whichever is less. Additional members subscribing can do so at the discounted rate given above.

Submitting articles for Publication
in Current Notes Magazine.

Current Notes Magazine is published using Word Perfect text imported into Timeworks' Publisher ST. We use preselected style sheets for a uniform appearance throughout the magazine. Artwork can be accepted as .NEO, P??, IMG, or GEM files. If you wish to submit something that you have laid out yourself you must also submit the individual components.

ARC your .WP files, the .DTP file, and any auxiliary files together into one module and use the XMODEM send option in GEMail to transmit the material. (InterNet users may be able to make other arrangements).
Any decision regarding acceptance or rejection of such unsolicited material rests solely with the editors and publisher of the magazine. You will be notified when we receive your material and again when we make a final decision on acceptance or rejection.
Note that no author in Current Notes receives payment for material that is published.
There are occasional publication delays due to a backlog of material or because there are unresolved technical issues.

3935. Re: STE vs ST Shifter

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 03:29:41 UTC
From: jwt@atari.UUCP
Message-ID: <1873@atari.UUCP>
Source record: 245908

neil@cs.hw.ac.uk (Neil Forsyth) writes:
>I'm not bothered about SHIFTER, it's MMU I want replaced. No palette changes
>just better hardware scrolling.

The scrolling features required revisions to both the MCU (since if you
are not word-aligned you need to send (at least) one more set of words
to the shifter per line) and the Shifter (so it could decide which pixel
of the word to start on).

Neither the STe shifter nor the new combined MCU/Glue can be directly
plugged into an ST.

Jim Tittsler, Systems Engineer (and alleged hardware type), Atari Corp.

3936. How to quiet a 1040ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 05:32:33 UTC
From: hugh@dgp.toronto.edu
Message-ID: <1989Dec9.003233.28485@jarvis.csri.toronto.edu>
Source record: 245909

Recently 880139h [is that a first or last name?] at aucs asked what he could do about his noisy 1040ST. I sent him this, but he apparently doesn't know that netiquette requires him to post a summary.

Anyway, I got the following from Atari Canada's BBS a few years ago. It worked for me. Note: these are not guaranteed by Atari or by me.

Hugh Redelmeier
{utcsri, yunexus, utzoo, hcr}!redvax!hugh
When all else fails: hugh@csri.toronto.edu
+1 416 482-8253

Does your 1040 whine? When you boot up do you get the mosquito repellent? If so, this is for you. It is the "official" Atari 1040 power supply fix for 1040's that have a high pitched whine emitting from them. The problem is the switching power supply that is used for the RS-232 port. It is supposed to switch at around 18 Khz, but due to parts tolerances, it sometimes falls lower than that, the result being a irritating "whine". It has falsely been decribed as "drive whine", and defective power supply modules. The circuitry is actually on the motherboard. This mod also cures a video "flutter" that sometimes occurs. Faint horizontal bars float up and down the screen. If you are not faint of heart, here are the instructions for the modification.

Note: I _do not_ recommend this if you are not familiar with electronics!

You will be playing with the power supply, and if done incorrectly, could fry your ST! I am providing this info so that the folks that are out of warranty can do it themselves. Also some dealers may not be familiar with the problem (well, Dave Groves was also twisting my arm!).

I do not accept reponsibility for any permanent mushroom clouds that you may cause, though I will be happy to help out if things go wrong (advice!).

Ok, here goes:

Take the case off of your 1040. Remove the power supply module. It's pretty straightforward, as there is a plug for the wires. Untwist the grounding tabs on the shield and lift the shield off of the PC board.

The parts to change are on the motherboard, below where the power supply was, and to the right of the ROMS. Change:

Part no. From To
R17 1 ohm 5 ohms
L4 100 uh 220 uh
C28 100 pf 330 pf

Now, looking at the 1040 from the front, here is where the stuff is:

R17 is one ohm (brown - black - black), and is below C26 (yes, that _is_ a capacitor!). L4 is the resistor looking thingy to the right of the I.C., a TL497. It's color code is brown - black - brown. C28 is located to the left of the I.C., next to a larger black capacitor. It's color code is also brown - black - brown. While these locations should be accurate, please note that they could, and may change at any time! It is very important that you replace the correct components.
You will need a good soldering iron, and solder of course. A desoldering bulb, pump or solder wick is also needed.

Parts should be +/- 5 % . Be sure and check the voltage at JP2 and JP3 (red and blue wires) for +/- 12 volts, +/- 15%. If not, it's time for the service center!

The only part that is usually hard to find is the inductor L4. It is available from Newark Electronics (they have branches all over the place!). The part no. is 35F1885 and is called a Deci-Ductor. They cost around $4.00.

Well, that's about it. Hopefully after this point you will power up to blissful silence (and saved some $$$ to boot!). Good luck!

> What ad campaign? The only ads I know about are the Portfolio ads in
> magazines and newspapers and the great Lynx ads in the New York area. I
> know a few dealers are taking advantage of Atari's co-op advertising,
> but I've only heard about them in Texas and, I think, North Carolina.

(sigh)
You know, it's always something. I am amazed at all the negative trash people still post about Atari and the marketing in the US. I mean, haven't we had our fill?? Moan moan moan, bitch bitch bitch.

We hear about how well Atari has done in Europe, and I feel that that is keeping Atari viable at this time (not to mention that the stock price is alright...)

Atari just doesn't have the resources to do an Apple type campaign- what do you want??! They decide to concentrate some advertising in certain markets, and in some areas, are selling out of STs and Megas, and now I see someone bitch that they haven't seen it??

SO WHAT! Perhaps you live in a smaller market, where it wouldn't be as cost effective as New York, about the largest market area in the US.

You have to consider that Atari is not the half billion dollar company anymore, and is reasonably successful. Anyone in the US can tell you it is not about to displace IBM, or even Apple in the real world (of business). Atari just can't spend millions in smaller markets, so wake up people.

Constructive critisisms, fine. The same old moan and bitch story, knock it off.

If you guys are so negative, and vindictive about Atari, why even waste time on this group? I suppose there are some nerds that get off on this kind of thing, but I thought that the users here have some kind of life.

3938. Saving the menu bar

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 12:53:18 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Dec9.080019est.57438@ugw.utcs.utoronto.ca>
Source record: 245911

In response to the question about saving the menu bar:

The menubar disappears when you execute a TOS program from a GEM program
and then return (using the VDI escape functions to get a TOS screen).
There are a couple of ways to save the menu bar. First, if your application
is actually an application (ie. it owns the menu bar), just use menu_bar()
to hide the menu before you run a program, and use it to redisplay the
menu afterwards. If it is an accessory (be careful here!), call wind_get()
with window handle 0 (DESK) to get the working area of the desktop, and
you should be able to presume that everything from 0 to X with width Y
is the menu bar (use the VDI raster functions to save it!). Good luck.

David Megginson, Centre for Medieval Studies, Toronto

3939. Hey, you she/he!

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 13:11:38 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Dec9.082033est.57440@ugw.utcs.utoronto.ca>
Source record: 245912

OK. Let's see if I can end the debate. A few hundred years ago, people in English started using 'ye/you' (//French vous), which is plural, to address a single person politely. Now we barely ever use 'thou/thee' (//French tu/te) except in special religious contexts, and we use the plural 'you' (we have lost 'ye') for everyone. For my children or grandchildren, 'they/them' for a single person will be normal, as in "Every user should check their computer."
That sounds terrible to me, but in 50 years I'll be dead anyway, and none of the people using it will care. He/she and s/he are just temporary crutches for people like me who don't like a singular 'they', but the English language has changed and will change, like it or not.

David Megginson, Centre for Medieval Studies, Toronto

3940. TOS 1.4 Incompatibilities

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 13:34:55 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Dec9.084059est.57396@ugw.utcs.utoronto.ca>
Source record: 245913

Please stop posting arbitrary incompatibility lists for TOS 1.4. Most of the problems posted come from using a disk-based version of the TOS. First, the disk-based version is a BETA version, with many bugs still in it; second, the disk-based version takes up RAM and changes the location where some poorly-written, non-portable games expect to find things in your computer; finally, the disk-based version takes up about 200k, so your big GDOS program (like DTP) may not be able to run correctly.

Even if you have the chip set for TOS 1.4, take everything off your computer (QuickST, accessories, other auto programs, _everything_!), do a _cold_ boot, and then try it again. There has been way too much mis-information floating around about TOS 1.4.

David Megginson, Centre for Medieval Studies, Toronto

3941. TeX and Calamus

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 13:52:55 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Dec9.085925est.57401@ugw.utcs.utoronto.ca>
Source record: 245914

TeX is not the only package which can typeset mathematics, nor is it the only package which can print out long documents without stopping. It is very simple in Calamus to set mathematical formulas, since you can use the arrow keys to move individual characters around on the display (when PKS Write comes out, you will find it even easier). Calamus can also print out about 100 pages (or more, depending on the complexity of the graphics) on an SLM804 in under half an hour. You can include various combinations of text, alignment, attributes _and_ kerning in Calamus macros, so mathematic formulas would take only seconds!

All said, it is still smarter to distribute in TeX because 1) TeX is free and 2) TeX exists on different machines.

3942. cartridge port

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 16:49:56 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4840@blake.acs.washington.edu>
Source record: 245915

Considering all the discussion about cartidges lately,
I was wondering what the prospects are for building
an inexpensive multi-port extension that would allow
those who need the port for more than one application
to not have to turn the machine off.. reinstall "another"
cartridge or dongle etc.. Doing this on a regular basis
will only ask for problems.. guarranteed damage to the
port and to the cartridge or dongle.

Specifically, I would like to get the GCR.. I also use
NOTATOR on a very regular basis. There are other
commercial products requiring the use of the cartridge port,
obviously... I assume building a cartridge extender is
difficult and costly.. otherwise there would be one on the
market... C-LAB puts out "The Combiner" for $349.00.
Seems a bit pricey to me!

Does anyone know of another in development.. or already available
that is reasonably priced?

3943. NOTATOR

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 17:02:46 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4841@blake.acs.washington.edu>
Source record: 245916

NOTATOR currently does NOT work with
either the moniterm nor with Jim ALlen's
accelerator.

The Moniterm support will take about two weeks of
software work (according to the US national rep)..

TO work with the Turbo16 accelerator or with the TT,
a change in the timing of the read of the dongle has
to be implemented... another software change.

Regarding the accelerator: I am told that there
is a German board that does work with NOTATOR.. however,
the cache has to be disabled.. and as a result, there are
no real noticeable improvements in scrolling ..

However, as the update to NOTATOR will include a full page
preview among other things.. it would be nice to have
MONITERM support. As it is now, one needs to do a lot
of verticle scrolling when viewing and editing more than
6 tracks. This gets very time consuming.

POINT: THe US rep Mikhail Graham tells me that C-LAB won't
support the MONITERM unless they get a few hundred calls
requesting it. SO far there has been few. So, if any of you
NOTATOR users are simply waiting for MONITERM support.. it won't
be there unless we call in our request.

Here's the name and number of the C-LAB rep. A very nice guy
i might add:

Mikhail Graham
1-916-265-6484

He's always receptive to ideas and encourages users to make
suggestions for improving the already awesome NOTATOR.

Source record: 245918

Regarding the good spelling checker in Word Writer and lacking in First Word Plus: I don't know if it's still available, but Thunder from Batteries Included is THE BEST spelling checker I've seen on any computer. And I've seen a few, since I was involved in evaluating packages for use with Stedman's Medical Dictionary for Stedman's owners. It didn't use that much memory, and it was fantastic at finding the correct spelling of misspelled words. It ran in the background so it could check spelling while you type, and it would work with just about any GEM program (eg NOT ST Writer).

I think BI is out of business, however, and I don't know if ayone is still marketing it. You may be able to find an old copy left over. If it's not being produced anymore that's a shame.

Hello all,

From Panarthea, I just downloaded the converted Macintosh fonts
that are in the encoded file. Inside the file were a nice selection of
fonts with an accompanying ASSIGN.SYS.
I substituted my ASSIGN.SYS with the file's ASSIGN.SYS, ran the
WIDTH.APP program and received an "Error Loading Driver File" message
or something to that effect.
Instead of trying to fight this thing, I'd like to ask others
on the net, "What are the ground rules for using a different
ASSIGN.SYS?" Obviously, the generous contributor included the
appropriate ASSIGN.SYS with these fonts as an aid to keep us from
having to edit our former ASSIGN.SYS. Help? Comments, anyone?

3947. Hard drive kits. Which one?

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 19:10:56 UTC
From: Cassius_Gaius_Longinus@CC.SFU.CA
Message-ID: <1963352@cc.sfu.ca>
Source record: 245920

Hi. How that I know I can send to the list, and hope that it makes
it to the usenet as well, I have a couple questions.

First, I have managed to put together enough $$ for a hard drive.
What I would like to know is, which of the kits is better, the ICD,
the Supra, or the BMS one. I realize thatit is somewhat difficult
to say if you only had one of them, but what is the general feeling
on the net. Also, what about drives. I think I want a seagate "ST296N",
but the "ST277R" also looks good.OY(K which one do you people think
it would be better - appart from the 20 meg extra storage of the 296,
which I might not really need, but it's nice to have. Also, if the
277 is the choice, do I get the "XT" or the "AT" kit, or just the
bare drive?

Second, after having received all the parts (all 21 of them) for the
GNUemacs from the Panathrea server, I found out that the 'emacs' file
was corrupted. All other 'unzooed' ok, and even the emacs one did,
but gave me a warning, and wouln't load. So, would a kind sould mail
but gave me a warning, and wouln't load. So, would a kind soul mail
me the 'emacs' file. Also, is there a better editor that I should
perhaps look at?

Thanks, and sorry to have gone on for so long but this IS my first
'real' post.

>>Scott Le Grand aka SML108@PSUVM.PSU.EDU
>
>Mark Davidson <aimd@ed.castle>

I have also had difficulties with Kermit in Uniterm (v2.0b). Downloading
works fine, even in binary mode, but uploading does not work fine if there
is a communication server present (e.g. something that forces kermit to
use 8th bit prefixing, or whatever that's called). I know this is a bug
in Uniterm's implementation of kermit because another kermit I have for the
ST will do those same uploads correctly. From the discussion here, it does
not sound as if this bug has been fixed in later versions.

--Patrick Simon mpsimon@phoenix.princeton.edu

p.s. I had even more difficulties with transfer until I set the Unix end
kermit's parity correctly. This can be done in the kermit initialization
file, so you don't need to check it each time.

p.p.s. I use uniterm all the time, and really appreciate the effort Simon Poole
has put into this program.

3952. Re: Spectre Sound

Newsgroup: comp.sys.atari.st
Date: 1989-12-09 22:18:14 UTC
From: dsmall@well.UUCP
Message-ID: <14881@well.UUCP>
Source record: 245926

The base note asks if Spectre GCR can handle Mac sound. (I'll condense it for space reasons).

Yes, it can. If selected, the Spectre software will produce sound using the same 370-byte digitized sound buffer the Mac uses. So it bleeps, blonks, and whatnot. SoundMaster works, so you can tie various MacSounds to Mac events (keyclick, beep, disk eject, etc.) Talking Moose works, if you're into that. I'm embarrassed to report that even MacPlaymate sound works (it's not that good, really!).

Only exception: the latest Systems (6.0.2/3/4) did sound a different way, and we have some bug that prevents them from thinking they're running on a Mac Plus. It's in the process of being fixed. Sys 3.2 and such work just fine. The "Sound" CDEV will only appear in Mac Plus mode, by the way (ALT +; see manual).

Source record: 245929

Hmmm .. shareware Aladin, eh?

I'm also surprised to hear that I've been quoted as saying anything negative about Aladin. The only thing I recall was a comparison between it and Spectre 128, and that is an apples-and-oranges comparison (no pun meant). I use the 128K ROMs, and get the benefits of that; Aladin uses the 64's, and gets the bugs in those. For those that don't know, the reason Spectre runs all the Mac programs that Aladin can't has nothing to do with our relative programming skill, etc; it's just the 64K ROMs are obsolete and much software doesn't run on them.

I'll say it again -- while the makers of Aladin and I had different ideas about how things should be done, I feel the Aladin was implemented quite well according to their vision. I don't happen to agree with the vision, but I can agree with the competence, ok?

Since both the MagicSac 6.1 and Aladin 3.0 use 64K ROMs, it is at least fair to compare them. Both have strong and weak points. The Aladin does a superior job with serial ports (SERD) by far! The Magic Sac doesn't require a patcher program to "fix up" Mac programs before running them. And so forth and so on ... by the time you end up comparing strong and weak points, I think they come out equal -overall-, more or less.

The Magic Sac at one time sold for $149. The price declined to $79, then to $49, in ads in START magazine. I am repeatedly told that the unitit now offered at $40, $20, or free with purchase of Translator. Essentially, that's the U.S. market for a 64K ROM based Mac emulator. And it's my opinion that the Aladin-shareware will meet much the same response, alas.

It's too easy to slip into the "features trap", when in reality both Magic Sac and Aladin are "icing" on the ROM "cake". The truth is, using 64K ROMs automatically breaks a large amount of Mac software. Even Apple doesn't support them anymore; they gave up fixing bugs on bugs. Very quickly, Hypercard, Quark X-Press, MacWrite 5 & II, MacPaint 2, MultiFinder, Systems & Finders past Finder 5.3 / System 3.2 (obsolete in anyone's book; we're at Finder 6.1 / System 6.0.4 now), CDEV's, Adobe Illustrator, Aldus Freehand ... well, I could fill up a few pages with this, but I think I've made my point. Apple and its developers have abandoned the 1983 64K ROMs, and with good reason.

These programs are what make a Mac into a useful tool that people are wiling to spend money for. To me, it is irrelevant that Aladin does a nicer job on the serial port, or RESET button, or whatever, if it won't run the software I want to run. The icing on the cake doesn't matter, be it Magic Sac, Aladin, or chocolate.

At the moment, I feel the state of the art in Mac emulation, on both Amiga and ST, is a 128K ROM emulator that is capable of directly read/writing Mac disks. Things have progressed a long way since the original 64K ROM emulators debuted in 1986.

I do hope that if this product is made availabl as shareware, that people do not expect it to do what Spectre / AMAX can -- and thus end up turned off to the newer products.

As for Apple, I've always been square with them, and they've treated me with the same courtesy. There's nothing to tell there that hasn't been told sixty times -- we agreed not to name the product MacCartridge and not to sell Mac ROMs. (Now, if you want to look at something *interesting*, delve into the court documents surrounding the origins on the Microsoft-Apple look&feel lawsuit; Data Pacific's name is all over them. I think they are online on BIX; at least, I was sent them from there.)

If I may ask -- can the story of the development of Aladin be told? I remember the name Mathias Greve, and something about two brothers who did the original product; I'm not familiar with the shareware offerer's name. I'd like to hear it if you'd care to tell it.

Again, if you'll check through several interviews and articles, you'll find I have said good things about Aladin -- and that I've maintained that comparing 64K ROMs to 128K ROMs is unfair. And I thought doing sound through the parallel port was really a neat idea; the overhead of doing it through the sound chip was pretty hairy.

Anyway, I guess that's my comment on the "shareware Mac". Please, be very careful, for your own sakes, that Apple is aware that you're not putting ROMs on disk and don't allow EPROMS. And be very very careful of "derivative work" issues surrounding patching software to run on the Aladin, ok? There's some real minefields there to be cautious of.

If any of the makers of Aladin ever make it to Denver, please give me a call, okay? Let's go get a beer.

From: dsmall@well.UUCP
Message-ID: <14885@well.UUCP>
Source record: 245930

I'm writing this on a Stacy - 4 (4 mb RAM / 40 meg hard disk) in Mac mode, using a Spectre GCR.

Good News! FCC has approved Stacy, Atari announced Wednesday night online. While I am under nondisclosure and must limit what I say, I think it's safe to say that Atari has really pushed hard to get Stacy out the door and in a good, usable form. Atari has also done things to help us here at Gadgets ensure that all is well with the GCR on Stacy, up to & including the Tramiels.

THIS IS NOT AN OFFICIAL PRICE, AND DON'T SAY I SAID SO, but I was told the pricing on a 4/40 unit, like this one, might be $2500. You can do the math yourself to figure how many Stacys you can buy for one Mac portable.

I also have to say that as cynical as I am, after years of Atari-watching, that there have been good things happening there that I wouldn't have dreamed of happening even six months ago. Yes, there are problems and weak points. However, there are good things happening as well, which to me show signs of maturity and acknowledgement that US software developers are essential to Atari's future. We could be witnessing the end of Atari's troubled adolescence.

On the Stacy: I find the screen very nice to work with. The much overhyped "mouse movement" stuff is no big deal; it just takes getting used to, just like getting used to a mouse in the first place. The Conner hard disk is very fast indeed, and the machine seems 100% compatible with everything.
Obviously, this is a musician's dream for MIDI applications.

I found it *highly* entertaining that Apple put up very bright tracklights above their Mac Portable display at Comdex. Anyone who's tried it in normal to dim light knows why. Atari made the right move offering backlighting; as a Toshiba 1200 HB owner, I'm hooked.

Apple went for a meg of static RAM(!) (!!!!!!!), whereas Atari uses the more power-hungry dynamic RAMs, which cost a heck of a lot less. The down side, of course, is reduced battery life. After testing, I do not recommend batteries for a 4 meg / hard disk unit *at all*; those d-rams pull some kinda amps. (Maybe a Gates lead-acid battery would be up to it?) I'd expect the 1-meg floppy units to do pretty well. But look, I almost always use this thing where AC is available, just like one of the higher powered Toshiba units; the advantage is portability. No monitor to lug, no drives to lug, cables, etc. If you want a battery-portable, go 1 meg /floppy; if you want what I've got, go 4 meg/hard disk. The price is *really* right.

Atari has also announced that developers get a 50% discount.

This is beginning to look like one of the great deals in computerdom.
I expect that *very shortly* we'll get the T-16 accelerator on this, so
we can get around true 12 mhz throughput; we'll get pc-Ditto or PC-Speed;
and then we have a killer laptop.

Good job, Atari. Keep it up!

-- thanks, Dave / Gadgets

p.s. I want to publicly deny the rumour that Ken Badertscher is planning on
asking out Cindy Claveran (now back with Atari for a bit (!!)). (hi ken!)

3957. Re: Prodigy run under Spectre GCR?

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 00:15:13 UTC
From: dsmall@well.UUCP
Message-ID: <14886@well.UUCP>
Source record: 245931

The base question asks if Mac Prodigy online software runs on Spectre.
[I hope no one minds me quickly summarizing the question like this,
rather than quoting 15 lines with indenting. If I'm breaking a custom,
let me know, okay? I'm no USENET whiz].

Right now, at this second, at present, not in the future,
Prodigy doesn't work on the Spectre. The reason is that it is closely tied
to the Mac hardware architecture, and breaks numerous Mac programming rules.
For instance, it "lives" at IPL=7 (the eyebrows of everyone at Atari just
went up) and thus ignores keyboard interrupts. We've spent quite some time
chasing it with the Zax incircuit emulator, since nothing else can
penetrate it.

That's the bad news. The good news is that it DOES work on the AMAX
if you hack a memory location. If memory serves, you need to change _SCSIflag
to $80. (Memory may not serve -- I would call ReadySoft). This means it
has to be very close to working on Spectre.

So please don't take this to mean it will never work. For all I know,
it may come up tomorrow. In fact, I think it's time for me to give Simon
Douglas at AMAX a call, and see if he can tell me what's wrong....

We will announce it when it starts working.

-- thanks, Dave / Gadgets by Small

p.s. I've wondered if the numerous replies I write are getting obnoxious to
other Net users, many of which could care less about Mac emulation. Those
I can answer by mail, I do, but many are of public interest and need
posting here. Would you prefer if I "batched them up" and answered several
questions at once? Of course, that would break the subject thread that "rn"
uses ... any other solutions / suggestions / comments are more than welcome!

Send to the above address ...

3958. Re: A LEGAL Mac emulator!

The note-thread discusses the legality of purchasing Mac ROMS, System, and Finder.

I have no comment. See next paragraph.

People, please, please be careful about giving legal judgements as anything but your own personal opinion ("..in my personal opinion .."). Even that may not be enough. I was told in no uncertain terms that only attorneys can render legal opinions, and if someone gets upset about what you write, they can use it against you.

I am not giving you this advice to advocate restraint of free speech, which I very much favor, nor to mindlessly irritate you. As many people know, Gadgets is currently involved in a "replevin" action against Data Pacific, and a "libel" action against Happy Computers, plus their respective presidents. Many of the comments I have made online are included as exhibits in those suits and are the actual subjects of those suits. (Curious? Look at the GEnie conference, May '88, in which I discussed whether or not to do the 128K Mac emulator.) I am just giving you this advice from some rather bad personal experience; while expressing your opinion online, *be careful*. I would recommend spending the bucks to get a legal opinion from a computer literate attorney (they're broken out by category in the yellow pages) on how you should word your comments.

I have no comment on ROM procurement / System-Finder procurement.
It is my personal opinion that I made very sure, to the tune of large lawyer fees, that the ROMs could be had -- call up Pre-Owned Electronics and see. Still, if you see a license and are bound by it, I think you should stick to it.

Personally, the thought of someone telling me what I may or may not do with chips I paid big dollars for is ... you can imagine. I can just see Radio Shack:"What is your intended use for this 74LS04? An assault weapon?".

Please be careful. While it is one of the first cases, you can *bet* that more libel actions will be brought by manufacturers whose products are criticized online, as manufacturers realize the power of the medium. USENET may be the biggest of them all.

Suggestions for what toputin a witty address line are welcome. I'm senile.

3959. Re: Blitz copy cable and utility

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 01:22:19 UTC
From: dsmall@well.UUCP
Message-ID: <14889@well.UUCP>
Source record: 245933

The basenote contains info about the BLITZ disk copier cable.

This is essentially an analog copier. The "read-data" wire coming from drive "A" is connected directly to the "write-data" wire coming from drive B -- hence, whatever magnetic flux shows up on the track gets plopped onto the destination drive. This makes for a powerful copier indeed.

I used to *sell* a copier extremely like this, called the L.E. Systems FDC system, back in '82 or so, for the Atari 8-bit. With 8 drives (1 master, 7 slaves) it would produce 7 exact copies of a very copy protected disk in around 17 seconds. I will attest that thousands of 8-bit disks from Synapse, Broderbund, Origin Systems, Paradise Software, Epyx, and others I can't recall 7 years later were produced on this system, and were very reliable. It finally went away during the big slump of the 8 bits.

Now, I'm supposed to be anti-pirate, right? Why do I like this system? Bit-shift. See, when you write disks, if I've had it explained to me correctly, you're writing a bunch of small bar magnets on the disk. If the bits are north south south north, those two bits repel each other, and physically move away. Similarly, north south north south attract, and move closer. This makes them move away from the "window" that the data seperator uses to determine if a bit is there or not.

As I understand it, "write precompensation" is the science of moving repelling bits closer together at write-time so they end up, after repelling, where they should be, and more or less the same for attracting bits.

Now, when you analog copy, the bits start drifting, since there is no write precomp. My personal experience with both single and double density disks (heh! and even Commodore 64) is that you have no problems on first generation clones. Second generation, the innermost tracks, where things are the hairiest, start to glitch, and third generation is hopeless.

Hence, this is a backup device that works best when you put a master disk in the "from" drive. It doesn't work at all well when copying a copy, in my experience. That tends to step on the copy-of-copy-of-copy piracy. (Sure, it doesn't affect BBS's, but that's another issue).

The other nice thing about BLITZ is its simplicity. I have looked over the docs and it looks like 20 minutes with a soldering iron, nothing hard. Parts are a DB-25 connector from Radio Shack and a disk cable from your local Atari dealer (or Best Electronics). There does not seem to be a copyright on the supplied software.

Thus, your major cost is the download. Even ST-World is offering the documentation on its monthly shareware disk.

BLITZ copied, with no problems, literally every copy protected
disk I own. I know people who use it for a formatter! (I don't recommend
that, as it's a second-generation copy w/o verify). It is extremely fast.

Technically, the big problem is syncing up index pulses. On both
drives, they have to occur at the same time. If you just copy, you'll likely
have a sector end up straddling the index pulse, and the 1772 automatically
generates a CRC error if it sees an IP in the sector (bug in the chip, WD
says). Thus the BLITZ has to get the drives spinning together, which is
a matter of toggling the MOTORON line on and off at high speed to slow one
drive until they sync. Doubtlessly the DB-25 printer port is used to supply
both the index inputs and output motoron, drive select, step, and so on.

It is also probably helpful if drive B runs slightly more slowly than
A:, so A:'s track "finishes" at index pulse before drive B, just a little.
That was the case for the L.E. copier.

I understand an outfit in Las Vegas is already advertising and selling
BLITZ cables and software, pre-made, ready to run. I know several people in
Denver who have built them and they work, plus those on GEnie.

Now, if we could just make pirate BBS copies of programs degenerate
each time they're copied ... <wistful sigh>.

I hope this information about BLITZ is of interest.

-- thanks, Dave / Gadgets

3960. BBS Announcement

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 01:29:39 UTC
From: ROEDERT@ARIZVM1.BITNET
Message-ID: <8912100807.AA01043@ucbvax.Berkeley.EDU>
Source record: 245934

Having finally received an update to the BBS program that I wish to use, I am once again going to bring up my ST Binaries BBS.

For those who don't recall my posting a couple of months ago, this BBS will carry the programs from the comp.binaries.atari.st group. The purpose of this is to make the contents of the binaries available to those who do not have access to the Net. As such, please pass this announcement on to any local ST BBS's so that the existence of this service can be widely advertised.

The BBS will operate from 10PM to 6AM, Mountain Standard Time, 7 Days a week. The number for the BBS is:

602-578-9115

The first day of operation will be Monday, 11 December 1989.

Currently, files from Volumes 1-5 are available. The other volumes will be added until it is as up to date as possible.

Thank you for your time.

Timothy Roeder - SYSOP

Internet: troeder@mis.arizona.edu
Bitnet: roedert@arizvm1.bitnet

Deskcart! from QMI has a clock on board. In addition, it is a package
of desk accessories that do all sortsa nifty things. It does, however
require some 80K bytes of RAM for everything to be "nominal". ie: it
has a resident spooler/ramdisk that requires ram, if you use them.
Included are a calculator acc, a card file, address book, disk utils,
ramdisk,spooler,notepad,macro keys (including the ability to launch
the DA's by hot keys),typewriter,vt52 emulator,appointment scheduler
w/ alarms, control panel, Degas (tm) compatible printer driver auto loader
and a few other tidbits. It is really one of the better kept secrets
for the ST (I should know, I helped code it). And did not get rich doing so.
It has been deemed by certain magazine reviews in Start & computer shopper
and a few others as the best add-on product for the ST... <blush>

WILL HP LASERJET IIp WORK UNDER SPECTRE?

A posting by Richard Corvet (did I get that right?) about the Panasonic Laser printer Kx-P 4450 mentions that printer will work under the Spctre

But I am told the Panasonic is much more expensive than the <$1000 Laserjet IIp.....so I am getting a IIp....if it works with the ST 1040. Does it?

I guess I will have to buy Wordperfect for /processing with the IIp but how will I get graphic output for other programs like Music Studio 88 or Dr. T's KCS v1.5?

Are 3rd party drivers available to enable use of such programs with the Laserjet IIp?

Your input appreciated.....

Thanks

Imran Anwar

>>
>> Thank You,
>> Gregory Gibson

Because of this very reason, I wrote a C program to analyze regular text files and determine where the paragraphs end and then convert the text file into a Word Writer (also First Word) file. I can send it to anyone who wants it. It is just a short C program (written in Laser C, but ports to UNIX, so should be able to port to any C language for the ST).

I don't have my code available now (just reformated the hard drive for MINIX, and the Laser C code is backed up on floppy) but from memory, I think that all blank spaces (ASCII 32) gets converted to ASCII character 30. There is a ASCII character 30 before every newline (ASCII 10). And the end of a paragraph has no ASCII 30 before the newline.

Kind of an interesting format. When the Word Writer format is displayed all the blank spaces will appear to have disappeared, but really, they are just represented as ASCII character 30, which doesn't show up on the Atari ST screen (at least it doesn't in TOS/GEM).

Sorry Ken, but I can't accept this. Mostly, I've avoided getting
involved with the flame wars against Atari, since a lot of the comments
have been overly negative if not inaccurate. Also, I really appreciate
your taking the time to participate in the net, and the other Atari
employees as well. But this last comment of yours makes no sense when
you consider that developers must sign a non-disclosure agreement that
prevents developers from legally releasing a good deal of important
information contained in the developers' kit. It seems as if Atari is
intentionally trying to restrict the flow of information, although I
could hardly guess why. Before I can believe that Atari intends for
developers to take its role in educating the hobbyist, it will have to
change this unexplicable policy.

>
>Last question: is HiSoft V5 an upgrade to lattice, or just a replacement? The
>difference is obvious to those who have extensive private code libraries.
>

I got a newsletter from HiSoft in October. This is what it said about
Lattice C:

-- START --

HiSoft & Lattice get together!

HiSoft is delighted to announce the forthcoming release of the Lattice C
compiler on the Atari ST.

Lattice C 5 is currently only available on the Amiga, where is has received
high praise - its code generation is one of the fastest and most compact yet
seen on microcomputers.

Now, HiSoft and Lattice are porting the package to the Atari ST and taking the
opportunity to add extra features to produce a product that will bring the very
latest C compiler technology to the Atari ST, generating the best code ever
seen from any Atari C compiler.

The version 5 compiler has many improvements over Lattice 3, including:

+ Powerful compiler generating native code, with complete ANSI conformance.

+ High performance global optimiser for removing redundant code from your
programs.

+ Standard assembler for including assembly language in compiled code.

+ Fast linker with many features including automatic branch extension (for
out of range branches).

+ Librarian for examining and constructing libraries quickly and easily.

+ Disassembler so you can check the code the compiler has generated and hand optimise if needed.

+ Complete time sliced profiler for locating the `hot-spots' in your code.

+ Fully integrated HiSoft environment, with complete configurability.

+ Lattice 3, Lattice 5, ANSI, UN*X, AES, VDI, BIOS, XBIOS, GEMDOS and Line A libraries, the most complete libraries ever.

Lattice C 5 on the Atari ST will be released in November 1989 at an introductorary price of 99.95 (pounds sterling) inclusive. We expect a high demand for this product and will process orders strictly by date received - place your orders now.

--END --

I don't know about HiSoft in other countries, but in the UK, their address is:

HiSoft,
The Old School,
Greenfield,
Bedford,
MK45 5DE,
UK.

From UK:
Tel: (0525) 718181
Fax: (0525) 713716

From elsewhere:
Tel: +44 525 718181
Fax: +44 525 713716

Oh yes,

1. I have no connection to HiSoft - I'm just a registered user of their DevpacST assembler.

2. I don't know if Lattice 5 has been released yet. Maybe when I can afford a memory upgrade I'll start thinking about C programming on the ST.

3. The 99.95 introductorary price may still hold - I really don't know. Nor do I know the US cost.

4. I don't know much, do I :-)

Disclaimer:
I just read all that stuff from a newsletter and my eyesight and typing aren't faultless. So don't blame me if Lattice 5 turns out to be Xenon III :-(

Dave.

> In fact, I would rather that Atari incorporate your suggestions into the TT.

My point was Richard, that the enhancement could be easily made IMHO and would improve life on the basic STs. Adding such features would NOT increase the size of the ROM code, but would eat at a little RAM (how much RAM does GEM need for a window, by the way? can't be more than a couple of 100 bytes)

TOS '030 has a limited future in my book, with the release of a real Unix TT with X-Windows (or something) sometime in the 90's. As we've heard before, a multi-tasking TOS is probably out of the question.

>Hey, I like MS WRITE!!! I bought it a year ago and for the few letters that
>I write MS WRITE is fine.

I agree! Lots of people don't have working copies of Write here in the UK although I do. Nice design. Shame Microsoft didn't sell Atari the sources, just the binaries...

>Heck, I couldn't even print the thing out on my Sun. Distributing straight
>TeX documentation would be fine, as the TeX source is at least very human-
>readable, but DVI struck me as a bit silly as well.

Please, let's distribut either plain text docs or source in some
markup language such as TeX or TROFF or (gasp) GML.

I resent having to cut down a tree to find out what the docs are about.
For large documents I find it easier to use regular expressions in a
text editor or with something like "grep" to find references to some
particular subject.

I further resent the fact that to reproduce the examples in the docs,
one has to re-type them by hand.

The author's claim for efficeincy may be right for one person
only, and that is the one who uses the pages to print hundreds
of copies on small paper. It does not make sense for people who
print pages on paper that is A4 size or 8.5 by 11 inches. There
is a lot of white space there!

>> HiSoft have taken over Lattice C - v5
>{stuff deleted}
>Is there any confirmation on this rummor?

It is not a rumor, it is absolute fact! I have seen the HiSoft adverts in
ST World (UK magazine) and have seen the HiSoft packaging. Haven't seen
the program yet :-) Cross my heart, hope to be flamed :-) The package
contains completely new compiler, linker, optimiser, libraries, cli,
environment (probably like Devpac), and it is claimed, produces faster code
than Turbo C! (>2000 Dhrystones for Turbo's 1690).
They are a UK company, but their stuff (WERCS etc) is distributed in the US
by Michtron.

Source record: 245947

In article <17700@dartvax.Dartmouth.EDU> dav@eleazar.dartmouth.edu
a sensible fellow named William David Haas writes:

| But.... you shouldn't distribute the .dvi. If someone can print the dvi
| file
| he probably can create it given the .tex file. I would suggest including
|
| raw text doc file - ain't pretty but it works.
| .tex file - those who want to create and print the dvi file can
|
| this makes the distribution smaller and is just as useful
^^^^^^^^^^^^^^^^^

This makes it MORE useful.

It is a big advantage to be able to extract examples of code from the text.

A second advantage (for me) is that if I chose to do so, I may select
a style that prints a different size of page, more closely approximating
a size of paper available to me. (A5 is not one of them).

3974. laser C question

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 16:30:50 UTC
From: depeche@CALVIN.CS.MCGILL.CA
Message-ID: <8912101630.AA29327@calvin.cs.mcgill.ca>
Source record: 245948

Yes, I am still suffering with Laser C... I notified the company of the
many annoying bugs which are in their latest verision (2.1) but they
haven't responded in any way whatsoever, so until I get myself PC-Speed
so I can run Turbo C 2.0, I gotta make do with what I got...

Since there is no mem.h library of routines, I use strncpy to copy the
contents of one-dimensional arrays. Does anyone know if there is another
function which does a really fast memory copy of Two-Dimensional arrays?
At the moment all I can do is nested loops of assign statements (or maybe
I could do loops of strncpys), but this is stupid. Strncpy
won't allow me to copy n*n bytes starting at the location of the [0][0]th
byte even though I know that is where the stuff I want to copy is.

If anyone can help me here, I'd appreciate it.

And if you do reply, please send me the reply in PRIVATE mail as our
newsfeed is temporarily down and I can't read news easily...

3975. 40 Folder Bug *BACK* in TOS 1.4?!

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 17:12:15 UTC
From: canada@crash.cts.com
Message-ID: <876@crash.cts.com>
Source record: 245949

The following message appeared on the San Diego Atari Computer Enthusiast's BBS. The originator of the message is quite a competent programmer/developer for the ST, so I gave his message more ``weight'' than if just anyone had posted it. Can anyone confirm or dismiss this bug report:

Message : 974 [Open] 12-10-89 12:01am
From : John Sudikatus
To : All
Subject : TOS 1.4 bugs
Sig(s) : 1 (General news)

A WARNING TO ALL TOS 1.4 USERS!!!

Despite what Atari has said about the 40 folder bug being fixed in TOS 1.4, IT ISN'T! Actually, the "40 folder" problem in previous versions of TOS may have indeed been fixed, but in reducing the amount of low memory used by TOS (in attempt to be more compatible with TOS 1.0) another bug was introduced. It seems that the directory buffers now overlap slightly with the dynamic memory pointer list. This means that when you have accessed more than about 35 folders and then try to allocate memory, there is a good chance that the program will bomb horribly. This is most likely to occur in programs that search all subdirectories on your disk (like a utility I wrote does).

I STRONGLY recommend using FOLDRXXX.PRG or CACHENNN.PRG in your AUTO folder. FOLDRXXX.PRG seems to work since the added buffers are put at the head of the list, meaning that they will be used before the original 40 (80 actually, since each folder requires 2 buffers). But one thing to note is that the size of disk buffers in TOS 1.4 has increased slightly over that of TOS 1.0 & 1.2. To get the requested number of buffers you must multiply the number of extra folders you want by about 1.06 (70/66 to be exact) and rename FOLDRXXX with that number.

Fix a bug, create a bug. That's Atari for you. Oh, well....

3976. SCROLLING DOWN THE SCROLLBAR

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 17:17:11 UTC
From: MAXG@SUVM.BITNET
Message-ID: <8912110804.AA07496@ucbvax.Berkeley.EDU>
Source record: 245950

I was wondering if someone out there would be so kind as to take a second to explain something to me about scrolling on the ST. The fact that you could not simply hold down the mouse button on a scroll arrow was one of the first, and biggest, differences I noticed between the Mac and the ST long ago when I first got my ST. Recently, however, I seem to notice that you can indeed scroll down a scroll bar in this manner in the file selector (and perhaps only sometimes?). After asking about technical support at WordUp about scrolling in the document window, they explained that this is due to TOS 1.0 and that TOS 1.4 will allow scrolling. If this is true, then why can I scroll in the File Selector? Could someone out there explain whether there is a difference between TOS's in this regard, and why I seem to be able to scroll sometimes, but not others? Thanks--

> [...] My opinion is based on my experience working
>in a computer store, working with user groups, supporting development
>tools, and talking with Atari's user group and developer support people.
>Users, by and large, want to use their computers.

OK. I have to tell you that my opinion differ from yours (You didn't know that, did you? :-) a great deal. I'm working in a TOY STORE right now, selling computers (Amigas! They won't sell the ST: They can't get any help from Atari, then - why bother? The amigas sells better.) If Atari continues doing like this, that's the way it will be. And not only here in Sweden...
The impression I have of people buying computers is that they want to learn programming, if they don't know how to do already.
People who just want's to USE software (games in my case) simly buy a video game (ie sega or nintendo).
But, the situation MIGHT be different in the US; I don't know.

>Please note: the opinions expressed in this article are mine and mine
>alone. Atari has its own.

Fine. Where can we learn ATARI's so called opinion, then? By ordinary mail to whom, say?

3979. rsrc_gaddr() question

Newsgroup: comp.sys.atari.st
Date: 1989-12-10 19:41:24 UTC
From: kclenden@silver.bacs.indiana.edu
Message-ID: <31216@iuvax.cs.indiana.edu>

I'm uploading this for a friend. I'll relay any replies to him. Thanks.

Conf : Atari ST Programming
Msg# : 272 Lines: 13 Read: 7
Sent : Dec 8, 1989 at 8:20 PM
To : ALL
From : LEN LOGTERMAN
Subj : rsrc_gaddr()

I need a little help with the use of the function rsrc_gaddr(). As I understand it, I should be able to use it to get the address of various objects in a tree. Say I have a tree, ATREE, which has an editable text field in it called MYTEXT. Here is what I normally to do to get the address of the text field:

```
OBJECT *atree;

rsrc_gaddr(0, ATREE, &atree);
text_ptr = ((TEDINFO *)atree[MYTEXT].ob_spec->te_ptext;
```

I should be able to get text_ptr with a call to rsrc_gaddr. What are the arguments that I should use?

> Hi,
> Does anyone know of any good restaurant management packages that exist
> for the IBM PC or Atari ST (or any other computer for that matter?)

There are bunches listed in McGraw-Hill's Datapro manual....here are a few vendor/publishers you may wish to contact....

Advanced Analytical Inc - 11777 San Vicente Blvd Ste 525, LA CA 90049
(213) 207-0488 (CharterHouse Rest. A/P, Inventory, Menu, Cost Control)

Computron Business Solutions Inc, 701 7th. Ave STE 9W, NY NY 10036
(212) 221-2517

Here are some phone numbers of vendors listed in the "Food & Beverage Systems" section....the info should be current:

Bottom Line Software - 503-484-0520
Practorcare Inc - 619-450-0553
Diversified Data - 602-792-3250
Techwerks - 404-426-4791
Monitor Systems Group - 800-972-1313 (or 703-556-8705)

There are more - if the ones above don't have what you need, call me voice and I will read the remaining vendors out to you (604-758-7414, 9-5 PST) - the manuals mentioned are a commercial product, and may be purchased from McGraw Hill - we have a few here on spec (they are an amazingly rich source of info for dealers and businesses needing info on hardware, software, you name it)

No, we have no connection with any of the above, MH, etc. (Just a satisfied customer :-))

I am also from Eastern Connecticut.. There are no dealers near Groton (I'm
from New London), however there used to be a dealer in Rhode Island...
I haven't been there in a while though (since I go to school in Rochester
New York). I think it is near the Warwick Mall (or in it??).

The place you mentioned sounds like Derek's Electronics right above
New Haven. A good friend of mine bought his first ST there (520), and
later purchased a Mega ST2 system from Derek's also. That's the only
Atari dealer I've been to in CT!!! (unfortunately). At least we have
ONE Atari dealer here in Rochester, but it's more like a IBM/Amiga
dealer that also happens to have STs (they'd much rather sell you
an Amiga). I recently visited Cleveland and had the opportunity to
visit two ATARI ONLY stores. Something I can only dream of around
here.

Hi...This is sort of the correct place to post this because it is being
done on an ST?!

anyway here goes:
I have a project to write which is causing me great deals of pain any help
would be appreciated..please send me mail..It is in modula-2..Here goes

The program accepts a sequence of Cardinal valuies and classifies each as
abundant(sum of the factors is greater than the number),perfect(the sum of
all the factors equal the number),abundant when the number is niether perfect
of abundant..The program displays the factors of the number.

How can I figure out the factors of a given number x..???
If I'm given the number 12738 (just a number I picked) how can I get the
computer to factor it???? Any help will be greatly appreciated!!! Ken
are you listeninmg

????? Tg
this shouldnt be quite as hard as some other things you've writen!!(I HOPE!)

REF: Stacy Laptop
Hello Dave, Your message on Stacy is sure a good news. I also ordered one from the local Atari Distributor. I plan to put Spectre 128 inside the Stacy as well as installing J. Allen's Turbo16. Recently there was a message that one Lady wanted to get Stacy for using with Spectre GCR and Apple/local talk. You did mentioned that Local talk requires a high speed communication hardware which doesn't exist in Atari. TOPS has a Flash Card designed to be installed in the IBM PC slot allowing the PC to communicate with Apple/Local Talk. How about making something similar plugging to the Atari DMA port?

Thanks, S.Suthipuntha, School of Architecture, National University of Singapore

Ref: Mac Shareware
In response to David Small's comment on the Ref. I do not think that the Mac Shareware will take away the potential Spectre user. I bought my first Mac Emulator (Magic Sac V3.0) since December 1986 and follow by V 5.9 up to V.6.1 I also bought Aladin V 1.3e. I recalled that Dave did make few quite favorable comments about Aladin in GENIE BBS sine 1987. He did mentioned about its nice Graphics, its ability to format disk within the Mac environment, etc. IMHO I think that ounce the users of this forthcoming Shareware discover the limitation of 64K ROM emulator, they will definitely go for the 128K ROM Mac Emulator At present I also own Spectre 128 and Spectre GCR. My Magic Sac and Aladin are now among my collector items. However it may be of interest to the netter that the Sun Remarketing Co. selling LISA bundles with "Mac Work Plus" which make the 64K ROM LISA to run Hypercard, newer Macintosh programs an Sysem/Finders. I am now using the Spectre GCR but I want the Mac Shareware too. Suthipuntha.

Ref: Richard E Covert Message: Panasonic Laser Printer Day One
Hello Richard, I also just got my HP Laser Jet IIp on December 8th. Due to the limited lines on my BITNET mailing system I am unable to share my experience with the IIp with Spectre GCR, PC-Ditto, TimeWorks DTP and Calamus and DynaCAD in greater detail with the netter as what you have done. While waiting for the IIp to print Calamus Documents (Only 1/2 page at a time as I bought mine with only 512K) one thing flash to my mind. As you all know that the SLM804 uses the RICOH engine but stripped all the RAM and making use of the Atari RAMs for printing thus required a minimum of 2MB computer (MEGA2) to print. However, RICOH also marketing the printer with their own brand name with internal RAMs. Would it be possible to modify the SLM804 printer interface box to fit to your Panasonic and my HP IIp so that they can be connected to the Atari DMA port. We then do not have to wait when using Atari Prg. A switch to select between DMA and Parallel/Serial will make them versatile & inexpensive printers. Suthipunth

```
Hello,

Has anybody tried to compile Sozobon C under MS-DOS ? Compiling
with Microsoft C 5.0 seems to work on first sight, but when you
run the compiler the following error occurs:

in main.c (from HCC):
if(sizeof(NODE) & 3) {
printf("sizeof NODE not mult of 4\n");
exit(1);
}

Any ideas? Please respond via email, because I don't read comp.sys.ibm.pc.

Thanks in advance, Remco Bruijne

3993. Missing AR.H from Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 11:02:15 UTC
From: remco@tnoibbc.UUCP
Message-ID: <1363@tnoibbc.UUCP>
Source record: 245866

Hello,

I got Sozobon C from the Panarthea mail server, but AR.H from the tools
directory appears to be missing. Would anybody be so kind to mail it
to me ?

Thanks in advance, Remco

If Aladin has gone public domain, why is it still being sold by the UK
distributors Signa? They are still advertising it!
It was mentioned that the authors were taken to court in Germany by Apple -
as far as I know, to avoid this, Proficomp have moved to Holland.

Chris (a Spectre 128 owner, and proud of it!(but awaiting a GCR))

3995. TOS 1.4 in oz

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 12:01:51 UTC
From: <>
Message-ID: <1209@diemen.cc.utas.oz>
Source record: 245868

Any ideas on when TOS 1.4 will become available in Australia, and how much it will cost? A friend of mine was most disappointed recently when he bought a new 1040ST and discovered that the OS had not been upgraded. Will new STs get the new ROMS?

3996. AES bug?

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 12:08:04 UTC
From: harryk@bucsb.UUCP
Message-ID: <138@bucsb.UUCP>
Source record: 245869

Have I found an AES's bug or i don't know what i'm doing?

Here is the problem:

I'm writing an ST application which is supposed to use KEYBORD-
EQUIVALENTS for almost every entry of the menus. So, (naturaly?)
i'm using the function evnt_multi() in order to handle MESSAGE
and KEYBOARD events. The thing works ok except one annoying pro-
blem:
If i press a key-equivalent, while any of the pull-down
menus is open, i'm getting the action that corresponds to
that keyboard-equivalent(i.e using the mouse i open the 'File'
menu and i place the mouse pointer on the entry 'Open', which
is becoming "selected"....now, instead of clicking on 'Open',
I press Ctrl-A (which is the equivalent for 'About xxxx' under
the menu title 'Desk'). Well, what happens is that the dilogue
box for the 'About' selection appears on the screen; and after
I exit the dialogue box, i'm getting the file selector). The
correct response should be NEITHER dialogue-box NOR file selector!

The code i'm using is the following:

```
int dummy, keypressed, msg_buffer[8], event;
OBJECT *menutree;

.
.
.
for(;;){
menu_bar(menutree, 1); /* enable the menu bar */
event = evnt_multi( MN_SELECTED | MU_KEYBD,
0,0,0, /* clicks, button, state */
0, 0,0,0,0, /* inrec, x1, y1, w1, h1 */
0, 0,0,0,0, /* outrec,x2, y2, w2, h2 */
msg_buffer, /* message buffer */
dummy, dummy, /* lowtime, hightime */
&dummy, &dummy, /* mouse coordinates */
&dummy, &dummy, /* bptr, kptr */
&keypressed, /* i want this one */
&dummy /* times */
);

menu_bar(menutree, 0); /* disable the menu bar */
if ( event & MU_KEYBD )
switch (keypressed){
........
```

```
/* case quit: rsrc_free(); appl_exit(); exit(0); */
}
else if (event & MN_SELECTED){ /* or just ... else */
switch (msg_buffer[4]){
........
/* case quit: rsrc_free(); appl_exit(); exit(0); */ */
}
} /* for */
```

The C compiler i'm using is MWC v3.0.9 but i don't think it matters
A friend of mine has Laser C v2.0 which has some AES examples in one
of the original disks! We tried to see what happens with 2 of these
examples, and we found out that the problem ALSO exists in both of them.
We also recompiled my program with Laser C, and nothing good happened!
This makes me think that it may be an undocumented AES bug(?).
On the other hand, all the programs i've seen using keyboard equi-
valents, do not have this problem!
The strange part is, that this is exactly what evnt_multi() is
supposed to do! When a menu is opened (but no entry has been selected)
the application sends NO message to the buffer..so evnt_multi() is
still active, waiting for a KEYBOARD or MENU event to occur! Thus if
a key is pressed, even if the menu is still opened, evnt_mutli()
writes the keyboard message to the buffer and terminates. ....And how
the heck am i supposed to change this behavior? How do the others do
it? You, guys, are my last hope! If i don't get any answer i'm gonna
remove the keyboard equivalents from the program (or i may leave it as
it is right now)...
Anyway, if someone out there knows the answer, PLEAAAAASEEEEE, let me
know.....I may give him a free copy of my program (what a guy, he?)

And something else. What's your reaction on the file selector? Why am
I getting the file selector after the dialogue box? I cannot give any
logical explanation. I mean, i just talked about evnt_multi() and key-
equivalents..but why is it giving me the file selector? It should be
done after the dialogue box, right? (note that the file selector is
supposed to be activated with the entry 'Open', but still i cannot
explain it!)

thanks a lot!!!!

Source record: 245872

In both TOS 1.2 and TOS 1.4, I have noticed that if a program allocates _all_ of RAM to itself, the ST will die on disk i/o with a system shutdown message. Perhaps this is the problem that Diane Barlow Close has mentioned.

This is not directed at Ken or Allen, OK?

My family followed Atari's upgrade path and got a Mega2 after we sold our 1040. We love it and use it for more than we ever though we would. Now I'm trying to decide on a computer to take to school with me. I've really been leaning toward the ST, especially since I have the Spectre 128 (If I get an ST I'll probably upgrade to the GCR).
*** BUT ***
Now I find out that Atari crippled the Mega2s in an effort to rip off it's customers. I can stand bad support, but that's outrageous! I'd rather not buy a computer from a company that does stuff like that. Planned obsolescence was _supposed_ to be a joke.

Will Atari's support improve?
Will they quit making computers with unnecessary limitations?
Will they be around long enough for me to buy a STACY4? (I've given up on the ATW)
Will I have to get an Ameoba with A-MAX instead?

stay tuned next week...

I suppose I should wait for the response, but: I'd also like to know if registering as a developer is an all-or-nothing package? Last I heard, Mark Williams C was part of the $300 deal. I already have a C compiler that I'm happy with (Laser C); is there a lesser-priced option that omits MWC? I'd think there'd be more than a handful of people that like to know the answer to that.

Not even the latest versions? The most recent ST Writer I've seen
(2.something) has a GEM mode, in which you can use the mouse, file
selectors, etc. Does Thunder still not like ST Writer, or perhaps
did you have an older (pre-2.0) copy of the latter?

>

That is the tool that I was referring to. It was a special 'C' library
that allowed you to compile Mac C code on an IBM PC. Then the new PC code
would execute EXACTLY the same as the Mac code. it seems like a simple enough
idea.

And it seemed like a real neat idea. Because you could port the 'C' Library
to other machines, such as the Atari ST. Then, MicroSoft could recompile their
MS WORD for the ST. It would open up a whole world of Mac software for the
ST. And the PC. And the Amiga.

It is a shame that the library isn't readily available.

And furthermore, Atari's new developers program appears to cut off
the PD/shareware community from access to internal documentation.
If the "non-professional" developers had to rely on the wealth of
information available from book publishers on programming the ST
we would all be out buying Macs, Amigas or (gasp) IBM clones.

Why don't you guys just cut your own throats and get it over with :-?

4008. The Cabbage Patch Doll of Christmas 1989!!

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 16:40:20 UTC
From: covertr@force.UUCP
Message-ID: <475d5540.14a1f@force.UUCP>
Source record: 245882

My local PBS TV station had COMPUTER CHRONICLES on last night. CC had a special Christmas show where they were showing thigns to buy for XMas gifts for IBMs and Macs.

Anyway, at the end of the normal show they have a segment called "Random Acess" where they announce latebreaking news. They had a small announcement of the Atari LYNX. The segment had the Atari name and Fuji logo on the screen. they compared the Lynx to the Ninetendo Gameboy and liked the Lynx more. Anyway, CC said that since 'only' 70,000 Lynxes were being shipped before Christmas that the Lynx may be the "Cabbage Patch Doll" of this season!!!

so, anyhow it was nice seeing Atari in the press. Did anyone happen to catch this announcement??

P.S. The first season that the Cabbage Pacth Dolls were sold, they were sold out weeks before Christmas!! And folks were hunting for them everywhere!!

> 4. bitmapped + ST + HP Laserjet without PS support
>
> 4. is so far behind the others (that was the 44 minute job I referred to)
> that it is not an option you want to consider.

Greg, I *HATE* to admit that you are correct (because that implies that I was wrong and I am *NEVER* wrong :-)) but I ran some more tests and the bottleneck in printing speed is definitely the parallel interface. ISD on Genie says that their file "printer.cdk" takes 34 seconds on an ST/SLM804 combo. The same file took over 4 minutes on my souped up MegaST4/T16/Fast hard drive/KXP4450 system. Quite a bit of difference!!

Thank God I don't do much DTP work on my machine. The SLM804 is definitely the way to go for ST-only DTP work. And with the new PageStream 1.8 you can put together a great magazine entirely on the ST.

so, while I am still happy to have the KXP4450, for others the ST/SLM804 will be a better system. Each to their own, that's what makes the ST so great.

Thanks for your comments.

> THIS PROGRAMER/USER/etc... AND MORE THAN LIKELY--A ((FEW)) OTHERS TOO!!!

But why should Atari support the end-users/public domain programmers? Most people who own computers have absolutely no desire whatsoever to program it. They just want to _use_ it and possibly play games one it. _THAT'S_ it. They don't give a damn if Turbo C is available for their machine, they just care that WordPerfect's available for it. All the people who've been sending flames to Ken _are_ way off base. comp.sys.atari.st is by no means an accurate representation of all Atari end-users out there.

However, I do wish Atari would make some of the ST's technical specs available for any end-user who wants it, but doesn't have the money to get the Developers' Package. So, I humbly suggest to Atari, to allow us end-users who _want_ to program, but don't have the money, to let us pay for the tech specs, but not get the full fledge Developers' Package.

In other words, what I simply want Atari to do, is allow for something similar to De Re Atari for the 8-bits. If we (end-users) really want the technical info on the ST's, we can order them from Atari, without having to become a developer. And for those 90% end-users who don't _care_ about programming, they won't be affected.

How about it, Ken? A little extra money to be spent, but it'll sure help out all the public domain authors a lot.

John

A small outfit near Baltimore called Toad Computers makes the
same 44 Mbyte removable cartridge for less than Atari charges.
They put an ICD disk controller and a Syquest drive in your choice
of boxes with power supply and SCSI interface. We have been using
one with our ST for three months and it works well so far.

I noticed some talk about cartridge port add-ons etc.
I bought the one offered by EABCO and have subsequently used it and
am pretty much finished with it.
If anyone would like it, I'll let it go for 5.00
It adapts the cart port to a 22 pin edge connector suitable for
plugging a prototyping board onto it..
anyway I paid 14.95 plus postage..so its a good deal I guess.
Nothing has been done to it and it is in perfect condition.
call or e-mail me at my sig addresses..

From: pegram@uvm-gen.UUCP
Message-ID: <1365@uvm-gen.UUCP>
Source record: 245893

I have an old (1985, Rev B??) 520 ST. Sometimes, after an afternoon of "mouseing around", the keyboard and mouse stop working completely (no response to either, programs wait quietly for input). A reboot effects a temporary cure, but communication between computer and keys-mouse is rapidly lost again. I have removed and cleaned the IKBD processor, but it hasn't helped. Only shutting down for a while fixes the problem for any period of time. I have some questions:

1) Is this a known problem? If so,

a) Am I correct in thinking that it is a loss of the serial link between the keyboard and processor board, due to heat?

---> b) Which end is the culprit - motherboard receiver i.c., or the
---> socketed IKBD (easy to replace 8-)) processor?

c) If the problem is heat related, can I fix it by adding a heat sink of some sort?

Email replies if possible. Sorry to waste bandwidth if this has come up before. Thanks in advance for any help.

4020. Great Games for ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 19:30:50 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891211.13293081.028979@SFA.CP6>
Source record: 245894

Chris Edgington writes:

"I can't decide what game I should ask for for Christmas for my ST. Tell me what your favorite games are and why so I can make the best choice."

I'll mention graphics-type games. My number one favorites by order of preference:

1. Xenon2 -- -- -- MirrorSoft (why go to an arcade anymore?)
2. DungeonMaster -- -- FTL
3. TimeBandits -- -- MichTron

My personal requirement for a game is its duration of keeping me interested, graphics, sounds, and user interface. TimeBandits is the old MichTron classic. It is awesome and I've been playing it since 1986. I've yet to finish it. It is an old friend, has great scrolling abilities and fine graphics.
DungeonMaster will cause you to fail your classes, call in sick, and go without eating. Graphics are great and the sound, though repititous, quite good.
Xenon2 is my new toy. It is so good that it should be banned. The graphics are of the calibre of "You mean you can do THAT on an ST?"
All three of the above games have a user interface that allows not only the beginner but also pro to survive and have an enjoyable session.
Descriptions:

1. Xenon2 -- Space type shoot'em up. But it ain't nuthin like you've experienced before. BREATHLESS
2. DungeonMaster -- Dungeon exploration game.
3. TimeBandits -- Also an exploration game, but with many themes. Has multiple "games" and themes. SO VERY GREAT.

Potential great game:

1. BloodMoney -- awesome graphics, great scrolls. Has the same great graphics as Xenon2.
PROBLEM: -- Has stupid copy protection. It may or may not work on your ST. Insane if not criminal copy protection method will kill this fantastic game.
ADVICE: -- Try this one out first before you buy.

All three of the first mentioned games will work on TOS 1.4, at least on my Mega2 with a four-meg memory upgrade and newly installed TOS 1.4. I can't speak for 520K STs, though, whatever those are (grin).

Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

4021. Re: 40 Folder Bug (*NOT* back in TOS 1.4)

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 19:47:14 UTC
From: apratt@atari.UUCP
Message-ID: <1876@atari.UUCP>
Source record: 245895

Mr. John Sudikatus, quoted by Diane Barlow Close, suggests that the 40-folder limit has returned with a vengeance in TOS 1.4.

He is wrong.

He says that the space where memory block descriptors are maintained and the space where directory node descriptors are maintained overlap. This is true. But this is no bug: both data structures, and some other things, are dynamically allocated out of the same pool of memory (called "the OS pool").

He says that using FOLDRXXX.PRG will alleviate the problem. He is right, but not for the reason he thinks.

The root of all this evil is that the OS pool itself is statically allocated. There is only so much room there, for directory descriptors, memory block descriptors, and open-file descriptors. Using FOLDRXXX.PRG adds more memory to be used for these things.

The original problem with the pool was that it was not only statically allocated, but it was also managed poorly: once a piece of the pool was used as (say) a memory descriptor, it was forever tagged as a memory descriptor, and could never be used as a directory descriptor. Starting with TOS 1.4, this is no longer the case. When something allocated from pool is freed, the memory becomes available for any other data structure which is allocated from the pool.

Furthermore, once a directory descriptor was allocated from the pool, IT WAS NEVER FREED. It stood forever, recording its place in the directory structure, even if you never used that directory again. And it was allocated if you even so much as SAW the name of the directory in a window, let alone actually opened that directory. I fixed that, too, so only "active" directories take up memory in the pool, and others can be freed when the memory is required for something else.

That's why I say that TOS 1.4 pushes the limits of the admittedly-evil static OS pool farther away than previous OSes. And using FOLDRXXX.PRG adds pool (for all its uses, not just folders), so you can push the limits arbitrarily far.

Finally, CACHEXXX.PRG has nothing to do with any of this. CACHEXXX.PRG adds sectors to the sector cache which GEMDOS uses, and therefore saves disk accesses. The cache is managed with a "global least-recently used" algorithm, which means that the last N sectors you used are in the cache. You can see this most dramatically if you use "Show Info" from the desktop on a hard disk drive with lots of subdirectories and files. "Show Info" goes down the entire directory tree and reads each

sector of the FAT. Do it once, and the disk light will stay on for a while. Do it again, and the same thing happens. Now run CACHE080.PRG and try "Show Info" twice: the first time, the same thing happens. The second time, the disk light doesn't come on at all, because all the sectors are already cached. This speedup is even more dramatic with floppies!

Sectors are eligable for this cache when they are read by GEMDOS itself (like directory and FAT sectors) or when they are not read in whole-sector blocks. Disk reads which span entire sectors are transferred directly from disk to their destination in user memory.

Please feel free to pass this message along, especially to the place where Mr. Sudikatus' message appeared.

Diane, ATARI has stated from the beginning the 40 folder bug was being reduced to levels of improbability, not removed.
Further, in the Developer docs (I know, you didn't buy them; I did) it further states that lots of recursion in subdirectoried will definitely require using FOLDRXXX.PRG.

Someone once said that any program larger than a page is never fully debugged. I'm sure that there still reside bugs with TOS 1.4, but its reality, not the "ATARI" syndrom that will cause them.

> new to that arena.

Actually, the DEC Professional series machines were also classified as
"personal computer". Also, I never said that personal computers used
up-to-date technology. It is just that said technology was introduced
before, and was in common use by, 1982. Since this technology was available
before the ST and TOS were on the drawing boards, I might expect product
designers to have seen it as a possibility when they were specifying the
functionality for the ST operating system. The people at fault here
are mostly the DRI designers and programmers who had their heads stuck
firmly in the sand of the CP/M world and had too little time to even do
CP/M right for the ST platform.

> Secondly, how do you know it's 1982 technology if you

> It's quite well done, believe me.

See the above about the age of the technology. I have a fairly good
background in these things and have seen at least two systems where you
not only get a list of what options and versions you've got installed
on your system and the modes they may be in, but also pointers to routines
that allow a program to hook itself onto the device with inclusive or
exclusive access, etc. I won't go into detail here. The IBM-PC BIOS
has had a very limited version of this feature since its introduction.

> old software.

> <off the soapbox and back to comp.sys.atari.st>

Well, I'm not privy to the cookie jar info at this time, but I believe
that Allan Pratt can vouch for my credentials in the area of ST development.
I've been developing software for the ST since 1985, and although Atari
has lost track of my Registered Developer status over the years, I was
a registered developer. In my previous position with the Mark Williams
Company, I assisted and encouraged ST developers and end-users alike,
helping them to program in the ST environment both through the development
of the (IMHO) most complete and easy-to-port-from-other-systems-to C language
programming system available (including a major hand in the documentation),
but in long hours of phone support and hand-holding. I also used to
talk with the Atari people via. telephone on a fairly regular basis.

I've spoken in the past with various software people at Atari about
changes and fixes to TOS which would maintain a high level of compatibility
with previous versions but offer new and extended functionality to newer
applications. I have always encouraged the development and improvement
of the ST environment, and will continue to do so even now that I'm not
actively developing commercial software for the ST.

My comments to the network were to prod a bit more information out of
the overworked and overloaded Ken B. and Allan P. and to let them know
I'm still around. I don't believe that my comments will either discourage
or even overly annoy those folks. I know what kind of constraints they
are working under, and I understand why the evolution of TOS has been so
slow, but the fact that I know these things inside and out does not
prevent me from having an opinion and expressing it.

Please don't take what I say in my rare critical postings as a damning
of what the programmers and engineers at Atari are doing. Most people who
have been on the net for more than a year know that I generally post
constructive, positive and helpful information. I've been rather quiet
for the last year, but that's because I have limited network access
and not very much time to spend reading or posting messages.

This reply is being made to the newsgroup because your flame at me
was made to the newsgroup and I don't want people putting me in a
class with the Atari-bashing denizens of this group.

Please direct all flames in response to me via mail.

4025. Addendum: ATM & Spectre

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 20:52:51 UTC
From: mjv@iris.brown.edu
Message-ID: <22615@brunix.UUCP>
Source record: 245899

First I will take Dave Small's advise and make this small (no pun intended, well, ok maybe some) statement:

In a previous article I made some comments about legally obtaining Apple products. Those comments were just In My Humble Opinion and I do not have any legal expertise in which to say they are fact. Please take those words as opinion and not fact. In other words, don't try it at home kiddies.

Nice to see you on the Net Dave S.!

Well, on with the show:

I've found out some more things about the Adobe Type Manager. The only fonts that you can use are Type 1 Adobe _Encrypted_ fonts. Type 3 fonts will not work. Type 3 is the general PostScript font format used by most third parties. Type 1 Encrypted is a special format that has hints in it to produce more legible type at lower pritner resolutions (read: 300dpi). This practically kills the PD Postscript market for ATM so make note of this before you buy fonts. Also, Bitstreams PS fonts which ARE Type 1 format will NOT work either. Bitstreams says they will fix this soon. So basically for now, you are limited to the Adobe catalog of fonts ($$$) and the Linotype library.
The area where people will see the best results from ATM will be the 3rd party laserprinter and ink jet owners such as the HP laserjet and inkjet. These printers will be able to produce outstanding fonts at low point size. Low point size fonts on dot matrix printers will look about the same. High point size fonts will look good on both printers. (this fact has made a lot of ImageWriter owners mad since ATM was originally pushed on them.) Basically, it looks like people who have the ink jet and other laserprinters (like Rich Covert's Panasonic) will do wonderful job mostly since there are printer drivers available for them. (the Panasonic emulates an HP laserjet if I remeber correctly.)
The speed of ATM starts to really bog down when you have a large variety of fonts that it calculated on screen at once. Most this will only happen when using desktop publishing software and especially when zooming in really close on files.
On a stranger note, a friend reported to me that when he printed out the logo for his company on his imagewriter with ATM installed, the logo printed slighty different each time. This was a small SuperPaint 2 file. I'm going to look into this a bit more. The changes in the logo were subtle but enough to be noticeable.

Enjoy!

-- mjv@iris.brown.edu

[all words are IMHO and not representative of my employeers. I don't work for HP or Panasonic, though I once lived in a town where HP had site, and I do proudly own a Spectre GCR and would recommend David Small's work to anyone.]

4026. CYBER VCR

Newsgroup: comp.sys.atari.st
Date: 1989-12-11 22:45:08 UTC
From: mike@pixar.UUCP
Message-ID: <8070@pixar.UUCP>
Source record: 245900
Cross-posted to: rec.video,comp.sys.atari.st

This is a followup on my earlier request for information on using the Atari ST as an edit controller.

Many thanks to Patrick (patrick@hpmcaa.mcm.hp.com) for providing the name "CYBER_VCR". I was able to discover this product at several loacl Atari Dealers, and bought a copy at Berkeley's MicroWorld ~$60 after a 15% discount.

The product consists of a disk an adapter that connects the ST's parallel port to a SONY control-L socket. Being me, I popped open the connector and found an NPN transistor and a couple of resistors.

I couldn't tell from the connector whether communication with the computer is two way or not. I suspect the software sits in a loop and noodles a data or control bit to send packets. I'd much prefer communication via a standard serial port instead of the parallel port, both for portability to other machines and for efficiency.

The software, written by Tom Hudson, wastes no time on pretty icons but is still pretty nifty, allowing a color Atari ST to record a sequence of images to video tape. Unfortunately, you must have a system with al least 1 meg of memory, AND the ability to generate a composite video output. Can you say oxymoron? I have both a 1040 and a 512st and neither one will run the software. However they do give a list of folks who provide 520 memory upgrades and/or 1040/Mega RGB to composite converters.

I haven't used the product yet, but it claims to be able to display animation loops, stills, and wipes, sourcing a long list of ST image formats (neochrome, degas, CYBERPAINT0. Alas, no spectrum 512.

The manual is written in Tom Hudson's usual direct, lively style, and contains some good historical "anecdotes". I must mention that the definition of composite video he gives is only approximately correct but good enough for software folks. (Composite really means that sync and picture information are mixed, and does not refer to mixing of color channel information).

Thoughts on Control-L:

CYBER VCR's timing is in units of frames, and this got me wondering if single frame record is possible using control-L. I suspect, however, that the ST simply moves the video base address around to accomplish frame accurate timing, and uses control-L to manage the less time-critical functions of pausing the recorder.

So - I have some exploring and experimenting to do here. The idea of
using a personal computer talking control-L to control video equipment
is something I bet we're going to hear a lot more about in the near future.
Maybe this will do for video what MIDI did for synths.

First, thanks to Ken and Allen @Atari for being here (RCSU, BRSU). Second, to either: What is the format of the new TT screens, where can one get this info? Related subject: I heard rumors of lower cost docs to developers; true/false? Have you considered one-shot sales of a developer style package, meaning you don't provide any additional update info without more cash? This would hopefully be even cheaper, and maybe within my range.

4032. Technical Documentation (where??)

Newsgroup: comp.sys.atari.st

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

This is mostly in reply to Ken.B's comments but is also available for
the rest of you to comment upon.

Ken,
I would like to say that just because a large number of users do not want to
program on their ST's this is no reason to provide almost zero information
with them. When I bought my ST I was expecting to get a nice user manual
with it, but instead I find a flimsy pamphlet which almost but not quite
describes the use of the desktop. The only technical information supplied
is in the manual for ST BASIC and if my memory serves correctly, the actual
quantity of hard facts or system information is the square root of nothing!

I don't know whether you non-British folks have heard of the BBC Micro
manufactured by Acorn (of Archimedies fame!) but this came supplied with one
of the best manuals that I have ever seen for a micro computer. It had loads
of system information, by which I mean things like memory maps, and system
call vector addresses. They even put a small paragraph in the manual about the
system routines, saying that they were not trying to hide the OS from the
programmer, infact they were being as open as they could be, whilst allowing
for future expansion. The use of vectors allowing the OS authors to
completely change the inside of the ROM anytime they liked without affecting
well written software! This meant that BBC Micro software was very robust, and
that no one really worried too much about OS versions, unless they specifically
wanted the extra facilities offered by it.

If a BBC Micro developer wanted to get all the information they could about
the machine there were (still are! :-) three other manuals available at about
20 pounds each (translate to dollars yourself). One for advanced programmers,
one for basic disk drive information and one for advanced disk information.
That was it! You didn't need anything else!

My point is that if that much information can be supplied for a machine that
was in its day what the ST is now, why was no technical information supplied
with the ST? Sure teach someone to use the desktop, but after that they are
locked into just using packages. Alright so packages are important, but they
don't all get written by professional developers. Many of the ST programmers
are like me, enthusiastic amateurs (sp?) who develop software for pleasure/
fun/the_hell_of_it ! I can't afford to pay the developers license inorder
to get the docs, but I would like a few basic facts about my machine!

I personally think that the attitude you take as far as non-professional
programmers is concerned is arrogant (sp?) and not what I would expect
from an engineer. Heck, most engineers (software or otherwise!) can't shut
up when you ask them about their 'baby' and they can never go to too much

trouble to be of assitance. To use your least-favorate analogy, it's like
a car salesman telling you that you can't find out what's under the bonnet
until you get your advanced drivers certificate!

This not really a flame, as I don't hate anybody, just an observation on
a lamentable ommision! However, constructive debate on this matter would
serve a useful purpose.

And if Ken would be so kind as to tell me an address I could write to, then
I will write another version of the above and send by Snail Mail in order to
make my feelings know to Atari UK/USA.

As a parting shot, I intend to stick with the ST, despite the lack of support,
because it is a good machine, but it doesn't mean that I have to like having
no docs. If DEC or IBM tried to sell a machine without docs they'd be laughed
out of the business!

4033. High resolution monitors

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 01:54:42 UTC
From: w-darekm@microsoft.UUCP
Message-ID: <9409@microsoft.UUCP>
Source record: 245807

Quick ST has been updated to handle high resolution monitors.
It now supports any sized monitor, whether 1280x960 or 640x400 or some other size. To get this free update, reply to this message, and include your name and address. Only registered users of Quick ST can receive this update. Also state the kind of monitor you will be using. I am interested in finding out what is most common:
- Viking Moniterm
- Hyperscreen
- Bigscreen (hi res emulator)
- other (???)

Unlike earlier versions of Quick ST which support hi res monitors, there is no speed loss when using the non-standard resolution. For example, the Viking Moniterm gets a 1200% boost in the speed of text printing, and almost 100% in GEM operations, the same as with the standard 640x400 screen.

Howdy. I submitted those fonts and the accompanying ASSIGN.SYS file.
I put in the opening comments "This file was written for use with
G+Plus" ... I've never tried to use it with Atari's GDOS, so that'd
be the first thing I would suspect.

I guess my advice to you is to merge what's in the provided file with
the ASSIGN.SYS you've already been using. The CodeHead guys included a
file GDOS.DOC with their stuff that describes the ins'n'outs of writing
an ASSIGN.SYS file. I think it's freely distributable, I'll send it to
you (or post) if you want.

Source record: 245810

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

With regard to the existance or non-existance of commercials for ST's,
there is currently a two minute (approx) commercial running on our
commercial television networks. This displays the ST in the manner of
a general purpose computer, showing it capable of colour graphs,
full colour graphics with animation, games and something else that
escapes my memory for now!

But it is near Crimbo after all, so as soon as December is over, so, I
imagine, will be the advertisment campaign!!

Just thought you'd all like to know

4038. booting from floppy

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 03:30:35 UTC
From: parker@vlsic2
Message-ID: <101870@ti-csl.csc.ti.com>
Source record: 245811

Boot from floppy with ICDBOOT software

I am having a problem trying to boot from the floppy disk while
using the latest (at least I think the latest, less than 2 mths old)
ICDBOOT software with my hard drive.

According to the manual, if I depress Ctrl/Shift/Alt while booting, the
computer will boot from the floppy instead of autobooting from the
hard-drive. I have a copy of ICDBOOT.prg in A:\AUTO folder but not in
C:\AUTO as instructed in the docs.

Well....no luck.
I have tried all combinations of softboot/hardboot, wait till the floppy
lite comes on and goes off, and so on as recommended in the ICD docs
that I got with the kit...and all I get is the default ROM desktop.
It doesn't autoboot from the hard-drive, but it doesn't read the floppy
either, it just comes up with the ROM 2-icon desktop.

The whole point was so I could boot from floppy on those rare occasions when
I wanted to use a GDOS application. I have a stock 1040ST with TOS 1.4.
Can anyone shed any light on this situation? (And I don't mean get G+PLUS!).

Thanx for any replies.

>MWC?

I did just what was suggested above. I forget the price, but the main issue is
that some of the most useful Atari utilities are normally considered a bundle
with the C compiler. Stuff like MADMAC, Atari db and aln. I presume there
would be no problem re-selling MWC if you REALLY don't want it. The hassle
of getting the important stuff without the compiler just isn't a good bargain.
(Note: everyone I've ever spoken with at Atari is very helpful, and wants to
solve problems. This seems to be an inherently confusing situation.)

This may be some what of an ignorant question BUT here goes.

Having written in ST Basic (I KNOW, DON'T FLAME ME) some engineering programs for antennae design and helical filter design, i was wanting to improve (with ST Basic, HA!) the programs and produce runtime only code rather than having to rely on the interpreter environment.

So, is there available (?) a compiler, even PD for ST Basic. If not i will have to rewrite the programs in GFA Basic V3.0 (after i buy it) or even in Hisoft Power Basic (also if i buy it). Any help or even enlightenment would be most appreciated.

1040 ST with color monitor bought on 7/1/89 with modem for immediate sale as
I am upgrading to Mega 2 with 30M hard disk and Laserprinter.

Must sell by 12/19/89 to get the new machines.

Bought for $1100......yours for $900. Will ship within US / original cartons.
Works perfectly....no problems.

Can also sell items as follows:

A= 1040 ST (with Mouse and w/proc s/ware + builtin 720K 3.5" disk) $500

B= "A" as above with color monitor $790

Please send me email or call me at (212) 749-1155

Steve, I know what you mean. I've found a solution in a shell script
that's run by my cron process after UUCP and UUXQT have done their thing
in the middle of the night. (Since this is a single-user 7300, it's not
like censorship or anything...)

Try:

cd /usr/spool/news/comp/sys/atari/st (get to ST notes storage)
rm `grep -il "covert" *` (remove all covert notes)

Put that into an executable shell script (remove.sh?, say, with the
execute bit set), then add a crontab entry to call it once after the night's
downloads are done. Be sure to allow plenty of time for UUXQT to unpack all
the
individual notes.

The "-i" option makes it ignore upper/lower case, and the "-l"
option makes it generate a list of filenames, which in turn are fed to rm.
Note the symbols around the expression are not single quotes...

-- Hope this helps, Dave Small / Gadgets by Small, Ink.

p.s. This note should only be read with tongue firmly planted in cheek.

4048. Re: Seagate 296N, 277N

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 08:13:42 UTC
From: dsmall@well.UUCP
Message-ID: <14930@well.UUCP>
Source record: 245822

The basenote discusses the 277N drives and interleaves.

Steve, I have both the 277R and 277N; the 277R runs with an OMTI 3527 controller, that I recommend without reservation, at 1:1.

As you may know, the Spectre v.1.51 had a problem with the 277N. File copies to the 277N, when the drive was formatted at 1:1, would sometimes fail. We *finally* tracked it down to the Seagate onboard controller board. The board was not capable of accepting SCSI commands immediately after transferring data; a delay was needed. This is the first drive we'd seen that required this delay, out of many. (And heck, maybe *we* are the ones out of SCSI spec).

My 277N worked fine under TOS at 1:1 interleave, so my guess is that Atari is using different I/O code with a delay, or the natural overhead of GEMDOS is adding sufficient delay. It doesn't take much to make the 277N start working with 1:1 -- just turning on Spectre's disk monitor will do it.

I've been told repeatedly that Seagate has done many different revisions of the controller ROM, some to try to fix this problem, by manufacturers who buy the Seagate products in quantity. (It drives them up the wall, too.) Hence, my 277N experience may not apply to you, so you know.

Nowadays, we recommend "Slow SCSI" or 1:2 format on Seagate 277N, 296N, and 157N drives. I think possibly the 4096 80 mb unit wanted it, but can't recall.

Hope this helps some.

4049. Re: Prodigy run under Spectre GCR?

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 08:22:59 UTC
From: dsmall@well.UUCP
Message-ID: <14931@well.UUCP>
Source record: 245823

The basenote talks about Prodigy not working under Spectre.

Bob, don't give up hope on Prodigy. It's already running under AMAX, the Amiga Mac emulator; tweaking a flag called SCSIflag to a different value is required. We've been chasing it with our in-circuit emulator, the only equipment that will penetrate Prodigy, and trying to figure what's wrong.

The program basically boots, then freezes. The ZAX tells us the interrupt level has been set to 7, which locks out all interrupts, and it stays there. Not very many ROM calls are made -- they are mostly "what time is it?" calls. I *think* --I don't know -- that Prodigy takes over the whole machine, polling for keyboard input, serial input, doing serial output.

Prodigy has been most helpful with us and we've dug our way through management there to some of the programmers. I imagine what it'll boil down to is determining exactly what part of the Mac's architecture they're dependent on, and hacking around it.

So, please don't say it's not ever going to happen, ok? It might even be up by the end of the year; it's been a priority project here.

-- thanks, dave / Gadgets

4050. Re: Apple roms.

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 08:38:37 UTC
From: dsmall@well.UUCP
Message-ID: <14933@well.UUCP>
Source record: 245824

The basenote is discussing Apple ROMs and what happened when IBM was cloned.

I had an interesting talk with an Apple market-intelligence person at Comdex. What it boiled down to is there's a third factor here: 3rd party software developers. If there were a cheap clone-Mac available, those developes would probably see an increase in their sales, and this would thus benefit them.

Yes, it's not 1985, when Mac developers were starving. However, the Mac is still having to compete with reams of MSDOS Clones, and there's plenty of companies who look at installed base (Mac vs. MSDOS), ease of development (the learning "cliff"), and potential market, and don't do Mac products ... or do limp ports of PC products.

Obviously I'm not unbiased in this. However, I would like to see Apple license out its 64K, possibly its 128K technology, to clone makers under tight control, to produce an inexpensive Mac. Given that Tramiel can sell a 520 ST for under $300 (if I have that right -- if not, it's close), this would help encourage third party software development for the Mac. A case history would have to be the Commodore 64. Get enough installed, and development
will happen, as developers see the potential market.

Probably such a machine would have to be configured not to compete with "classic" Mac products like the SE. (I have been told the Plus has gone out of manufacture, so it's irrelevant). Perhaps limits on the clock speed,
RAM availability, or no System 7 compatibility would reassure Apple that clone sales would not damage Mac sales. And those clone royalty checks certainly are not going to hurt anything -- if I heard right, Apple made a mint off Adobe stock.

Obviously this is tentative and speculative. What's interesting is that these were the opinions of the person I was talking to!

Maybe, perhaps Apple is realizing there's more than one way to "have it all".

-- thanks, Dave / Gadgets

From: jackin@vehka.uta.fi
Message-ID: <766@kielo.uta.fi>
Source record: 245825

Well, I've read two magazine reviews that tell us a whole different story. In december issue of ST-magazin (W-Germany) the reviewer said that Stacey will not have a backlighted display (plain LCD, not good). On the other hand, in December issue of PCW (Personal Computer World, UK) Stacey was a cover article and the reviewer said it has a back-lighted display, which is one of the best he has seen. In fact he had two different machines (both had backlighted LCDs). Also David S. wrote how good the display was (a few articles back, here).

I believe that Stacey has a backlighted display, which is very good.

I don't read this group (at all) but I'm looking for a net group where I might find people knowledgeble on the Atari "Portfolio" pocket computer. Has this machine been discussed/reviewed on this group? If so, could someone email me a synopsis of the messages?

Basically, I'm looking for someone who may have one. Is it worth having? Is the keyboard acceptable? What kind of info is available on non-ROM software. Will there be user programmability in some form?

Sorry if this is the wrong group. If so, could someone point me in the right direction. Thanks.

Well.. TOS 1.4 *did* crash on me once, when I tried to access a folder (not sure of how many I had accessed before). I at the time had cachexxx, and now I have foldrxxx (foldr100 to be exact), and haven't had the problem happen since.

Source record: 245833

Yes I have, lots of it. What you don't realize is that just because Apple needed 128k of code, and N man-years of work doesn't necessarily mean that the task at hand needs that. Depending on the skill - and more important - insight - of programmers, the same task may result in solutions that are very different in code size and time taken. I have examples at hand of functionally identical programs, one of which is twenty times the size of the other. And the large one probably took fifty times as long to debug. I've never disassembled a Mac ROM, so I can't give any views on the quality of the code therein, but knowing (a) how slow a Mac is and (b) that some at least of the code was written in Pascal (probably by some structured programming fetishist) I suspect that most of the code is pretty awful.
Of course I wasn't necessarily advocating that anybody actually try it; knowing Apple's penchant for suing everybody, I'd have every incentive to make any machine I designed as unlike a Mac as possible.
Anyway, is there really any genuinely indispensable program available only on the Mac? Even if there were, it would probably be an easier task to patch the program to run on the ST than create an (even slower) Mac emulator.

James Parker writes:

"I am having a problem trying to boot from the floppy disk while
using the latest (at least I think the latest, less than 2 mths old)
ICDBOOT software with my hard drive."

No luck here either. I also, when using methods described by
James and my own, get only the 'standard' desktop. The problem also
applies to any floppy that has a program in the /AUTO/ folder. The
only way that I can boot off floppy is during a power off of the
hard drive... Not good.
Interestingly, copy protected games ignore the hard drive and
allow the floppy to autoboot.

4064. vdist.prg version 3.3

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 16:18:37 UTC
From: powers@harpo.enet.dec.com
Message-ID: <6822@shlump.nac.dec.com>
Source record: 245838

Has anyone been using vdist.prg version 3.3 from the desktop,
and are getting it to work on TOS 1.4? When I run it, it loads
the file to view, and all the fonts, but the window that it is
supposed to be displayed in, is shaded gray. The same symptoms
appear, when I run it from Neodesk. The odd thing is, it works
fine, if I first run MSH, and then do a 'gem vdist' from within
msh. Anyone have any ideas/clues as to why this is?

4065. Re: Detecting Mark Williams' redirect

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 16:21:54 UTC
From: dag@per2.UUCP
Message-ID: <885@per2.UUCP>
Source record: 245839

In article <1777@ncrcce.StPaul.NCR.COM>,
rogers@ncrcce.StPaul.NCR.COM (Bob Rogers) writes:
> Does anybody know how I can detect (from within a Mark Williams' C program)
> that standard input has been redirected (i.e., I need something like UNIX'
> isatty()).

I think that you might find that there is such a function hiding in the
Mark Williams libc.a, but I don't remember for sure. I know that various
MWC tools use one internally (I used to work there). If there isn't
one in the distributed library, it is fairly simple to write one.
Unfortunately I'm not at home (where all my ST stuff is), but I'll give
you some pointers from memory. I'd suggest looking at the entry for
crts0.o in the Mark Williams C manual.

Assuming that the program is started from the Mark Williams (or some
compatible) shell or some program which uses the Mark Williams execv()
or execve() functions, something like the following should work:

```
------ Begin example code --------
#include <stdio.h>
int fisatty(fp) /* function to determine if FILE is a TTY */
FILE *fp; /* the file to look at. */
{
extern char *_iovector; /* see crts0.o entry in MWC manual */
register int c; /* a place to store a character */

if (fp == NULL) /* don't die on unopened files */
return 0; /* and don't call them ttys */

c = _iovector[fileno(fp)]; /* Get the stream type from the IO Vector */
return (c == 'C' /* true if console (keyboard/screen) */
|| c == 'A'); /* true if serial (AUX) port */
/* false if anything else. */
}

int isatty(fd) /* function to determine if a file descriptor */
int fd; /* refers to a tty. fd is the file descriptor. */
{
extern char *_iovector; /* see crts0.o entry in MWC manual */
register int c; /* a place to store a character */

if (fd < 0) /* make sure we've a valid fd */
return 0; /* if not it can't be a tty. */

c = _iovector[fd]; /* Get the stream type from the IO Vector */
return (c == 'C' /* true if console (keyboard/screen) */
|| c == 'A'); /* true if serial (AUX) port */
```

```
/* false if anything else. */
}
------ End of example code --------

If you want the printer to be a TTY, add an "|| c == 'P'" to the returned
expressions. If you don't want AUX to be a tty, remove the "|| c == 'A'"
from the returned expressions. If you want anything but known disk files
to be called TTYs, replace the returned expressions with "(c != 'F')".
(These routines can be optimized. I'm just trying to illustrate how to
do it.)

I believe that the range checking on the isatty parameter value should
include " || fd > MAX_FD_VALUE", but I don't know what defined symbol
to put in place of MAX_FD_VALUE, and I don't know its value off the
top of my head.

I hope this helps.

4068. Directory node descriptors and AHDI

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 17:02:41 UTC
From: MALCOLM@tower-vax.city-poly.ac.UK
Message-ID: <8912130812.AA24281@ucbvax.Berkeley.EDU>
Source record: 245842

Thanks to Allan Pratt for his clear description of the 40-folder bug and what TOS 1.4 does about it. No flame intended, but I think this is the first *real* description of the problem that I've seen. Which brings me to my question. When I disassembled AHDI (version 1.7 I think) I noticed that it contained identical pool-extension code to FOLDRXXX. So am I right in thinking that if AHDI extends the pool by a large enough number of directory node descriptors I can throw away FOLDRXXX? I could add code to AHDI to make the extnension variable (duplicating the functionality of the 'XXX' in 'FOLDRXXX').

4072. shel_put()

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 18:39:18 UTC
From: ignac@electro.UUCP
Message-ID: <1232@electro.UUCP>
Source record: 245846

i've got an interesting problem that's been driving me nuts over the last few days. i've written an accessory that uses the AES calls shel_get() and shel_put(). both calls work fine when i compile this program as a standard .PRG file (ie: run the program, get the AES environment using shel_get(), monkey around with it, and restore it using shel_put().)

when i compile it as an accessory, strange things begin to happen. firstly, if i run a gem application, say, tempus.prg, and go to the desk menu bar entry and choose my accessory, it does the usual shel_get(), then i change the AES environment, and save it normally using the shel_put() call. i exit tempus.prg (or whatever application i was using) and lo and behold, the changes i made while using my accessory in tempus.prg are visible back in the desktop.

fine and dandy. this is to be expected. but here comes the weird behaviour. when i'm in the desktop itself, and choose my accessory, do the shel_get(), it gets the current desktop info no problem. now, i change things around, (like the drive masks, etc) and save it using shel_put(). nothing changes at all. its as if the shel_put() call did not work, even though according to developer docs, shel_put() did NOT return an error condition. i call my accessory again, and sure enough, it shows the old information, not what i had edited.

according to the docs, there are NO restrictions on when and where you do the AES calls shel_get() and shel_put(). does the AES detect that you're in the desktop, and ignore shel_put() calls???? this is not pleasing to me since i want to be able to change drive masks, and other desktop.inf things that the desktop can't change itself from the desktop, but its not letting me.

what does atari's control panel do to change the desktop.inf parameters that it monkeys around with. i know that it at least does a shel_get call since a trap 2 monitor i tried once showed that shel_get was called. is there some secret communication protocol between control panel and the desktop to update the desktop.inf information?????

what's the scoop here ken? anything illegal i'm doing?? care to divulge the secrets behind control panel? (that's thirty million for the contol panel secret ...) (take off of the caramilk commercial!) :-)

(btw, the accessory i'm describing is the latest revision of the registered owner version of Quick Inf.

i might as well say that the Quick Utilities updates are now shipping, so come on people, get your disks in for your updates!)

```

I don't exactly know what is going on in your program. But I could see there are some logical errors in the control loop. First of all, you should wait for event keyboard and event message (MU_MESAG|MU_KEYBD) in the evnt_multi(). However, your code suggest that you wait for Mouse Rectange 2 and Keyboard because you pass in (MN_SELECTED|MU_KEYBD) which has a value of 11 instead of 17. MN_SELECTED should not be used at here.

After you regain control from the evnt_multi(), you need to check to see if the event is Message. If so, what kind of Message is it?

The code should look something like this:

```
menu_addr( menu, ON );

for( ; ; )
{
event = evnt_multi( MU_MESAG|MU_KEYBD,
0,0,0,
0,0,0,0,0,
0,0,0,0,0,
msg_buffer,
dummy,dummy,
&dummy,&dummy,
&dummy,&dummy,
&key,
&dummy
);

wind_update( TRUE ); /* block out everybody else */

if ( event & MU_KEYBD )
{
do sonething....
}
```

```
if ( event & MU_MESAG )
{
if ( msg_buf[0] == MN_SELECTED )/* menu is selected */
{
if ( msg_buf[3] == XXXXX ) /* check for which menu */
{
if ( msg_buf[4] == YYYYY ) /* check for which item */
{
do something ....
}
}
}
}

wind_update( FALSE );
}

menu_bar( menu, OFF );
appl_exit();
```

I hope this can help to clear up some of your confusions.
Good Luck!

4074. Re: GNU-C configuration info wanted

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 19:17:04 UTC
From: bobw@hpsad.HP.COM
Message-ID: <750036@hpsad.HP.COM>
Source record: 245848
Body handling: HTML body converted to readable text

>Has anybody put together a configuration of GCC running on an ST that
>works?

I'm attempting to setup a system to use GCC as well. You seem to be
a bit further than I, so I have no answers to your questions. I am
posting this to show that there are people out here trying to use the
GNU stuff and having trouble. Those in the know, please respond to
this basenote. My specific questions is below.

>My set-up is a Mega ST-4 with 68 meg of hard disk, TOS 1.2 and a Mono-monitor.
>I have FOLDR400.PRG in my auto directory, and I run gnu-make from under
>a modified MWC shell.
I have a 520ST w/2.5M and color screen, ICD Host Adaptor with 44M of disc
space. I'm using the Gulam shell.

I've been attempting to get gdb going but have not been able to get it
to allow me to debug at the source level.

I have to link in a second step after compiling because I don't have
gnugdb.olb. I don't want to get all the the gnu sources to compile my
own copy. Could someone please send me one?

A question about when using gdb. First what I'm doing.

```
>cc -c -gg hello.c
>sym-ld -r -o hello.sym c:\bin\gnu\lib\crt0.o
>cc hello.o -o hello.ttp

>gdb
(gdb) sym hello.sym

(gdb) exec hello.ttp
(gdb) run

(gdb) list
Listing source requires symbols.

(gdb) step
```

What do I need to do to have it step through and show me the source code?
I want to use gdb at the highest level, after all, I'm just learning this
stuff.

>Can anyone give me pointers, descriptions, how-to's or other advice?
Yes, please do this.

> Daniel A. Glasser

4076. A few questions on CAD 3D II and Cyber-animation

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 20:13:19 UTC
From: jalkio@cc.helsinki.fi
Message-ID: <1632.25855bdf@cc.helsinki.fi>
Source record: 245850

Can the CAD 3D II use more than 1 meg of memory? That is, can I use more and/or more complicated objects if I have over 1 MB of memory?

Is there some way to play Cyber-animations from Hard Disk? In that way I could have even 80 MB (or over) of continuous Cyber-animation. Is this possible?

Please, inform me because I am going to buy a hard disk and a memory upgrade.

4077. THANKS Dave Small for doing legal calls -- Adobe Type Manager

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 20:34:36 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891212.14343434.031382@SFA.CP6>
Source record: 245751

Hello all,

The fact that David Small's Spectre GCR is so very legal while doing calls is such a blessing. His emulator greatly extends the power of the Atari ST.
I have spent all morning using Adobe Type Manager on the Spectre GCR. This one package has stopped most of my thoughts of selling my HP DeskJet for a laser (in spite of slower speed, water soluable ink, etc.). Amazingly, the Spectre GCR can run Adobe Type Manager and very well, thank you.
With the Atari ST, Spectre GCR, HP DeskJet, and Adobe Type Manager, I just collected some nice Christmas money by preparing flyer masters using fonts that measure over 2 1/2" tall!!! The fonts for these monsters have absolutely NO jaggies. Nope, none at all.
Being the simpleton that I am, my needs are slight. I don't need Type 3 fonts and so forth. In fact, the fonts supplied by Adobe are more than adequate for my needs. Indeed, for $57.00 from Mac Zone software, I was able to get Adobe Type Master and fonts for TIMES, HELVETICA, COURIER, and SYMBOL.
And it all WORKS! The speed is not that bad either, whether we are talking about the printer or the screen. Of course, I am on a four megged MegaST, so that might make a difference.
More postive strokes... in the room with me, as I type, are several Macintoshers. They are seeing this ST running FullWrite (document processor--memory hog), RedRyder (terminal program that I'm typing on now), and StuffIt (an archive utility) all by way of MultiFinder. All of these programs are on-line, right now, on my ST as I type this letter.
Sorry about occuping net space and your time but experiences like this cause some enthusiasm and a need to share it with others, albeit all over the planet. THANKS to David Small for making this possible.

From: daroloson@watmath.waterloo.edu
Message-ID: <32556@watmath.waterloo.edu>
Source record: 245752

I mailed Mandarin concerning a bug with window titles containing blanks and they mailed me a disk labelled STOS 2.5 which seems to work on the new roms.

The STOS Club had the disk to update to 2.4 in its library so they might also have a new rom update.

Maybe someone in the UK could phone both of them and ask if the update is generally available and for how much.

Also, has anyone seen the new packages (Musician, Vidi, & 3D), the new book by Stephen Hill, the new gamespak, or any of the stuff from Shadow Software?

I host the STOS special interest group for KWEST (Kitchener-Waterloo Eight Sixteen Thirty-Two), have written 2 STOS columns for our newsletter "The Hard Copy", and am working on several incomplete projects so I would like to hear from other STOS Basic users.

>to Ken _are_ way off base. comp.sys.atari.st is by no means an accurate
>representation of all Atari end-users out there.

Don: Hello Randy, I am looking for a personal computer for use
at home. You know, games, a spreadsheet or two.

Randy: Well ....

Don: I thought I would ask you about which type of computer to buy,
you being a computer person, working for a great big company,
you guys must have all kinds of good information. What computer
do you have ?

Randy: I have an Atari ST Mega 2 and and older IBM.

Don: What kind of things can it do. Can it play games, talk to IBMs,
can my kid learn to program on it.

Randy: Well, to tell you the truth, its hard to program. Harddisks are
expensive because no one know how to build the silly things.
Public domain games are hard to find, as there are not too many
hackers. Programs are reasonable priced, but ...

Not realistic ? Why not ? I am a computer "person", I do not want to
program by Mega 2. But I do want to play around with it. I need reasonable
technical support, either from Atari or from the book store (like IBMs
provide). By not making it fun for us high end users, Atari is creating
a lot of bad press for itself.

Would I really say those things to Don. No. Would I lie to him. No. What he
will hear is what really is. Atari supports only professional developers !

4082. What's wrong with Atari Canada?

Newsgroup: comp.sys.atari.st
Date: 1989-12-12 23:42:07 UTC
From: johns@maccs.dcss.mcmaster.ca
Message-ID: <25858CCF.26616@maccs.dcss.mcmaster.ca>
Source record: 245756

Please don't read this as a flame. I am genuinely concerned about what is going on here in Canada at Atari.
Here in Hamilton we now have 3 computers stores that carry Atari, plus other music stores. I am in contact with 2 of the stores, and I get the picture that they cannot get any more 520s and 1040s. Haven't been able to for a few weeks now, since they sold out. And it's Christmas. Yet I hear (consistent) rumours about wharehouses chok full of STEs in Toronto. Two dealers each have an STE, as a demo, but can't get more. And they both tell me that they have the only one in Canada. Other sources say that there are 6 in showrooms across Canada. What's going on? Am I just putting too much stock in rumours? Please say yes.
Another story.
Some time during the summer, June or July, our club president made an appointment with someone at Atari Canada. They were going to come in and do a little show for us. Great! We put it in our newsletter, but not before confirming several times during the summer and the fall that they were actually going to show. Beginning of October, our prez calls one last time just before making final plans for November like this: 'We know it's your busy time of year, are you sure you can make it? We still have time to change plans.' Of course they would come.
Just 2 short measly weeks before the meeting, they cancelled. Even sent a note of apology. A little time before that they had gotten rid of all their sales staff. Why? You have to have salespeople to sell, right? Have I got the picture right? I'd like to think I'm mislead.
Does anyone @ atari, Allan, Ken, John, anyone, know anything? I'm curious.

Hi,

Last week I finally traded in my old machine and bought a brand new MEGA 2.
Now for the bad part: it resets on its self now and then (and continues to
do this until power is off), windows are destroyed, parts of windows use
to stay on the same place, although the window itself is moved and programs
tend to bomb (or windows within programs are destroyed).

Has anyone experienced this problems too?

>C:\AUTO as instructed in the docs.

This works for me. Are you sure the docs say to put icdboot.prg in the
AUTO folder on A:? When I want to boot from floppy, I don't care to
have access to the hard disc, so I don't have it on my A:. Holding C/S/A
will boot from the floppy, not holding will autoboot from the hard disc.

>I have tried all combinations of softboot/hardboot, wait till the floppy
>lite comes on and goes off, and so on as recommended in the ICD docs
>that I got with the kit...and all I get is the default ROM desktop.
>It doesn't autoboot from the hard-drive, but it doesn't read the floppy
>either, it just comes up with the ROM 2-icon desktop.

Have you saved a different desktop on your A:? Make sure your computer is
turned completely off. I've noticed funny stuff when touching the reset
button when Ihave the ICD hard driver stuff loaded. It seems to boot from
the hard disc much faster.

I notice that a number of US netters still think the ATW is vapourware, it is *NOT* I have seen many working machines. The ATW is very powerfull with great graphics but is of as expected expencive (exact cost eludes me.)

On to another subject the Stacy. A few people have asked for comments on the this machine. Firstly the back lit screen is easy to read although the screen update times are a little slow, and compaires well with the very expencive apple mac protable. Secondly on a lower note it is reported that the battery life is short... VERY short on hard drive modles. ST world have just done a full review if you require more details.

>of news rumoured before but now it seems to be fact. Can either Ken or
>Allan shed any light on this strange happening. ST Format suggested it was
>designed to get Commodore owners used to buying Atari, seems like a vague
>and dodgy idea to me.

I should first warn you that I don't know of any official confirmation
of the above (although I await it eagerly).

Although most of us in this newsgroup are pro-Atari (including me), I
don't really think we have to worry about Atari selling out by simply
writing Amiga software.

It's not that they wouldn't, but rather that it wouldn't be a problem
if they did. The Atari and the Amiga allready share a very commom
software pool. After all, the machines are quite similar in many respects.
If Atari writes some quality software (instead of a third party),
all the more power to them. Maybe we'll get some great new software
titles.. Maybe Atari will be successfull and make lotsa cash.. And
maybe they'll up competition in the market (that's always good for
improving quality products).

Let's not judge too hastily.

>
> The whole point was so I could boot from floppy on those rare occasions
> when I wanted to use a GDOS application. I have a stock 1040ST with
> TOS 1.4. Can anyone shed any light on this situation?

If I understand what you're saying, you have the hard drive normally autoboot (with ICDBOOT.SYS in C:\), but on occasion, you want to boot stuff from the floppy as well and still have it boot the hard drive.

I suggest you put ICDBOOT.PRG near the last file of the A:\AUTO folder. To do that, take everything out of it, and copy everything back, making sure that ICDBOOT.PRG is copied last, unless you have STARTGEM or something like that. (Or you could use something like AUTOSORT or CFJ's AUTO folder sorting utility to rearrange the files in AUTO.)

When the hard drive boots, hold down the CTRL/SHIFT/ALT keys. Right after you see the hard drive's light flicker and turn off, let go. This will let the files in A:\AUTO boot and then ICDBOOT.PRG will load after the rest of the files.

Although what would be easier is to put GDOS in C:\AUTO and get something like SUPER BOOT or DESK MANAGER to deselect GDOS when you don't want it to load.

Just one question in this discussion...

If Atari has such a low opinion of the "end users" who buy their machines, and can assume that 90% of them only want to run programs, not write them, why has Atari traditionally supplied a *programming language* with the computers..?

In fact, my ST came with *two* programming languages...

>registering as a developer is an all-or-nothing package?

Right now, Atari is in the middle of completely restructuring their developer support. It looks as if there will be a two-tiered structure, with professio developers receiving one level of support including tech support, hardware discounts, access to dealer and customer databases and software, and a second level for "shareware" developers who for a lower fee will receive a lower level of support.

To get the most accurate information, and to receive an application for developer status, call Charles Cherry at Atari Corp.

Note: this is a VERY positive development (no pun intended.. :) in the Atari world. If Atari comes through this time on what they're trying to do, it could mean a real change in Atari/developer relations...

4094. Chaos Strikes Back... Dungeon Master II

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 06:48:47 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <24963@cup.portal.com>
Source record: 245768

In case anyone hasn't heard, "Chaos Strikes Back", the sequel to Dungeon Mast is out...!

FTL has shipped the game to distributors, and it should be showing up at local dealers this week, if it hasn't already...

The game is a standalone game, which doesn't really require your owning the original Dungeon Master, even though the packaging indicates that DM is required.. (although.. if you haven't played through Dungeon Master, you're not likely to last long in this game..!)

There's a Character Editor which allows you to "customize" the little picture of each Champion, and in case you don't have a Saved Game disk from Dungeon Master with your favorite party on it, there's a selection of new Champions to choose from...

Be prepared though... this is one tough game..! The very FIRST room you appear in is *worse* than ANYTHING in the original Dungeon Master...!

(Ken Badertscher) writes:

>Honk! There's a program, SETENV or somesuch, which sets the
>environment up for the desktop, and hence for all of it's children. It
>can be useful for people (like me) who _like_ to use the Desktop.

I have one such program as well. It was posted here a while ago in asm
source form. Unfortunately, I wasn't able to get it to work with TOS 1.4.
I haven't found the time to figure out why.

Incidentally, since there is a "Move" command, and since the desktop now
preserves the file date/time entry, I have resumed to use the desktop.
I like it, too!

>And then there's the mythical DA environment setter I was working on
>which got mowed over by TT TOS for the time being...

OK, so I'll withhold my suggestions for TOS 1.8 until you're done with that
environment setter DA we're all waiting for. :-)

There was one available comercially, and it did a pretty good job.
Generally, you could take a functional ST BASIC program, run the
compiler on it, and have an identically executing (but much faster)
stand alone program. It also provided a testable variable which had
different values under the interpreter and the compiler for resolving the
few idiosyncracies that popped up. It was from Logical Design Works,
and called, reasonably, The ST BASIC Compiler. I don't know the
current status of it here in the USA, let alone down under.

4102. Atari Dealers

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 12:16:51 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Dec13.072851est.57406@ugw.utcs.utoronto.ca>
Source record: 245775

I guess things are better up here in Canada. I live in Toronto (pop. 2.x million) and I have four ST dealers in a fifteen-minute walk of my apartment, and several more within a half-hour drive. Two of the dealers near my apartment, Savetech and the Compustore, are as good as ST dealers could ever get, and push (and display) Atari computers above anything else. About 18 months ago, I was talking to a Timeworks rep. at a trade show, and he said that Timeworks sold more ST software in _Eastern_ Canada than in all of the US. Remember, the population of _all_ of Canada is less than a tenth that of the US. Even my little hometown, Kingston (pop. 60000) had a couple of ST dealers last I checked.

Just another light note: I was marking the final essays for my Business writing students. One student kept arguing that the best land surveyers were the ones who kept on the breaking edge of technology. The firm that he works for, in Cochrane (near James Bay!) used a mega 2 and some kind of surveying software to stay on that breaking edge!

Finally, the last nice thing about living to TO is having Atari Canada and ISD only a local call away, and being able to drive up to ISD (25 minutes) to get the newest Calamus upgrade or new fonts.

Before anyone packs up and moves to Toronto, though, remember that even though we have a clean city and a microscopic crime rate, we also have higher rents and a lower vacancy rate than NYC. Our baseball team always beats the shit out of the Yankees, though.

> extnension variable (duplicating the functionality of the 'XXX' in 'FOLDRXXX').

NO!

ahdi adds folders so that you can even load foldrxxx.prg (tos 1.0).
I learned this the hard way when trying to find why I had a tos1.4 problem
not on 1.0. I recompiled my ahdi clone without the folder fix and found
I could not open any files in the desktop. They had all been used in
getting there.
(Yes I'm sure the number of sub directories in c: affected my case.)

However, ahdi does not add enough for many applications.
FOLDRXXX.PRG allows you to take enough memory for your environment without
wasting too much memory.

The problem that we will have if we split comp.sys.atari up is the same problem that has occurred in the music groups.
Last year a proposal was made to form rec.music.cd so that people who wanted information about CD's could read and post there......well, can you guess what has happened ? Probably 95% of what is posted in rec.music.cd is also still posted in rec.music.misc which is the newsgroup that they were trying to get the CD stuff out of.

I really think that if you split comp.sys.atari.st you're just going to end up with 2 or 3 more newsgroups that contain crosspostings of the same information.

There is no problem in hooking up any monitor - providing it has a horizontal scan frequency of 35.7kHz. The IBM one is nowhere near this, nor are most cheap mono monitors. They are available, but won't be very cheap; at least as much as a genuine Atari one. If you have some electronics knowledge you can modify a monitor to work on the new frequency, but it's a fairly extensive modification and I wouldn't do it on one you've just bought. Alternatively you might prefer to design your own and build it from scratch if you like that sort of thing. Mono monitor circuitry is pretty rudimentary and quite fun to play with. But if you just want to use it - buy an SM124!

When I first ORDERED my 1040ST back in march of '86,
I never thought of buying programs. I was feverishly
reading forth and LISP and waiting anxiously for
my box to arrive at my dealer's. It didn't occur
to me that i would BUY software... i figured i was
buying a computer that would allow me to write
programs for myself. I was very fascinated with
the computer's potential and I wanted to learn how
to program the thing. Needless to say, I was shocked
at how little information was provided when I opened my
box.

I am certainly NOT the only "end-user" interested in
programming the ST.. virtually every person I know who has
purchased an ST (or any computer) has expressed a strong
interest in programming. I am talking about "end-users".
You don't have to have visions of developing commercial or
PD software to want to program the ST. I think it would
be a great benefit to the ATARI community if ATARI would
provide a much improved manual with their systems as well
as a package priced reasonably that could be purchased by
an "end-user" that would give a clear and accurate image

of what's inside the plastic casing.

First off, I agree, the manual that comes with the ST isn't all that great, but it is good enough to learn how to use the desktop (although several things are ommited). HOWEVER, when I compare this documentation to the documentation you get with one of them fruity computers, its not even close. Apple gives your more manuals than you know what to do with. BUT wait a minute! How come my the Mac costs so much more (something we ALL want to know!)? Good manuals? Maybe. So, would you be willing to spend another $50-$60 to get technical documentation? You should be, you would be paying ATLEAST that much more if you bought ANY other computer. And YOU CAN get ONLY the developer documentation, although I don't remember how much off hand. (Approx. $100) Hmm.. Sounds fair to me.. I know MANY people who WOULD NEVER use this documentation, and THEY would be unhappy if they were FORCED to pay for it. Just think of it as one of the few add ons you can get from Atari. ;-)

4113. VIRUS PREVENTION AND HELP FOR SPECTRE OWNERS

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 15:44:44 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891213.09444156.032840@SFA.CP6>
Source record: 245787

Hello all,

Start the New Year out right, protect your Spectre software from
virus infection. Yep, just like a real Mac, your ST can become infected
with real Mac virus critters. As a side note, the ST has unique ability
to become infected with ST, IBM, and Mac virus varmits, all due to the
wonders of emulation.
The following are available now from LISTSERV@RICE and the syntax
is for BitNet. You'll need help for FTP syntax and other net syntax
which I know absolutely nothing.

The following file names have a brief description. Syntax follows
afterwards:

virus-detective-31a -- Accessory. User configurable resource string
search.
disinfectant-14 -- Application. THE BEST. Searches for
virus and kills it.
gatekeeper-111 -- INIT/CDEV. Complex but is the best virus
preventive.

Keep Gatekeeper active during all sessions. Check your disks and
partitions religiously with Disinfectant. When a new virus arrives and
is announced on the nets, take the string information given and install
it on Virus Detective. Check your disks then with Virus Detective.
Disinfectant will normally be updated a few days later and sent to
the nets. Terrible cycle, isn't it? Now, aren't you glad that our OS
is in ROM? Though we have our share of virus events, they are nothing
like they are in the other computer worlds.
Virus Detective and Disinfectant are only a few days old at this
writing, that is, are the latest versions and have December dates. GateKeeper
has a September date and is due to be updated shortly. It is, however, the
BEST 'gatekeeper' in screening what is going on in your Spectre. It will
prevent the virus from entering. Disinfectant and Virus Detective can
only detect with Disinfectant being the only one able to clean things up.
Virus Detective can only clean out a new virus called WDEV. Clear as mud?
Don't worry, just use these three and you'll be in great shape.
Syntax listing:

$MACHARC GET virus/gatekeeper-111.hqx
$MACARCH GET virus/disinfectant-14.hqx
$MACARCH GET virus/virus-detective-31a.hqx

All three available at LISTSERV@RICE.
Special flash!!!!
This is non-virus related.... Do you like and use the UIS II or other

GEM file selector box programs? Do you wish the same can be had for your Spectre? Well, the following program can fulfill your wishes and MORE. This is the latest and was just released to the nets:

$MACARCH GET cdev/boomerang-20b9.hqx

This is a fantastic program and just like UIS II/III, something that should have been burned in the OS ROMs.
They keep coming in. Here is another "required" program for your ST Spectre. Just released... It is a replacement for the previous version. LAYOUT 1.9 will customize the fonts and placement for your desktop.

$MACARCH GET util/layout-19.hqx

These five programs would be a perfect stocking stuffer for the new Spectre GCR gift. Most have December release dates and will offer the ultimate virus protection and will give more versatility to your ST investment when running Spectre GCR.

After catching part of the messages going back and forth, please
tell me something.....
Why in the world are people using an SLM804 (or ANY laser printer)
with programs like Award Maker or the like? Laser Printers are
EXPENSIVE--- I got mine only because I can make a living off of it...
and only use professional software, such as PageStream, Calamus,
Illustrator, etc. Why in the world does one pay for a premium device
and then use Mickey Mouse software?
BTW, I can see using something like LaserBrain (unavailable in the
US) to replace the Diablo Emulator. The control panel locks up my
system sdo regularly that I can;t use it.

4115. Dungeon Master II

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 16:16:21 UTC
From: sandy47@ucsco.UCSC.EDU
Message-ID: <10027@saturn.ucsc.edu>
Source record: 245789

Just got "Chaos" and I am impressed! The folks at FTL have really outdone themselves this time. It was worth the wait, everyone.

I brought in my characters from a saved game from Dungeon Masters I (all are Master in all 4 categories) and have stayed alive for the first few minutes of play! I spent MANY hours building these guys up on level 4, so that they could survive.

You come in to the first room with no material objects from the saved DM I game, no weapons, no food, no flasks, NO ARMOR! There are, however, relatives of your friends from level 4 to greet you. Also there are many of the things you'll need to re-equip yourself within the first room.

Smoothest transition I've ever seen into a add-on package.

You MUST buy this one for Christmas, it is fantastic!

Larry

>Back in 1985-1986 when I was in Kentucky, I remember there was an awful lot
>of talk about using the MIDI port of the Atari ST for a LAN. I haven't
>read the newsgroup for a while, because it has too many items per day, but
>I reckon that if it can be done, then they should have worked it all out
>by now. 4 years should have been enough.

Every MIDI-LAN announcement that I saw back in those days turned to
vapor, but recently I saw an inexpensive LAN called SGS Net. One of the
local dealers has it in stock, and says it works. I have not tried it.

Here's a description, from memory (which may be faulty):

A server with a hard drive runs a program that monitors the MIDI line for
data requests. The server program runs in the background and the Atari ST
can be used more or less normally.

Each ST node runs a program that installs a virtual drive; all i/o
requests to that drive are redirected to the network.

File locking is supported. The documentation includes some C source
examples that may be useful in writing your own networking applications,
such as e-mail.

The physical connections require a MIDI cable that connects to a small
box. The box then plugs into a shielded coaxial cable that forms the
network's backbone. I don't know whether they have to be hooked up in a
ring, a string, or what. As I recall, it theoretically will allow you to
interconnect 32 computers, but you should kep in mind that the MIDI port
is not very fast by LAN standards.

The E. Arthur Brown Co., a mail-order firm in Alexandria, Minnesota, that
has a good reputation, lists the SGS Server/Node startup package at
$149.95 (U.S.). That package supports two machines, and includes software
and hardware. (You may have to supply your own coax; I don't remember.)
Each additional node is $99.95. E. Arthur Brown can be telephoned at

(612) 762-8847.

I have no connection with the above firms.

Although people seem to have loud ideas about what Atari should do,
I don't see many concrete suggestions in many of these postings...

In article <4905@blake.acs.washington.edu> ramsiri@blake.acs.washington.edu (Enartloc Nhoj) writes:

! I was very fascinated with the computer's potential and I wanted to
! learn how to program the thing. Needless to say, I was shocked at how
! little information was provided when I opened my box.

How many PC Clones or Amigas come with lots of programming info out of
the box? Macs? Every wonder why? Market surveys.

! I think it would
!be a great benefit to the ATARI community if ATARI would
!provide a much improved manual with their systems as well
!as a package priced reasonably that could be purchased by
!an "end-user" that would give a clear and accurate image
!of what's inside the plastic casing.

What don't you like about the current 3rd party books about
programming the ST? I don't think they're perfect, but they
were certainly good enough to let me write GEM applications.

I am looking for a source of the 13-pin Atari monitor connector. I know of one place in California which was selling them a couple of years ago, but they were not easy to use (the pins did not have solder cups to stick the wires into - just stubs which you could solder on the side of.)

I understand that this item is commonplace in Europe. If I can't find a good source of them in Canada or the U.S., I would even be willing to purchase them from abroad.

Any information would be appreciated.

I went to the Ontario Science Centre recently and by a fortunate
circumstance, there was a MIDI Show the day I went. Well, there were
STs EVERYWHERE, and this included two Stacys. I had the opportunity
to use one for nearly 30 minutes, running Notator and Calamus.

Both of the Stacys had backlit displays which I liked *VERY* much..
It's the best supertwist backlit screen I've seen to date, and is
very usable!! They were both Stacy 4's, with 4 megs of ram and
a built in 40 meg hard drive. One of the Atari (Canada) employees
at hand said that these were production run machines and we could expect
to see them in Canada before the end of the year. Unfortunately, I'm
not from Canada (close though.. :-)...

I would like to thank Robert from Netherlands and Darek from ATARI Corp.
for answering my question!

They both suggested to use wind_update() instead of menu_bar(), inside
the for-loop! So YES, that was the answer: once i did it, everything was
working fine! As far as MN_SELECTED is concerned, i have to apologise, but
i was using MU_MESAG from the very first time; i just mistyped the code
when i sent it to the net!

The sad thing is, that I've never seen wind_update() documented along
with any menu_xxxx() function! I'm using MWC's manual and "GEM Programer's
Reference" by Abacus, as GEM reference guides! In both of them, wind_update()
is NOT even MENTIONED on the pages talking about menus! But that's why Use-
Net does exist, i guess!

So, for any future GEM programer who wants to use keyboard equivalents, be
carefull when using menu_bar(menutree, 0/1). If you want to disable the
menu bar while you are in the main loop, use wind_update(BEG/END_UPDATE);
among other things it disables the menu bar too! I figured it out, in the
hard way, but I'm glad that people like Robert and Darek do exist and are
ready to help!

Thanks again!!

Harry Karayiannis
3rd Year Computer Science
Boston University

PS1: Ken, Alan and Darek prove every day, through this net, that ATARI Corp.
Programming Department consists of outstanding individuals! Imagine ST
Community's future (in the US) without those three men advising other
ST users and programmers! (I only wish ATARI could publish a complete
documentation on Technical Information about its machines, and make it
available to the public! All the books i've seen assume that the reader
is already familiar with GEM, and are used as refernce books! Only Pro-
spero Software provides exceptional documentation with its products
- I happen to own Prospero Pascal (but still,nothing about wind_update()
on menu pages) -)!

PS2: Ok Robert, I haven't forgotten you! In the past, i said that Germans are
ST wizards! I did forget to add Netherland guys too! Actually, in the
middle Europe one can get the most out of his ST, and Netherlans is in
the middle Europe, right? BTH, I love the Netherland version of the game
RISK!

Take care guys!!!!

>computers..?
>
>In fact, my ST came with *two* programming languages...
>
>BobR

Bob,
It seems to me that supplying a language like Basic fits exactly into the type of support that Atari is capable of providing at the moment -- they'll supply a language to everyone if they don't need to tell them what they're doing wrong when they get bugs using it. Anyone can go out and buy a Basic book and figure it out themselves.

Keep in mind that Atari is a _small_ company, the programmers that you see on the net are a _sizable_ portion of their entire programming staff. We all work really hard to give people support, but we've got jobs to do also, and don't read news all day. Atari _has_ a technical support person, for developers, but then again, resources are limited.

Now, you're gonna say "why doesn't Atari release all their documentation instead of hiding it, then people would stop clamouring about support." Unfortunately, this ain't true. The more people have documentation from Atari, the more they feel that they can ask Atari about problems with their programs. The staff required to support a book like DE RE ATARI is HUGE, GIGANTIC, and was nice at the time, but the Tramiel's Atari doesn't run on that kinda $$.

You _can_ get all the documentation you need to write fine Atari GEM based programs out of MWC's manual, or books like "Programming the Atari ST", which is a fine book... And I like to use the "Programmer's Guide to GEM", although it's also fraught with frustrating translations between IBM and Atari world GEMs, and some things that are just plain wrong. If you want, you can grab the Atari developer's docs for about $100 (last I checked, don't quote me on it ;-)). That's a fine reference manual, as long as you're used to 'man' pages... ;-).

Woah, been on a soapbox for a little there...
Um, ok, seriously, I know the end user's gonna buy the ST for a little programming work, but the moment they start thinking about _real_ programming, they should go out and buy a good C compiler (or pick your

favorite language). Is it _really_ the job of Atari to supply the end user with the language(s) and documentation for the price they charge you for the computer? Ok, I don't think so. I think it's _perfectly reasonable_ to charge for that kind of software and docs, which you'll note, Apple does too ;-). It's a service, just like anything else in the computer world, and you're gonna have to pay. Developers _do_ get discounts on hardware... They _do_ have someone to call when they've got problems... You gotta pay.

Atari doesn't have a low opinion of the end user, it has simply reduced what it ships with the machine to what it deems is the lowest common denominator among the buyers of the machine -- what _everyone_ is gonna find useful. Thus the prices remain low, and you get something neato. If you want more, ok, you'll have to buy it, but _what_ you buy is now up to _you_, and not Atari. They don't spend your money _for_ you.

My opinions are my OWN, _not_ necessarily Atari's. But "hey", who knows?

4123. ATM on the Spectre GCR continued...

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 18:25:50 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891213.12254953.033065@SFA.CP6>
Source record: 245797

Sorry folks,

...but I'm getting a lot of bounced mail. The following letter and
my reply to him may be of benefit to others, though...

Thanks for the info on Adobe Type Manager and Spectre.

I was wondering what printer driver you use and how that ties
in to ATM? I use the Grappler LS driver under Spectre to drive
my deskjet, and it comes with a set of fonts called G-Dutch and
G-Swiss. I get 300-dpi fonts (no jaggies), because the Grappler Driver
uses the 4x version of the screen font to print to the Deskjet (e.g.,
the 12-point screen font is printed using the corresponding 48-point
font).

Would ATM make my printer driver unnecessary? Thanks for any info,

Rana Dutt
rcd@mtqua.att.com

Rana,

I've a feeling that Grappler LS drivers may have a fit with ATM,
but I have not tested the Grappler program yet. The reason that I say
that is because Grappler LS does not support PostScript, so they say.
ATM still requires a printer driver. The one that I really like
is from DataPak. I don't know its price, though.
I understand that there are several PD/shareware drivers
out there. I believe that they are listed in Dave Small's newsletter.
At LISTSERV@RICE, there are two files which are in the domain:

DESKJET-DRIVER and DESKJET-DRIVER-MANUAL.

To get these type:

$MACARCH GET UTIL/DESKJET-DRIVER.HQX
$MACARCH GET UTIL/DESKJET-DRIVER-MANUAL.HQX

I have found that the smaller fonts are cleaner than Grappler's.
Also, you can save a lot of disk space with ATM. All you need are the
10 and 12 points of the font family to get sizes up to whatever. I'm
able to use 100 point with no problem at all.
Installation is not particularly clear via the manual (sound
familiar?). Basically, you merely install the outline fonts in
your System Folder (generous samples are on the ATM disk) and install
ATM's bitmap fonts into the System program.

ATM claims that if you already have bitmapped fonts of the same name as that supplied by ATM, that you don't need to replace those. However, my bitmapped fonts were really huge in space since they went above 12 point in size. ATM only needs a maximum of 12 point to give you beautiful type so I swapped fonts.
Obviously, if you are using a large font for a utility, such as SuperClock, then you'd want to keep that point size. I've found that utilities will not access ATM. ATM is only used via document processors. Also, no skewing of characters, or character rotation is supported by ATM.
Be sure to read on the net all the corrections that other users will be making of my letter! I'm sure that I've goofed up somewhere in trying to explain all of this. At any rate, ATM is a great addition to the Spectre GCR. I love it.
Even at a list price of $99.00, it is a great program.

Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

Sorry if this sounds stupid, I was a little bleary when I thought it up... Folks were talking about the intricacies of producing legal Mac/BIOS ROM clones. 2 programming teams, one to analyze the existing code and document it, one to reimplement according to team 1's specs.

I don't care for Macintoshes or PCs very much. I'd really like to see some detailed TOS docs though, and this sounds like the ideal approach to getting it. Original source code from Atari would be pretty cool, but they don't even give that to registered developers any more. (Much to my chagrin, $300 after the fact, y'know? }-) How 'bout a team of ST programmers getting together to analyze TOS 1.4, and publish their specs? That ought to be at least as useful as the original source code, and doesn't require any effort on Atari's part. Ideally the Atari system programmers themselves would be best suited to the task, being most familiar with everything, but they're already pretty busy. And, I suppose, being so thoroughly familiar with the code, they may overlook mentioning some things that they take for granted. It would be a lot of grungy work to explore the ROMs from a total outsider's viewpoint, but it would be useful...

I'm not particularly interested in cloning TOS ROMs. i don't have the desire (or the resources!) to produce ST clones. But I *would* like to have enough docs to write my own mods to TOS. I can't see this being a bad thing, look at all the info you can get about MSDOS, and look at the sophistication of most DOS programs...

A number of people have mentioned GNU C, and C++. Along those lines,
is there some sort of source code control system (a la SCCS on Suns) which
is available for the ST, so that I can do source code control? I write
a great deal of code, and it would be nice to have some sort of serious
source code control system, as opposed to just backing up the old copy
of the source to an alternate directory in my makefile.

I wrote a program in laser C which is highly interactive, and I would
like to print the output of the program. If I simply redirect the output
I can't see it, and if I don't, I can't save it.

I have gulam and Pcommand. Does anyone know how to make the program
redirect the output but still show it on the screen?
One common way some shells do it is by turning on a "log file"
which logs all input and output, and this would be the ideal
solution. Does anyone know if either Gulam or Pcommand supports
this, and if so, how to use it?

4128. help with dlibs

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 21:34:06 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <1868@calvin.cs.mcgill.ca>
Source record: 245702

I am a novice user of computers and compilers, and just downloaded
dlibs12 from terminator.
I placed the header files in e:\dlibs\h,
and everything else in e:\dlibs

Now I want laser C to use these libraries instead of the default ones.

I went into the environment variables and changed all the ones
I thought I was supposed to.

clib=e:\dlibs\dlib.a
cinit=e:\dlibs\dstart.o
cinclude=e:\dlibs\h\

and I also tried changing libpath to e:\dlibs\

And now when I try to compile/link a program, the linker says

undefinined symbol: __lmul

I don't even know what lmul is, but anyway... What else do I need to
do in order to get laserc working with dlibs?

4129. Futher Adventures of ATM & Spectre

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 22:30:06 UTC
From: mjv@iris.brown.edu
Message-ID: <22827@brunix.UUCP>
Source record: 245703

My continuing plunge into the ATM world has netted (pun not intended)
these further comments, suggestions, and intangables.

Let me state my system again: MegaST2 (2megs), ICD host adapter,
65 meg RLL HD (Seagate 277R), external SF314 drive which will read
Mac disks while the internal won't but that's another posting, running
Spectre GCR 2.3, System 6.0.2 (no multifinder, and sound turned off)
and Epstart Epson printer driver 2.5 with a Star NX-10 printer.

I finally did some printouts to see how they looked. This included
some good and bad news. First the bad (jeez, I'm mean).
On some printouts, especially low point size, the descenders of letters
such as 'g' or 'p' were cut a little. It turns out that you have a
trade off to choose. After finally consulting the manual (tryed to put
that one off as much as I could to act like a normal mac user), I
found out that you can either have ATM cut a bit off the descenders and
have your line spacing retained or vice versa (full descenders as opposed
to untrue line spacing.) The clipping might not happen on higher
resolution printers (300dpi DeskJet, etc..) since it has more room to
print. It did happen on my Star NX (which is a 9-pin) but it wasn't
that bad. Noticable, but not an eye sore.
The good news is that large point sizes come out fantastic. I printed
out "Atari ST" in 4 different fonts, landscape mode, at 127 point size
from MacDraw2. It took around 12 minutes to finish (mind you it is also
converting the ImageWriter to Epson codes, that's the Epstart overhead,
your mileage will vary). People were hard pressed to believe that the
print out was from a 9-pin. At a casual look, people thought that it
was laser printed. Not bad at all. Of course the smaller one gets,
especially around 20 pts and less, people start to notice the jaggies
but are generally very impressed. I did another print out of a document
with three sentences all with varying multiple styles and point sizes (all
were under 25 pts though.) That one took around 4 minutes. The Pagemaker
3.0 document of medium complexity took around 8 mintues. Not bad.

There has been recent gripping about the manuals that one gets with the
ST's but those are wonderful technical manuals when compared to the ATM's
manual. It basically covers installation and recites much from Apple's
own manuals as to how to do things. Its repeatative at that too. It has
a large Q/A section in that back (the whole manual is about 30 pgs!)
which goes to show you how many problems that expected people to have with
it. Virtually no technical info as to how it works. The most informative
info is in the Q/A section (an extra card with Q/A's was also added) and
the read me file. I was very disappointed with the manual. It makes one
really appreciate the time that David Small puts into his manuals. His
are the only manuals that I have gone back and read because they were

fun.

Here comes another ATM oddity (actually its more like font oddity in general). When you normally select a font and choose a style for it, let's say bold for example, for screen display the Mac will do some QuickDraw fattening of the font to make it look bold. It is however, not a true bold font. If you have ever taken a look at the list of fonts from a PostScript printer you will notice fonts such as _Times roman_, _Times Bold_, _Times BoldItalic, and _Times Italic_. Each one is in fact a seperate font (you can derive outline and shadow from those.) Now when you select bold the normal mac way we've all gotten used to, ATM intercepts in and calculates it. The result is a rather ugly looking change to the font you are using. It also appears to be as 'light' as the plain style of the font. The print out will come out bold however. To get a true, nice looking bold screen font, you must install the font called 'Times Bold' for example. If you were to use italics then you'd install 'Times Italic' etc... This starts to suck up disk space and makes you font menu look like a mess. You don't have to install those screen fonts to get them to print out correctly, you can just keep their outline fonts installed in the System folder and ATM will try to make decent looking screen version (bold is the worst looking) but if you want true screen to printer look, then you should install those extra screen fonts/styles. Its all up to your tolerances.

And finally, Adobe Type Manager costs $99 and that comes with Times, Helvetica, Symbol, and Courier. The Plus font pack costs $198 for a limited time and that gets you all the other fonts that are in the LaserWriter Plus. ATM only works with System 6 or later and those who have only 1 meg should seriously think twice before getting it (I'd recommend not to if you have 1 meg.) Those withOUT 128K roms can't use it because of the System 6 barrier.

Congradulations for making through my message, you have lots of patience. All comments, questions, or rants about how much money my message cost you can be directed to the address below. Enjoy!

Unfortunately, since we can't use Type 3 fonts for the time being, we are locked into buying Adobe and LinoType Type 1 fonts which are very expensive$$$! The Type 3's are much cheaper (though of less quality) but you can find them in the PD are from small font houses for $25.
I'm glad everythings working out great. Ain't Dave too incredible sometimes.

There have been several posts about mono games recently and I thought
I'd add this info in. It seems that at least recent Sierra On-Line games
will work in mono. I've been playing Manhunter: New York and both
color and mono and notice no difference in speed or quality of game.
Their fake menu bar sure does look small in mono though. I'd check
to make sure which SOL games work in mono first but I'd bet you'll have
good luck.

Additionally :

You can get back into text mode (without the RESET) by using one of the
ALT + FUNCTION-KEY sequences to "Enter TEXT mode". While I cannot remember
which one it is now, pressing the <HELP> key will get you to the screen
where the screen display shows you the FKEY settings.

4134. Facts, not only talking about them.

Newsgroup: comp.sys.atari.st
Date: 1989-12-13 23:55:49 UTC
From: qralph@dna.lth.se
Message-ID: <1989Dec13.235549.4778@lth.se>
Source record: 245708

Hi,
I have spent, wasted, countless of milliseconds reading the flames, and
also the comments from Ken (even sent him an e-mail or two one late night,
but that's only a week or two ago so no reply yet). Instead of telling why
facts shouldn't be distributed in a crisp form on this net I think it would
be SHORTER to tell them! Like this, as an example:

New registers in the 1040STE.
From an article by Martin Backschat in ST Magazin, December 1989.
Translated by Ralph Haglund, QRALPH@SELDC51, qralph@dna.lth.se.

FF8204 ....xxxxxx VCOUNTHI (R/W)
FF8206 ....xxxxxxxx VCOUNTMID (R/W)
FF8208 ....xxxxxxx. VCOUNTLO (R/W)

The Video Address Counter is now read and write. A write
effects immediately, thus be careful and use it preferably
during the VBL interrupt.

FF820C ....xxxxxxx. VBASELO (R/W)

This register contains the low byte of the screen base
address. It allows you to set the screen on a word
(earlier only on a 256-byte block) to get vertical
scrolling.

FF820E ....xxxxxxxx LINEWID (R/W)

Contain the offset to the next line. The value is the
number of words that is added at the end of the screen
line to get to the new line. When value = 0 (happens
at reset) it works like on a ST. This allows panning of
a wider image than can be seen on the screen.
Ex: Write the value 20, giving, in 640x400 mode an image
640+20x16 = 960 pixels wide. To see column 20 to 670 you
increase the screen base address with one (16 bits) and
put a 4 in HSCROLL.

FF8240- red grn blu
FF825E ....032103210321 PALETTE (R/W)

Palette register, now 4 bits for each colour. Observe
that the least significant bit is placed highest, to
retain compatibility with ST.

FF8264 ....xxxx HSCROLL (R/W)

This register makes horizontal bitwise scrolling possible.
The value tells at which bit of the screen address VBASE
the screen will start.

fire button
FF9200 ....3210 FIRE0-3 (R)
joy3 1 2 0
FF9202 udlrudlrudlrudlr JOY0-3 (R/W)

Via the fire and joy registers you inquire about the two
old (joy1 and joy3) and new (joy0 and joy2). You can also
write to joy0 and joy2.

FF9210 ....xxxxxxxx XPAD0 (R)
FF9212 ....xxxxxxxx YPAD0 (R)
FF9214 ....xxxxxxxx XPAD1 (R)
FF9216 ....xxxxxxxx YPAD1 (R)

You can put a pair of paddles in joystick port 0
(paddle 0) and another pair in joystick port 2 (paddle 1).
The registers contain the position. The fire buttons are
the same as for joysticks. The trigger for the paddles is
in bit 0 and 1 of the register FF9202 (right, left of joy0).

FF9220 ......xxxxxxxxxx LIGHTX (R)
FF9222 ......xxxxxxxxxx LIGHTY (R)

Light gun/pen. This can be put in joy0. The registers
contain the position. The x position changes every
4 pixels in 320x200 mode
8 640x200
16 640x400

The y resolution is exact. The x position is always shown
in 320x200 resolution, thus for 640x200 you shift one bit
to the left and for 640x400 two bits.

FF8900 ....xcc SDMACNTR (R/W)

Sound-DMA control register.
cc = 00 - sound DMA switched off (after reset)
cc = 01 - sound DMA on; off at frame end
cc = 10 - sound DMA on; repeat each frame
This last value can be used for more complex sounds. Here
timer-A of the MFP in event count mode gets a signal at
end of frame. If you set the data register in timer-A in
event count mode to 5, the music frame will be repeated
5 times.
In the interrupt routine the FRMBASE can be changed, as
the old value is buffered - a new value can be written in
FRMBASE while the old frame is played. In this way double
buffering can be utilized.

```
FF8902 ..........xxxxxx FRMBASEHI (R/W)
FF8904 ........xxxxxxxx FRMBASEMID (R/W)
FF8906 ........xxxxxxx. FRMBASELO (R/W)

Frame base address. Base address of the music frame.

FF8908 ..........xxxxxx FRMCNTHI (R)
FF890A ........xxxxxxxx FRMCNTMID (R)
FF890C ........xxxxxxx. FRMCNTLO (R)

Frame address counter. The actual address of the
sound DMA. This way you can find out what sample
is momentarily played.

FF890E ..........xxxxxx FRMENDHI (R/W)
FF8910 ........xxxxxxxx FRMENDMID (R/W)
FF8912 ........xxxxxxx. FRMENDLO (R/E)

End address of the music frame.

FF8920 ........m.....rr SMODCNTR (R/W)

Sound mode control. Frequency and mode for playing
the frame.
rr = 00 - 6258 Hz frequency (default)
rr = 01 - 12517
rr = 10 - 25033
rr = 11 - 50066
m = 0 - stereo (default)
m = 1 - mono
The frequency is for mono, half the value for stereo.
Each sample is 8 bit, -128 to +127. In stereo, every
second byte is for left, every second for right channel.

FF8922 xxxxxxxxxxxxxxxx MWDATA (R/E)
FF8924 xxxxxxxxxxxxxxxx MWMASK (R/W)

The microwire interface for future microwire devices.
Already integrated is the LMC1992 computer, that is
responsible for the sound and volume of the digital sound.
The LMC1992 has device address 01.
To program the LMC1992 you must always set the mask register
to $07FF. The control you write to the data register:
xx 01 011 DDD DDD : set main volume
000 000 - -80 dB
010 100 - -40 dB
101 000 - 0 dB

xx 01 101 XDD DDD : volume of left channel
00 000 - -40 dB
01 010 - -20 dB (2 dB steps)
10 100 - 0 dB

xx 01 100 XDD DDD : volume of right channel
00 000 - -40 dB
```

01 010 - -20 dB (2 dB steps)
10 100 - 0 dB

xx 01 010 XXD DDD : set treble
0 000 - -12 dB
0 110 - 0 dB (2 dB steps)
1 100 - +12 dB

xx 01 001 XXD DDD : set bass
0 000 - -12 dB
0 110 - 0 dB (2 dB steps)
1 100 - +12 dB

xx 01 000 XXX XDD : define mixing
00 - -12 dB
01 - mix with GI soundchip
10 - don't mix with GI soundchip
11 - reserved

Just as for the TT, the old ROM address has moved from $FC0000
to $E00000. The ROMs are 256 Kbytes, with ca 30 Kbytes free.
The functions Setpalette and Setcolor are changed to adapt to
4-bit colors. All trap-F accesses to AES are gone. The internal
variables have also changed addresses.

$$$

That is a better way to use the bandwith IMHO.
Another way to learn facts is to subscribe on the two main German
ST magazines. I have done so for two years and for sure improved my
German! Let's take the December issues, here is a quick resume of
their contents:

ST Computer, Dec. 1989
Some stuff in this issue:
New software for the PC emulator PC-Speed: runs Hercules resolution,
and also support for Extended Memory Specification.
New 16MHz accelerator with 16k cache, compatible with 68881 etc. 798DM
Test of hard disks.
BioNet 100 - Ethernet for Atari ST.
Info about TOS030, like resolutions, new XBIOS calls:
XBIOS 66: DMA/SCSI communication
XBIOS 80: Set screen mode/resolution
XBIOS 81: Get d:op
XBIOS 82: Get/set screen mode only
XBIOS 83: Get/set color
XBIOS 84: Set range of colors from palette
XBIOS 85: Get d:o
XBIOS 86: Get/set bit 4 of resolution register
XBIOS 87: Get/set bit 7 of resolution register
And quite a bit more about the TT.

Encryption systems.
Details about AES and VDI in TOS 1.4
Part 11(I think) of a Modula-2 course.
Numerical Math, part 4, diff. equations of 1st order.
Submenus under GEM
Details about loading from diskettes as fast as possible.
Pictures in one of the PD TeX systems offered.
More about that same TeX system.
4 pages of game tests, of 198 pages in all.

December issue of ST Magazine contains, among other things:
Sprite animation program in Gfa Basic (on the diskette you can buy for DM20)
Info from TOS 1.4 release notes.
Homemade SCSI - hardware article.
New registers in STE.
New file functions in TOS 1.4
3D surfaces in net graphics.
Reference pages for Omikron Assembler/Debugger
Part 3 or 4 of how to use Calamus.
How to use resource files in Gfa Basic.
4-5 pages of game tests, 158 pages in all.

Reason to start learning German???

$$$

4135. Re: Mega chips & drive questions

Is there any way to petition some sort of hierarchical notes guru or something, or some sort of moderator that can be mailed to in order to eject somebody from a notesfile. I'm not sure what the process is to get into newsgroups (my college account gives me automatic access), but it seems there could be some method by which a renewal of a subsctiption to notes could be refused. There seem to be some people out there who think this notesfile is a good place to throw tantrums and that the notesfile was created for their personal use (i.e. nobody else on the net matters, It's ME, ME, ME!).
Is there no way to push these selfish, irritating, repetitive, boring, etc... people off of the net (I don't want to mention any names) ? Or can a heckler destroy the notesfile of his choice by posting it full of useless messages at will ?

A curious notesfile reader

Frankly, I think inclusive speech is stupid. If women are so unsure of their worth that they can't accept tradition, then use female speech. When you are trying to get facts conveyed (gee, is that what English docs are trying to do), it seems sort of silly to keep putting he/she or "he or she" into the document. By using female speech, I mean just say "She engineered the computer" instead of "He...". Even though the percentage of female students in engineering is extremely low in the U.S., and this would be less accurate, I think I could accept this. I'd rather not have to even think about it, though. By tradition, "he" usually means "he or she" anyways.

P.S. On a side note, I think that the traditions destoyed by equal rights movements have had a substantial negative effect on our country. Wives aren't home with the kids anymore, people are sleeping together instead of getting married and settling down (it used to be common for women to take care of the childen, but "professional' women don't have time for this). There used to be a job for the male of nearly every family, now there are some families with the husband and wife working (kids getting ignored) and others where neither can get a job. I could continue on to discuss delinquency of children, and future repercussion, but this is the WRONG notesfile for political statements. I welcome flaming hot mail at rjk752@uxf.cso.uiuc.edu

4137. Pagestream 1.8 users - help requested

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 01:04:50 UTC
From: art@maccs.dcss.mcmaster.ca
Message-ID: <2586F1B2.18997@maccs.dcss.mcmaster.ca>
Source record: 245711

I've recently gotten Pagestream 1.8 and a Megafile 30 to put it on. Before this we used Pagestream 1.52 on a single floppy 1040. Our printer is an Apple LaserWriter plus.

However I have been unable to get anything other than a simple small document (like "hello world" in the middle of the page) to print. The manual additions enclosed (on disk) do not print.

originally I loaded up everything onto the hard disk. All programs, all printer drivers, All fonts - the included fonts plus about 10 others that we got for use with 1.52 - our dealer said the fonts are compatible.

I called softlogik support, they suggested that maybe memory was cluttered up too much. So i emtptied all desk accessories save the control panel. Also dumped all auto progs save FOLDR100, NITE15 and MOUSEDOUBLER. I freed up as much memory as our other 1040 (the one without the megafile 30) has. I dumped all printer drivers save the PSCRIPT one, I even chopped out all fonts but the distribution fonts. Still no dice.

I'd like to hear from anyone else with the same configuration as us - 1040 (1 meg) , Megafile 30, Apple Laserwriter, Pagesrteam 1.8 - have you gotten yours to work?

In article <875@lzaz.ATT.COM> hcj@lzaz.ATT.COM (HC Johnson) writes:
>you can have char *fred[] = "hello";
>
>but not
>char fred[] = "hello";

Mr. Johnson is correct; to use the second form you must use the form
static char fred[] = "HELLO"
or the way he has it set up as an array of pointers (sometimes). If
you set it up as an array of pointers it will only work if the machine
uses a linear address scheme.

As this is not gauranteed in the standards, It could break if ported
to another machine or different compiler.

The point is to beware of utilizing side effects when writing code. The next
operating system release or compiler change CAN and OFTEN DOES wreak havock
with your programs.

For those who have not seen it yet, the newsgroup "comp.unix.wizards" is
very helpful for those just starting in C and unix. They are always eager
to lend support. The newsgroup seems to be not so much for the wizards as
it is for the neophytes who don't have a wizard handy to help them.

4143. more on strncpy (was re: laser c question)

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 02:16:10 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <1870@calvin.cs.mcgill.ca>
Source record: 245717

Here is a private letter I wanted to send but it got bounced,
but I realize it should be posted publicly for some of its
content anyway.

>>> DATA
<<< 554 <john%stag.UUCP%uunet.UUCP%dynasoft@Larry.McRCIM.McGill.EDU>... Remote protocol
error: Bad file number
554 john%stag.UUCP%uunet.UUCP%dynasoft@Larry.McRCIM.McGill.EDU... Service unavailable

[In message "Re: laser C question" on Dec 13, John Stanley writes:]
: [in my message I wrote:]
: > Since there is no mem.h library of routines, I use strncpy to copy the
: > contents of one-dimensional arrays.
:
: Since strncpy doesn't copy <n> bytes but rather <n> bytes OR until it
: finds the 1st null (zero) byte in the array, using strncpy to replace
: blkcpy or memcpy isn't going to work. If it has worked so-far, it's only
: because Laser C uses an incorrect implementation of strncpy or because
: you've been Very-Very lucky....

no, actually. This little fact was something I knew a little while ago
but totally forgot about until two days ago, while I was agonizing over
the strangest bug for four damned hours and finally found it after
exhausting every other goddamned possibility... Too bad your letter didn't
come two days earlier, but that's not your fault :-)..

: Moving one, two, or fifty dimensional arrays is all the same to C.
: It's just a destination address, a source address, and the number of
: bytes to move...

: I can send you one that's written for Alcyon/Sozobon C in assembly.
: It's quite fast but you'd probably have to modify it a little to be
: compatable with Lazer C. I could also send you a similar block-move
: function written entirely in C (it just wouldn't be quite-as-fast).

someone already sent me dlibs memcpy which I believe is what is used
in Sozobon.... However, I don't have an assembler and am not too
much of an expert in it anyway, so I couldn't get it installed on
my system without help.

: Alternately, does Lazer C allow copying structures using a simple
: assignment? <struct2> = <struct1>; If so, what I've ocassionaly used in
: situations like yours is to define a struct containing the array and
: moved copys of the array arround by just using assignments...

that's a good idea. I should try it. I didn't think it was possible though,
as struct names are just pointers to memory locations of data, just

like arrays, and you can address the 5th byte of a structure with
*(structname+5) just like arrays.

in reply to my using strncpy for multidimension arrays not working,

: Why won't it? Ignoring for the moment that strncpy isn't a blkcpy or
: memcpy, what's wrong with specifiying &array[0][0] as the address and
: using the size of the entire array (assuming it's smaller than 64k bytes)
: as the length?

I think I tried it and got a compiler error.. I could be mistaken, but
I passed it just

array

instead of

&(array[0][0])
since I thought the two were equivalent pointers...

: I'm trying... What you wrote makes it sound like you've been making
: some bad guesses so far so it may take a bit of work to get your program
: working the way you want it to... What are you writing anyway?

you are exactly right. However, I got it working now via the brute-force
loop-of-assign statements. If I can get dlibs installed properly on
Laser C (and I am having trouble, as you will soon see in one of
my messages posted on c-s-a-st which I posted today), I will then
translate them all into memcpy's.

: .. although, it would be a real-good-idea if you posted a note on the
: net mentioning that strncpy doesn't move <n> bytes so other beginning
: programmers who see your message won't think that it's a correct
: substitution....

ok.. I shall. Thanks for your help/reply!!

4144. realloc() - standard unix opperation is what?

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 02:16:40 UTC
From: achowe@tiger.waterloo.edu
Message-ID: <19281@watdragon.waterloo.edu>
Source record: 245718

I'm making use of realloc() from the Dale's dlibs. However I wonder how close this function is to a standard unix site. In Dale's version if <addr> is NULL then a malloc is done. If <size> is zero then a free is done. Else resized and possibly moved block of memory. NULL may be returned is the block can not be resized.

Now the man page for realloc() here at U(W) does not say anything except that the block is resized and possibly moved and that NULL may be returned if the resize fails.

What is the standard action realloc should take on when passed a NULL address or a size of zero?

In particular the issue of size zero. Does a unix realloc() free or size down to zero?

4146. Scrolling in GnuEmacs 18.51 on the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 03:53:50 UTC
From: sto9719@ultb.isc.rit.edu
Message-ID: <1756@ultb.isc.rit.edu>
Source record: 245720

Has anyone else had a problem with the scrolling that Gnuemacs 18.51 does on the Atari ST. The problem I have found is that when the screen scrolls, the status bar also moves and gives the appearance of an a window shade. Does anyone have an idea what this might be. Some said something about the termcap I am using.

Thanks for help in advance.

> is NOT even MENTIONED on the pages talking about menus! But that's why Use-
> Net does exist, i guess!
>

The MWC manual is less than clear in its example of using the menu bar (page 324). It has the event loop in main(), so it must turn off the menu bar from within the switch-case before calling appl_exit() and exit(). As a result, it would be easy to jump to the conclusion (as you did) that you need to turn off the menu bar with "menu_bar(menu,0)" before you do something. You don't, of course. You probably should set the menu entry to normal, but don't erase the bar.

MWC documents wind_update() as "an AES routine that locks or unlocks a window." In "Atari ST Application Programming" (Pollack and Weber, Bantam Books), wind_update() is documented as "communicate with the AES about the application's current processing," which is more general and more accurate.

The term "window" in this context is confusing, because you tend to think of a window as the classic visual object with a title bar, sliders, check boxes, etc. Actually, the work area is a window, and wind_update() in this context simply tells the Screen Manager not to mess with anything until you're finished.

> ... (I only wish ATARI could publish a complete
> documentation on Technical Information about its machines, and make it
> available to the public! All the books i've seen assume that the reader
> is already familiar with GEM, and are used as refernce books!

This is precisely the problem: You need a tutorial, and what you have are reference works. The aforementioned Pollack and Weber book is a fairly

gentle tutorial introduction to GEM programming. Your local bookseller should be able to order it, or you can get it direct from Bantam Books Inc., 666 Fifth Avenue, New York, NY 10103. The book's ISBN number is 0-553-34397-1. The copy I have says it's $24.95 US / $29.95 CDN.

4150. IBM PC XEROX VENTURA OR PAGEMAKER ON ATARI ST + PC DITTO + HP IIp

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 06:12:49 UTC
From: ia4@cunixd.cc.columbia.edu
Message-ID: <2452@cunixc.cc.columbia.edu>
Source record: 245724

Hi. Sorry if this has been covered before.

Many thanks to folks who have directly answered my previous queries and to net friends like Mr. Covert whose postings have been a great help. But a few questions remain unanswered. Hope YOU can help :-)

My "project" is to "publish" a report/thesis in the form of a book using an ATARI ST (Mega 2 hopefully as soon as my 1040 is sold) and a Laserprinter. This will be a mostly text project with some layout graphics but not much of "clip art" or photos I think.

I am told Calamus with a mono monitor and HP Laserjet will do the job.
Q. Does Calamus REQUIRE a Hard Drive? Is Atari Megafile 30 OK?

I was hoping to use Xerox Ventura or Pagemaker for the PC under the software version of PC Dito when I do get the hard drive. Reason: so my files could be used on someone else's IBM PC also.
Q. Is this possible? I guess it will be SLOOOOW but will it work? Suggestions?

Q. How much can I get Calamus for? Any chance to see it run on COlor STs?

I am in urgent need of this help and would really appreciate your cooperation.

Thanks

Imran Anwar

4151. looking for some case tools

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 06:37:24 UTC
From: johna@van-bc.UUCP
Message-ID: <95@van-bc.UUCP>
Source record: 245725
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc,alt.msdos.programmer,misc.wanted,comp.sources.wanted,alt.sources.wanted

This is my first attempt at cross posting, I hope it actually
got where I wanted it to.

Has anybody seen programs similar to DEC's CASE tools "program
coverage analyzer" and "program test-bed analyzer" or even a
version of the p.d. program "calls" that is not tied to pipes?
C source code is preferred, since these would be running on
several different machines.

For those that don't know, the first two packages scan through
your code and make sure that every test/branch/function call
in that code is exercised. They allow you to build a minimal
set of test bed input data that runs through every possible part
of your code (even parts that you didn't know existed). When
you add extra features to your code, you can verify that all the
old data still makes it through, and figure out exactly what
other data must be added to the input to verify the new parts.

Think of them as advanced code profilers that supply quick
feedback on how data flows through your code, allowing you to
find that one-in-a-million bug that was in code never tested,
and add new features without adding new bugs, since you can
re-test using all your old data and quickly generate new data
that tests only the new code.

If nothing like this exists, and somebody thinks it would be a
fun project, a good place to start might be with the source to
cpr, calls, profile, and the C interpreter in chapter 1 of
Herbert Schildt's book "Born to Code in C".

Please reply by mail, I hope the path given below is correct.
(assuming of course that a .signature was included)

John

From: R_Tim_Coslet@cup.portal.com
Message-ID: <25010@cup.portal.com>
Source record: 245726

Well, I just installed the _2_Chip_ TOS 1.4 in my MEGA ST2.
======

Came right up no problems, installed NeoDesk still no problems...

Tried several of my usual programs (one acted a little strange, but
I will have to look into it further, I wrote part of it and might be
doing something slightly illegal with AES that TOS 1.2 didn't mind but
TOS 1.4 won't tolerate).

Then I encountered a PROBLEM with UniTerm V2.0c...

... it gives 3 BOMBS on exit!!!!!

Trying an old copy of UniTerm V2.0a, it also BOMBS on exit (2 BOMBS this time)!

Other than this (BOMBS on exit) UniTerm seems to work fine under TOS 1.4.
Has anyone else encountered problems like this with UniTerm (any version)
under TOS 1.4?

>the original Dungeon Master, even though the packaging indicates that DM is
>required.. (although.. if you haven't played through Dungeon Master, you're
>not likely to last long in this game..!)
I think what they meant was that Knowledge of DM is required - specifically how to use spells. There is no word on how to actually play Chaos Strikes Back, beyond 'works very much like the original Dungeon Master...' and other mostly cryptic (to someone who's never played the original DM) similarities.
>
>Be prepared though... this is one tough game..! The very FIRST room you
>appear in is *worse* than ANYTHING in the original Dungeon Master...!
>
I wouldn't call that room as tough as level 12. Those fire creatures are mean. Is it my imagination, or do these 'improved' worms have nastier poison?

Bob, have you found the secret entrance yet? I'm being very cautious about this game. I've heard that each invocation of NEW ADVENTURE creates another random dungeon, so mapping does no good party to other party. Haven't tried it yet though.

Some of those new characters look cool - the Incan party, the Bird characters, the Insects. I like what they did to Wuuf...

I own a copy of PIE (Professional Icon Editor) It's a great program and it does what was mentioned, but it is awfully slow to boot up with it; especially if your booting up with floppies. You would have to put a desk accesory and data file on every disk you wanted to boot up with the new icons.

I bought mine a few years ago; it is put out by Antic and I have not seen it since. If anyone is interested, I'll sell my disk and documentation. I've only used it once, it's too much of a pain on a floppy system. I'll let it go for $10.00 plus shipping.

Oh, brother -- I suppose that means I'd better hurry up & finish DM! ;-)

Okay, I admit it; I'm stuck! It's been a while since I've played, but I'd like to dust off my party & finish up. I've gotten the fire-staff, defeated the guardian of the power gem (or whatever it's called -- like I said, it's been awhile), "charged" the staff, and, and, and -- I can't figure out how to get rid of / tame / cage the Dark Lord. I suppose the answer's right under my nose, but I don't feel like scratching around for it anymore. Can someone give me a spoiler? Pretty please?

Naaaw, you didn't have any goof-up's. I just want to add some little points in.

> ATM claims that if you already have bitmapped fonts of the same
> name as that supplied by ATM, that you don't need to replace those.
> However, my bitmapped fonts were really huge in space since they
> went above 12 point in size. ATM only needs a maximum of 12 point
> to give you beautiful type so I swapped fonts.

With ATM, you can produce fonts as large as 8000+ pts or 255 times the size of your largest bitmap font. If you have a 12 point font then you can get produce 3060 pt. size font. I doubt you'll run into this barrier soon. I would suggest keeping the small point sizes installed in the system size they don't take up much room and they look so much nicer than what ATM can produce.

> Obviously, if you are using a large font for a utility, such
> as SuperClock, then you'd want to keep that point size. I've found
> that utilities will not access ATM. ATM is only used via document
> processors.

Probably since they're not getting the font info the 'legal' way. Since ATM only looks at one place to intercept the font calls, if the utility by-passes, then no go.

> Also, no skewing of characters, or character rotation
> is supported by ATM.

I have an ad right here for a program that supposedly does some of that. Its called _Type Align_ by Emerald City Software (list $99). It says that its a DA that lets you draw lines and then type text in. The text will then map to that line. Its written for use with ATM, or so the claim in ad goes. This ad is in MacWeek, December 5.

There is a new virus out infecting Macs these days called the WDEF virus. Some of its effects are crashing after choosing Save from some programs (such as Word...), crashing MacIIci's and Portables (will it crash a Spectred ST? I don't know), and slowing down AppleShare servers. The WDEF virus hides itself in the invisible DESKTOP file that is on every Mac disk. As soon as you put in an infected disk into your system, your DESKTOP file will be infected. It spreads very fast. You should check every disk you have (that includes HD partitions), since it can have horrible results but is easy to get rid of. If you are uneasy about using ResEdit (you can do horrible things to your system with it) then do try one of the other suggested cures.

Here are 3 ways of finding it and killing it.

Virus Detective 3.1: Add the following line to the list of checks:
Creator=ERIK & Resource WDEF & Any
Select the single file search and choose the DESKTOP file from the root level of your disk. If it does match then select remove. Under multifinder, I recieved an error but it did erase the fake virus. If you want to be safe, be in single finder mode and check for the virus while running any application, since you won't have the Desktop file open when you make changes.

ResEdit: Launch the program and open the DESKTOP file. Scroll down the resource to see if there is one called WDEF. Open the WDEF resource. If it comes up with an ID=0 (that's zero) then you have the real virus. To kill the virus, just select the WDEF resource and select CLEAR from the edit menu. Save the changes.

"I Don't Have Those Programs": You can get rid of the virus by rebuilding the Desktop. When you insert a disk (or mount a HD partition) if you hold down the Alt-Cntrl keys (Option-Command on the Mac) you will get a dialog box asking if you want to rebuild the desktop. Click on OK. The disk will be busy for awhile. If you had a virus on the disk, it won't tell you, butthe WDEF will be killed. Do take note that rebuilding the desktop gets rid of all the text that is in the Get Info boxes.

We have just found the virus in the public Mac clusters here at Brown U.,
so this virus is for real.

Sorry, Craig, the Amiga was developed on Sun workstations. In fact, the origninal Amiga DOS manuals make several references to porting code from the Sun.

The designer of the A1000's custom chips (whose name escapes me at the moment) also designed the ANTIC, CTIA, and PIA chips on the orignial Atari 800.

Good luck with finals. If yours are the hell mine are, I can sympathize.

[in all of this, the use of "static" is optional.]

char *fred = "Hello";
is valid C practice.

char *fred = "Hello";

is IDENTICAL to

char fred[] = "Hello";

Either way, "fred" points to an array of char's.
If your compiler does not handle this properly, then your "compiler"
should be replaced with a REAL C compiler. (1/2 :-)

with the declaration char *fred[], (this is the same as char **fred;)
"fred" point to an array of pointers to POINTERS to characters. This should
NEVER be defined like: 'char *fred[] = "Hello"; '

>
>Now the man page for realloc() here at U(W) does not say anything
>except that the block is resized and possibly moved and that NULL
>may be returned if the resize fails.
>

Dale's version is in accord with the interpretation of the draft ANSI
standard described in "C: A Reference Manual," Harbison and Steele, Tartan
Laboratories (Prentice-Hall), second edition.

```
char *realloc(ptr,size)
char *ptr;
unsigned size;
```

"If the first argument to realloc is a null pointer then the function
behaves like malloc .... if ptr is not null and size is zero, realloc
returns a null pointer and the old region is deallocated."

I recommend the book. It's the "other C bible," along with K&R.

Ummm, no. One declares and initializes a pointer, the other declares and initializes an array of characters. For a discussion see K&R, second edition, pp. 104 & 219. In particular, fred[0] = 'h' or *fred = 'h' is legal for the second declaration but not for the first (according to ANSI), while fred = "Goodbye" is legal for the first but not for the second.

The original posting in this thread referred to initialization of an _automatic_ array. This was forbidden by the original K&R but is permitted by ANSI C. See K&R, second edition, p. 219.

> something about the termcap I am using.
>

Yes indeed this has to do with the termcap entry. The emacs display routines
were designed to minimize the traffic of bytes over a serial line from the
computer to the actual display device (a terminal). Therefore emacs thinks that
sending an escape sequence of two characters to delete/insert a line is
faster than sending say 40 bytes of blank characters to delete the data
displayed in this line. This may be true for a terminal, but on the st with
it's graphic screen, the former operation could take some more time.

The termcap-database format has a method to say how "expensive" an operation
may be: the amount of padding needed. So all you have to do is to say emacs,
that either the operations add line (al) and delete line (dl) are very
expensive (you can specify eg. "al=80*\EL:dl=80*\EM" in your termcap entry),
or you can ommit those features, so that emacs will no longer use them.

But a word of warning: emacs uses this padding information (the number before
the '*') for calculating the cost of the operation and then tries the cheapest
way to reach its goal. Other programs may think, that the terminal needs
80-times the time as required to send the escape sequence to perform the actual
operation. To do something while "waiting for the terminal to complete the
operation", they may then decide to send some NUL-characters to the screen
(those would be ignored by normal terminals). As a consequence the program will
slow down even more - the st has to process those padding bytes too :-).

****
* BTW: *
****
I have a new (dumpable) version (18.55) ready. The dumped emacs has a
size of 520 kB (360 kB packed) and leaves about 110 kB free on a 1MB ST (i
would recommend using at least 2 MB - personally i use it with a 800 kB
RAM-disk on my Mega ST2). It has (among other improvements):
- mouse support
- Interrupts (via ^G or ^Z) at any time (eg during loading of files)
- suspend-emacs works with gulam too
- shell-mode works (well at least with Master)
- filenames of backup-files adapted to the st-limitations
If there is enough interest, i could post temacs (that's the raw, undumped
version), the standard-lisp-files and my postprocessor to relocate the image.

The termcap problem above remains the same (it's inherent to the display routines).

>> I can not get the Word Writer paragraph format command to work. Does any
>> know how to make it work
>> Gregory Gibson

++ I think that all blank spaces (ASCII 32) gets converted to ASCII character
++ 30. There is a ASCII character 30 before every newline (ASCII 10). And
++ the end of a paragraph has no ASCII 30 before the newline.
++ Mark Lehmann

<< If you type carriage return, that marks the end of the paragraph. Just type
<< in your text without hitting carriage return and let Word Writer break the
<< lines for you.
<< Michael Fischer |

Thank you for your help. I have a 2 part solution that can be implemented
within Word Writer.

1. Use the Word Write substitue command to replace ASCII blanks
with ASCII character 30.
ASCII blanks can be created using the space bar.
ASCII character 30 can be created using the 3 keys control shift 6.

2. Use the space bar to add a blank to the end of each line to be reformated.
This will put an ASCII charater 30 at the end of those lines. It might
be possible to do this by using the Word Writter substitute command to replace
control L with control L control shift 6.

Explanation:
After I loaded a Word Writer doc file into micro-emacs, I notice the formatable
paragraphs had ^^ instead of blanks and also had a ^^ at the end of each line.
Shitf 6 is ^. Control ^ creates an ASCII character 30. In micro-emacs,
control shift 6 appears as ^^. The rest is history.

Source record: 245657

For some rather complicated reasons I need to change system resolution
without using the Bios, Xbios, etc. This code MUST be legal for ALL
versions of TOS from now til the end of time.

I can get the _screen_ to change rez, but I can't get AES, etc.
to fully recognize the change. I managed to set bit planes correctly
by changing the line A variable at base + 0, but it's still
confused about the width of the screen in text columns, etc.

Does anybody know what Line A variables I need to change to do this?
Is there an offical Atari-sanctioned, guaranteed-not-to-break-ever
way of pulling this off?

(Please post replies to the net as it would be interesting to finally
see a techincal discussion on this newsgroup intsead of flames!)

Thanks,
Dave Baggett

These seemed so easy, I couldn't wait.

Here's a quick tee.c source for capturing it's stdin, logging it to a
file and writing it to stdout. I haven't tried it with my st, but
it works on my HP 360 HP-UX machine.

/******
*
* tee.c: log stdin to a file and write it to stdout
*
* Bob Waltenspiel 12/14/89
*
*****/

#include <stdio.h>

#define MAXLINE 500

main(argc, argv)
int argc; char *argv[];
{
FILE *fp;
char *str[MAXLINE];

if ( argc == 1 ) {
printf("tee: must specify log file.\n");
exit(1);
} else if (argc == 2) {
if ( (fp = fopen(argv[1], "w")) == NULL ) {
printf("tee: cannot open %s for writing.\n", argv[1]);
exit(1);
}
} else if (argc == 3) {
if ( (fp = fopen(argv[2], "a")) == NULL ) {
printf("tee: cannot open %s for writing.\n", argv[2]);
exit(1);
}
}

while ( fgets(str, MAXLINE, stdin) != NULL ) {
printf("%s", str);
fputs(str, fp);
}
exit(0);
```

```
}
```

>Has anyone else encountered problems like this with UniTerm (any version)
>under TOS 1.4?

I've noticed this problem with UniTerm V2.0e, and I don't think it is specific to TOS 1.4. UniTerm works fine when started from the desktop, but when started from the Mark Williams shell, it will give bombs on exiting, and sometimes the computer will subsequently crash. These bombs seem to occur with other programs compiled with OSS Pascal as well. I suspect the Pascal libraries are doing something incorrect with AES causing it to walk over memory that doesn't belong to it, and the particular memory that ends up getting trampled may well be different under TOS 1.4 than under previous versions, causing the change in behavior that you observe. You may find that it also depends on what TSR programs and desk accessories you have installed.

I'd be interested if anyone ever manages to track this problem down.

4188. HP Paintjet color printing

Newsgroup: comp.sys.atari.st
Date: 1989-12-14 22:27:41 UTC
From: rcd@cbnewsj.ATT.COM
Message-ID: <2859@cbnewsj.ATT.COM>
Source record: 245662

I'm considering the HP Paintjet for color printing from my ST.

Here are some details on the Paintjet:

RESOLUTION - can print up to 7 colors at 180 dpi
can print up to 330 colors at 90 dpi
prints text at 180 dpi

SPEED - 167 chars/sec text; graphics printing should take about 4 to 8 minutes
per page depending on various factors

Impressive, all in all, for a street price of about $990.

Now, some questions.
- Is there a Paintjet printer driver for Degas or Spectrum 512 format files?
- Is there a GDOS printer driver for it?
- Has anyone tried the Pagestream Paintjet driver from Softlogik?

Thanks.

If making money is not the goal of Atari Corp., I am very sure Atari will give you that as well. Would you expect a user who just wants a computer to do non-programming tasks to pay for the extra costs?

Please, memory map and interrupt vector address, etc have no bussiness in a user manual.

What all these documentations crap really comes down to the fact that Atari hasn't been publish a decent "Atari ST Programming Manual", and they did promise (not sure legally commited to it though). I don't know if Atari Corp. still sells the documentation-only Developer Package, maybe this may stop some of these amateur programmers moaning.

Hello Keith. I don't know about the rec groups as we don't get those
guys/gails here. What I orginally proposed is that ComP.sys.atari.st
be split into one or two unmoderated groups, and that a moderated
group be started.

The purpose of the moderated group would be that controlled postings
of quality get posted there. Maybe they get cross posted. Maybe not.
In any case, these quality postings would be archived and available
via FTP and mail servers.

When I say quality, I don't mean professional. I am referring to stuff
like "How to build A Hard Drive", "How to attach Track Ball to ST",
"How to upgrade 512 to 2.5 Megs". We all see these questions
posted to the net. We all see the answers constructed with great pain by
people in the know. What we don't see is their wisdom saved anyplace.

Under my scheme, many of these questions would be answered via a
mail message to a server, or an FTP session. Is this not better then
the current system ?

What I wonder is why my orginal posting has created so little responce,
three mail messages (two positive, one negative), and to follow-ups.
Don't people care ?

I had problems with Uniterm and NeoDesk. My problems related to having
TRANSWRP.PRG in my auto folder. For some reason, if I loaded TRANSWRP.PRG,
Uniterm would bomb when exiting back to NeoDesk. This also happened from
1st Word when exiting back to NeoDesk, if I had TRANSWRP.PRG loaded.
Included on the NeoDesk disk is a program call SHEL_FIX.PRG. It might
fix your problems. According to the documentation with SHEL_FIX.PRG,
some of the usual TOS functions concerning shells don't like be used
anywhere except from the real desktop. This program intercepts calls
to these functions. It was written by Dan Wilga, I think. Permission
is given to pass it around so long as it isn't modified, and the documentation
is included. If you need a copy, let me know.

> --
> S. Alan Ezust depeche@calvin.cs.mcgill.ca
> McGill University Department of Computer Science - Montreal, Quebec, Canada

DISCLAIMER: I haven't tried to make dLibs work with Laser C, and it may
not work at all since it was designed to work with Alcyon C and Sozobon C.

The problem appears to be one of not finding a function which is probably
a reference internally generated by the compiler. This one is most likely
the 'long multiply' function. In Alcyon/Sozobon the name of this function
is 'lmul' (note: NO leading underscore, this is in assembly code) and it,
along with others like 'ldiv', 'lmod', etc. are in the "math.s" source file.
You MAY be able to get dLibs working with Laser C by putting two underscores
in front of the global identifiers in "math.s" and re-assembling that source.
The compiler makes reference to these function when it need to multiply,
divide, modulo a long or unsigned long value, since these operations are
not directly supported by the 68000. The names used to call these functions
vary by compiler and are supplied with the compiler's normal libraries.
If you have a library manager, you may be able to extract the appropriate
functions from the Laser C library and combine then with dLibs, or simply
link with dLibs first, then with the default library to resolve any other
```

dependencies. Good luck.

Sorry Jim :-)

The computer system actually used for the original Amiga development
was a 68000-based Sage computer.

An Atari 800 was used only for emulating a simple raster display.

Jay Miner and a couple of the other Amiga chip designers were from
the OLD Atari company.

Several of the early Amiga guys worked at Epyx on their "secret
project", which we now know today as the Lynx.

Greg Lindahl asks:

>What don't you like about the current 3rd party books about
>programming the ST? I don't think they're perfect, but they
>were certainly good enough to let me write GEM applications.

Most of the third party books about the ST were "reverse engineered" and based on information that was discovered by disassembling code from the machine, or by experimentation, or I suspect from "illicit" passing on of information from registered developers.

Much of it was translated (in many cases very poorly) from German, and much of it contained bugs, misinformation and outright errors.

If Atari Corp is concerned, as KenB mentioned, about people passing on bugs, misinformation and outright errors, why doesn't *Atari* publish the "right stuff" and be sure it's passed on correctly?

Actually I agree with Ken Soohoo about the languages supplied by Atari with the ST... my Atari 800 didn't come with anything at all.. the BASIC cartridge was an option, so it was a nice surprise to have both ST BASIC and LOGO supplied with the machine. (Not that they ever got much use, but it was nice anyway...)

The point is though, that I think (my opinion, based on long experience of contact with a wide range of Atari owners) that most computer owners DO want to learn to do some programming. By supplying the languages with the machines, Atari seems to be recognizing that fact (and actually the manuals that came with ST BASIC and LOGO were surprisingly complete and well written.. they weren't some quick hack, just thrown together as a "freebie")

In actual fact, probably most of those "programmers" won't go very far, and will end up becoming "users", but at least they'll have the feeling of having learned to do something original with their expensive new toys..

Those that want to continue though, should have a good, "official" source of information to proceed. The third-party books are good, but I'd much rather have an official document from the manufacturer to go by. My Atari "Technical Reference Notes" for my Atari 800 were probably the most used set of documentation I had, and I think I have just about EVERY book ever written by anyone on the 800.

Actually, much of this discussion is moot though, as Atari seems to be workin right now on providing a way for "non-professional" programmers to have acces to this kind of support. It's a really encouraging move, and I hope it ends up benefitting both the Atari owners who want to get more out of their machines without "going Pro", and Atari Corp themselves...

The figure of 130 Atari dealers came from an Atari dealer. With all the dealers either going out of business or dropping the Atari line, I don't think that's too far out of line. Remember that the sales figures were for LAST year, and there's been another years worth of deterioration of the Atari marketplace since then.

You only have to read the postings here on UseNet, on the major information services and on local BBSs all over the US to see evidence of the situation. There are entire states without a single Atari dealer (and of course, Atari has stopped mail order sales of STs). People wanting to buy Atari equipment keep posting messages asking for help finding a dealer within hundreds of miles of them. It's not uncommon to read about someone driving 200 miles to get TOS 1.4 installed...

At any rate, we should be able to see the actual figures for ourselves soon if Atari follows through on some of the things they're recently been saying they're going to do. It used to be that when a third-party developer called and asked for a list of Atari dealers, they'd be told "NO" in no uncertain terms... it was "proprietary information", but it looks as if they're actually going to be releasing this information as part of their new developers' support.

Now if only they can get a more accurate listing of who actually sells Atari computers than they seem to have now...

The new golden worms seem to be about the same as those on level 4 of DM I, though their poison seems to wear off with time. I haven't been able to find any flasks for poison antidotes as yet.

I dropped through a trap and into a corridor with an alter at the end, as I turn either cw or ccw I see a total of four altars. One has a sword and is marked "ku", one has a yew staff (light) and is marked "dain", one is marked "ros" and has a set of poison darts, and the last one has a horn of fear and is marked "neta". I assume that these are the entrances to the 4 maze sections. Going down any path to the altar closes the wall behind you.

I went down the "ku" path and found myself dealing with some floating lobsters which have about the hitting power of spiders, yet there are more of them! You are only a corridor length away from an altar to bring back your skeletons.

Warning on the wall says "No Fireballs" and means it! They are turned back on you immediately. I ran into some knights that make DM I knights seem like they were already dead. And all my team is master in all 4 categories.

You don't need to have DM I to play this, but you definitely need the knowledge and the saved team (with lots of attributes).

Where is the water?

Larry

About Atari creating a software company to sell to other systems, look at it this way.

For example, SuperBeta still is the best 1/2" format (without going to a hi-res format, that goes to ED Beta), but Sony thought (I'm being very speculative, and simplistic, but it makes sense) if we can make money selling the other format, why not?

So, if Atari can make money selling programs to other systems, why not? Atari has the rights to games, for example, that would sell to other systems, like Qix, Food Fight (a favorite) and two I'd love to see for the ST, Ball Blazer and Rescue on Fractalus (A real time fractal generating space adventure.

About a year and a half ago, I worked at a sacramento, CA Atari dealer (since gone under) and I remember this interesting kit we had, but never sold.

It was a 2Mb expansion kit, by Atari, that apparently plugged into the expansion slot, and makes your Mega 2 into a Mega 4. I asked once, if this 2Mb board could be plugged into a Mega 4 to make it a Mega 6, but due to the OS, it was a no go.

Can anyone at Atari confirm if this kit is still available? The computer store where I worked was an authorized Atari Business Computer dealer, and we sold the entire line of STs, from 520 STs to Mega 4s, and printers from the SMM804 to the SLM804.

Ref: DISKPARAM
Hi Roger,
I have been trying to get the DISKPARAM myself. At one time Larry Rymal kindly sent it through BITNET to me but I was unable to 'BINHEX' it out. Apparently, Larry's computer system truncate some character while he was uploading.

Last month I received my SPECTRE GCR from Gadgets by Small. Dave includes a MAC PD disk with Spectre GCR. DISKPARAM is among other useful PD program in this disk. It is rather far away for me to send it to you (exactly 1/2 round the world). You may try asking Larry, or Dave Small. Another way to get this progra m is to order from the CURRENT NOTE PD library. Besides this program there is another PD Program called 'BIND ICON' which I still looking for. It is avail- able on GEnie but I can't afford the long distant phone bill to subscribe to US BBS. |
This is because Epson 24 pin printers are NOT FULLY compatible with 9 pin
printer. They are missing (at least) ONE escape command: esc 1 which set
line spacing to 7/72 inch and this command is used by the desktop. So you
can't print with alt-help on 24 pin printer except if you have a
print-screen driver replacement. I have not such auto prg.

Hear hear!
(BEGIN :-)
I believe that Apple were working on clones of these before they got Landon
and that IBM managed to get a prototype running but he has a segment size
problem.
Makes me wish we were US registered developers instead of UK forgotten ones.
1 * Atari(US) = 10 * Atari(UK)
And hey 'no fair' Atari(US), you got Richard Miller from us so how about
giving us someone back.
(END :-)

Seriously though ...
Update on the UK Developers Support:-
Acting on a tipoff that Atari UK were selling TOS 1.4 on EPROM, I phoned
them up. The phone answerer was either someone new or had been told to
shape up her act. I got through to Bob Katz right away (amazing eh!).
I asked him about chipsets and he said they were avaiable from sales and
that I should hurry as there were only 3 sets left.
I then pressed him about updated documentation and he said that I would get
that too. I have sent him four letters since July and asked about TOS1.4 in
all of them but he never told me it was available by letter,fax or phone.
I now understand that they have been selling chipsets to any TD|H who asked for
one, not just developers!

So I ordered a chipset. I phoned later to chase it up and they don't know
what I'm talking about. The 3 sets are gone too! There is a head shaped dent
in my wall now. I dunno, what's a guy to do? You can be sure I'll post any
new developments.

Right that's enough soapbox exercise for today ...

Re Atari Canada:

Non est qualis erat when Julius was there, but Atari Canada is still very good. I know of at least one Atari distributor who far prefers Atari Canada over Atari US. I don't know if they are as good for end-user support as they were with Julius, though.

Your dealer probably cannot get any 520 STs because Atari is planning to discontinue them, and make the 1040s the low-end ST (so I have heard, and it makes a lot of sense). The STEs probably are still awaiting CSA approval -- they had to remould one part of the Stacey (hence the delay until January). As for the 1040s, who knows? Any other comments?

4214. The 'BBC Micro'

Newsgroup: comp.sys.atari.st
Date: 1989-12-15 13:47:51 UTC
From: chaz_heritage.WGC1RX@XEROX.COM
Message-ID: <891215-054835-6506@Xerox>
Source record: 245688

In his Mon, 11 Dec 89 17:28:50 the Masked Rat Fink writes:

>I don't know whether you non-British folks have heard of the BBC Micro manufactured by Acorn (of Archimedies fame!) but this came supplied with one
of the best manuals that I have ever seen for a micro computer. It had loads
of system information....<[remainder of testimonial deleted]

This eight-bit computer was (and still is, God help us) one of the worst deals ever. It cost(s) roughly twice as much as any sensible competition, and achieved its position because its 'manufacturers', Acorn* (whose CEO was not above brawling in bars with the likes of 'Sir' Clive Sinclair) persuaded the BBC and the UK Government to grant them a licence to print money by standardising the machine for the state education system (in which, incidentally, since it is both obsolete and fundamentally incompatible with everything, it has retarded British computer education by an amount that can only be guessed at).

>My point is that if that much information can be supplied for a machine that
was in its day what the ST is now, why was no technical information supplied
with the ST?<

Technical publications, particularly for computers, cost a lot of money. You paid double what your BBC Micro was worth to get them. You paid what your ST hardware was worth without them, and didn't get them. You want blood with it, or what?

If you want posh manuals for your 68000 WIMP-enivronment machine, you should perhaps have bought a Mac, the outrageous price of which presumably includes them (plus Steve 'Big' Jobs' coke money).

Alternatively, buy books like 'The Second Manual for the Atari ST' which are a great deal cheaper than most computer books and provide a lot of useful information. The Abacus publications (which I don't have myself) also look pretty good. My guess is that you could provide yourself with most of what you need for less than what you would have had to pay Atari to do it for you.

Regards,

Chaz
(Computer Technical Author, among my other crimes)

* Acorn do not in fact manufacture this machine, or the (equally bad value) Archimedes; they have it done for them. This is another English irregular verb:

I make mutually profitatble OEM contracts;
YOU do badge-engineering;
THEY can't manufacture their own product....

4215. Paper Jams in Laser Printer

Newsgroup: comp.sys.atari.st

From: chaz_heritage.WGC1RX@XEROX.COM
Message-ID: <891215-061933-6565@Xerox>
Source record: 245689

In his Tue, 12 Dec 1989 11:04 EST Donald Simmons writes:

>...ever since we got the [SLM804] laser printer, we have had problems with the paper constantly jamming inside it. We have tried using different type of paper, but it seemed to have little effect. <

I don't have direct experience of the SLM804, but I do have some of xerographic machines in general - copiers and laser printers are similar in this respect.

The conditions in which the paper is stored can be critical. In the paper feeding system the rigidity of the paper often determines whether or not it feeds correctly. Paper which has been stored on its edge, or in damp conditions, often causes jams.

Try storing the paper flat on a high shelf (the air tends to be warmer and drier near the ceiling). Always load paper the right way up - good-quality paper has an arrow marked on the ream sleeve to show which way up it goes. Always circulate stock of paper and don't use old stock.

Hope this helps.

Regards,

Chaz

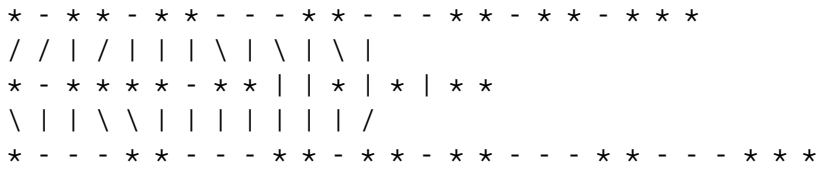
Next bulletin from Sozobon. Any Arkenoids wizards on the net?
Please respond directly to Hans (if still troubles then you may
mail to me).
mj@myrias.COM
>>>>>>>>>>>>>>>>>>> cut here >>>>>>>>>>>>>>>>>>>

There is a bug in all versions of 'hcc' that can occur when register
variables are declared in nested blocks. Because of it, 'jas' cannot
be re-compiled with the 1.2 release with the optimizer (-O) turned on.

In the file "fun.c", in the function "block()", change these 2 lines:

```
if (blktab->b_regs > maxregs)
maxregs = blktab->b_regs;
```



to this 1 line:

```
maxregs |= blktab->b_regs;
```

P.S. I am working on a version of 'adb' for sozobon. Mail me if you are
hot to try the beta and are familiar with 'adb'. (Especially if you
like 'adb' more than 'sdb')

P.P.S. How do I get arkenoids to run under TOS 1.4? The wife needs it badly.

[message precis: "perhaps the 40-folder bug is back in a new guise"]
>1.0) another bug was introduced. It seems that the directory buffers
>now overlap slightly with the dynamic memory pointer list. This means
>that when you have accessed more than about 35 folders and then try to
>allocate memory, there is a good chance that the program will bomb
>horribly.

This note is not a flame, but a request for information and also a
data point for those debugging:

Bug: zoo.ttp, arc521.ttp die horribly under suspicious circumstances.

Environment: 1040 expanded to 2.5Mbytes, TOS 1.4 of 6 April 1989 in
ROMs, Supra adapter & boot software rev 3.41 (? sorry, its @
home), Quantum Pro80 scsi drive, partition C is 32 Mbytes and
contains 195 directories and 1700 files (+/- 5%). Running
CACHE256.PRG in AUTO\, but not FOLDRnnn.PRG. Have a blitter.
Running CONTROL.ACC, no other .ACC's; 200 Kbyte ram drive on
H: (EDISK.PRG).

Repeat-by: from desktop, run menu File/Info against drive C icon.
Reports indicates 6.1 Mbytes free on C:; invoke Marc Williams
Co MSH.PRG (version 3) to obtain shell, run MF.TOS (a utility
of mine own creation :-) and observe 1.9 Mbytes free RAM.

Then cd off to a directory 4 levels down
(c:\arch\utl\src\emacs3v9) and run 'zoo aM emacs.zoo *'. Zoo
runs along nicely for about 8 files and then reports 'file
baz: read error' or 'input error on baz' or something along
those lines. Cat'ing the file to stdout shows no problems.
Rerunning zoo gets the same error at the same place again.
Running 'arc521 a emacs.arc *' gets a 'write error: no space
on disk??' at a different file, which again cat's out in a
normal fashion, and again the fault is consistent and
reproducable; there is still 5.5 Mbytes free on the partition
according to DF.PRG. This general pattern could be repeated
in many different directories; the Supra utilities report the
disk is error free.

Workaround-by: I ended up using gnutar and compress. No problems
ever.

Hope someone can make something of this. My suspicion: gnutar does lots of I/O but only allocates a little memory. Compress allocates one largish (~500k) chunk before it starts doing I/O, but none thereafter. Am I correct in guessing that zoo and arc tend to allocate and release memory in a fairly dynamic fashion while doing large amounts of I/O concurrently? According to the posted bug report, this would tend to excercize the buffer-pool vs. free-list collision bug... or so I surmise. Help?

A few months ago START magazine had a CW TUTOR program and this month's issue has some practice/tutorial files for it.
Also many of the public domain cw/rtty programs have a code practice mode.
Still, if you plan to get your license and get on the air the best thing you can do is try to copy novice band QSO's (ham radio contacts). If you learn with computer generated code you *will* find it harder to copy human produced code because it's never as perfect or consistent.

I purchased Practical Solutions' Videokey box for my 1040. Depending
on the quality you're aiming for, this may be "good enough"; the price
is right ($99). Don't expect broadcast quality (not by a long shot).

>Maybe this will do for video what MIDI did for synths.

Well, it might- if Sony were still putting the jack on their
equipment! The latest generation of Sony controllers use "Control-S",
not Control-L. Control-S uses a 3-wire, stereo-mini-plug type
connection, rather than a 5-pin mini-DIN. I have no idea how
compatible they are at either the protocol or electrical levels.

```
]
] Can the CAD 3D II use more than 1 meg of memory? That is, can I use more
] and/or more complicated objects if I have over 1 MB of memory?
]
] Is there some way to play Cyber-animations from Hard Disk? In that way I
] could have even 80 MB (or over) of continuous Cyber-animation. Is this
] possible?
]
] Please, inform me because I am going to buy a hard disk and a memory
] upgrade.
]
```

Yes, Cad 3D can use as much memory as you have available. But you will still be limited to the 80 object maximum. With the animation player program, animate4 (or 3 whatever version you have) you can create a batch file that will play an animation, load another and play it, load another and play it, and so on. Therefore, it is possible to have ove 80MB of continuous Cyber-animation. I do alot with Cyber Paint & Cad 3-d II so maybe we could send our files back and forth and check out each other's work. Merry Christmas.

First, a note about strncpy(). The ANSI standard (yeah, I know, "proposed")
describes strncpy() like this:

The 'strncpy' function copies not more than 'n' characters
(characters that follow a null character are not copied) from
the array pointed to by 's2' to the array pointed to by 's1'.[121]
If copying takes place between objects that overlap, the behaviour
is undefined.

If the array pointed to by 's2' is a string that is shorter than
'n' characters, null characters are appended to the copy in the
array pointed to by 's1', until 'n' characters in all have been
written.

[121: Thus, if there is no null character in the first 'n' characters of
the array pointed to by 's2', the result will not be null-terminated]

Secondly, the dLibs version is (slightly) broken according that the above
description. It only copies up to the first null character, or 'n'
characters total, and does NOT pad the copy will null characters up to 'n'.
This almost never causes a problem, since the destination is null-terminated
in that case, but I thought I should point it out. It's also easy to fix,
but I'll leave that as an exercise for the reader :-)

>
> In particular the issue of size zero. Does a unix realloc() free
> or size down to zero?

Much of this behaviour, though convenient, is new with ANSI C. I thought
it would be helpful to include it, since it's upwardly compatible with
old code. Thus speaks X3.159...

Description

The 'realloc' function changes the size of the object pointed
to by 'ptr' to the size specified by 'size'. The contents of
the object shall be unchanged up to the lesser of the new and
old sizes. If the new size is larger, the value of the newly
allocated portion of the object is indeterminate. If 'ptr' is
a null pointer, the 'realloc' function behaves like the 'malloc'
function for the specified size. Otherwise, if 'ptr' does not
match a pointer earlier returned by the 'calloc', 'malloc' or
'realloc' function, or if the space have been deallocated by a
call to the 'free' or 'realloc' function, the behaviour is
undefined. If the space cannot be allocated, the object pointed
to by 'ptr' is unchanged. If 'size' is zero and 'ptr' is not a
null pointer, the object it points to is freed.

Returns

The 'realloc' function returns either a null pointer or a pointer
to the possibly moved allocated space.

Now having said that, I want to report a bug in dLibs 'realloc' recently
located and fixed by Anthony...

```
> Description:
> realloc() fails to shrink properly for real small chunks
> (smaller than the size of a header + pointer field).
```

The guts of the fix are a few lines in the source file "realloc.c" at
the beginning of the realloc() function itself.

```
> if(addr == NULL)
> return(lalloc((long) size));
> if(size == 0)
> {
> free(addr);
> return(addr);
> }
> p = addr - 1;
> n = p[0] & 0x00FFFFFL; /* get actual block size */
>/* buggy line
> m = (((long) size) + 5L) & ~1L; /* calculate new block size */
>
>/* fix here */
> if( size <= 4 )
> m = 8L;
> else
> m = (((long) size) + 5L) & ~1L; /* calculate new block size */
```

Thanks to Anthony Howe (and Michal Jaegermann who relay this report and
has reported several previous bugs) for finding and fixing this.

One final note about dLibs... version 2.0 is in development, and has
been for some time. It will still be something like 6 months before
it is completed, but it's a complete rewrite with major contributions from
a great number of talented "net gods". It will be fully ANSI compliant
and quite a bit better than dLibs 1.2, or any other C library I've seen.
In fact, it's very possible that NO dLibs 1.2 code will survive to be
included in the final 2.0 :-)

I tried to respond to a question posted here about the desktop.inf file.
Unfortunately, the mailer could find "inmet." Here is the core of my reply:

In article <30200017@inmet> you write:
>
>Along the same lines, can someone tell me where I can find the info to
>decode the desktop.inf file ? What do all of those number mean ?
>

Haynes, McKendre. "Customizing the GEM Desktop." Compute!'s Atari ST Disk and
Magazine, April 1987, pp. 36,42.

The numbers are hexadecimal and are bit settings for a variety of stuff
ranging from the RS-232 port to what applications are installed.

I also have a utility that modifies the icons but I don't remember which
magazine it came from.

Hope this puts you on the right track if you weren't already.

(I would have mailed this, but none of the machines around here have ever heard
of Canada before. Or any other country either.)

In article <1870@calvin.cs.mcgill.ca> depeche@calvin.cs.mcgill.ca (Sam Alan EZUST) writes:
>someone already sent me dlibs memcpy which I believe is what is used
>in Sozobon.... However, I don't have an assembler and am not too
>much of an expert in it anyway, so I couldn't get it installed on
>my system without help.

Okay, here's one in C:

```
memcpy(dest, src, count)
register char *dest; /* destination address */
register char *src; /* source address */
register int count; /* number of bytes to copy */
{
while (--count >= 0)
*dest++ = *src++;
}
```

This can copy up to 32767 bytes at a time. It isn't very fast, though.

>: Alternately, does Lazer C allow copying structs using a simple
>: assignment? <struct2> = <struct1>; If so, what I've ocassionaly used in
>: situations like yours is to define a struct containing the array and
>: moved copys of the array arround by just using assignments...
>
>that's a good idea. I should try it. I didn't think it was possible though,
>as struct names are just pointers to memory locations of data, just
>like arrays, and you can address the 5th byte of a struct with
>*(structname+5) just like arrays.

No. A struct variable is not treated as a pointer. If you do something
like this...

```
struct dirent d;
somefunc(d);
```

... then somefunc will be called with a copy of d as its argument,
and the copy will be sizeof(struct dirent) bytes long, on the stack!
It does *not* pass a pointer to d. Laser C can handle struct assignments.

And any attempt to add an int to a struct should net you an error message.

> in reply to my using strncpy for multidimension arrays not working,
>
>: Why won't it? Ignoring for the moment that strncpy isn't a blkcpy or

>: memcpy, what's wrong with specifiying &array[0][0] as the address and

>: as the length?
>
>I think I tried it and got a compiler error.. I could be mistaken, but
>I passed it just
>
>array
>
>instead of
>
>&(array[0][0])
>since I thought the two were equivalent pointers...

They both point to the same place in memory, but they are pointers to different types of data. The first form is a pointer to an array (a vector, actually -- the first column of your two-dimensional array). The second is a pointer to a single element. The distinction isn't very important when you're using the expression as an argument to memcpy(), though.

The simplest way to copy a two-dimensional array with memcpy() is:

```
memcpy(destarray, srcarray, sizeof srcarray);
```

Some compilers may complain about this since the first two arguments are not of type (char *). You may wish to coerce them to get rid of the warning and improve portability, at the expense of readability...

```
memcpy((char *)destarray, (char *)srcarray, sizeof srcarray);
```

4230. Re: VIRUS PREVENTION AND HELP FOR SPECTRE OWNERS

Newsgroup: comp.sys.atari.st
Date: 1989-12-15 20:52:26 UTC
From: psurge@cs.utexas.edu
Message-ID: <7371@cs.utexas.edu>
Source record: 245604

We here at UT have known about this virus now for about a week. The two ways mentioned before (via virus detective and Res edit) both work, but get disinfectant 1.4, which should be available now (we've had our copies for 5 days now.) It will automatically kill WDEF, as well as all the other MAC viruses.

So far, I have not seen any ST's infected. I checked all my disks and my hard drive with Disinfectant 1.4, and none have had it. Disinfectant 1.4 also has a nice history and description of what it does.

WDEF still comes back, but we have pretty much licked it here. When we first found out about it, we found it on all our servers, but like I said, with Disinfectant 1.4, it it almost gone (but seems to want to keep coming back, also!)

This virus is not just in the US, it was discovered in Belgium, so all you European Aladian users (as well as Spectre) should check for it too.

Try checking the size of your system buffer in Uniterm. It may not be big enough for Uniterm to print a metafile... Try boosting the buffer marked "System" to 100-200 K.

Also, be sure that you have a valid ASSIGN.SYS file that includes the META.SYS driver.

One low-power fireball always destroys these guys, but they're fast, do heavy damage, and have nasty poison.
>
>Warning on the wall says "No Fireballs" and means it! They are turned
>back on you immediately. I ran into some knights that make DM I knights
>seem like they were already dead.

Tell me about it! All the armor they're wearing is cursed, too. Exactly what difference is there between a cursed and an uncursed item in DM/CSB? I remember finding cursed items in DM, but don't recall what negative effect the curse had.

>And all my team is master in all 4 categories.

I think I formatted over my team of DM Champions. :-(I started CSB with new champions from the Prison, which are unfortunately not as advanced as the characters I had in DM.

>
>Where is the water?

In the "Supplies for the quick" room (referred to as Quickstop by the Oracle), there is a waterskin in one of the alcoves. I managed to pick up every item in this area, which included: sword, Staff of Claws, a teowand, Claw Bow, another staff I can't recall the name off, an axe, a mace, much food, a waterskin, and a ful bomb. This may not be an exhaustive list.

Not quite. In the first case, a legal assignment would be
fred = "Goodbye"; /* 'fred' now points to a different string */

This assignment fails in the second case.

>could have even 80 MB (or over) of continuous Cyber-animation. Is this
>possible?

Yes to both questions. In fact, I find CAD 3D II pretty crippled
in 1 Meg unless I remove almost everything from C:\AUTO. And yes, on
Compuserve I saw a program which plays large .DLT animation files directly
from the hard drive. Perhaps someone who has already downloaded it can
send it to comp.binaries.atari.st. If not, maybe I'll try to find it
again on Compuserve.

I kind of wish I had more time to play with CAD 3D, Cyber Control,
et al. It's really ideal software for a 'personal computer.' You can have
so much fun (for a great deal of work) creating objects and doing strange
and twisted things to them. I've even put some animations on video tape,
thanks to Practical Solutions video cable. In a sense, the Cyber system
really represents what I bought a home system for in the first place --
being creative, and doing neat graphic doodads, just for the fun of it.

Maybe if I ever get a TT (smiley alert), I won't have to wait so
long for CAD 3D to do anything. If only Tom Hudson hadn't used floating
point... you can still accomplish everything with 'fixed-point' or even
just integer coordinates on a very large scale.

Ralph Haglund, please don't do that again. You are posting information from Atari developer documentation, which is both copyright by Atari and released under nondisclosure agreements to Atari developers.

The main reason we'd like you not to do that is the possibility of introducing errors in transcription. When you say something is official, people rely on it. When it turns out to be wrong, they get mad at ATARI, not at you.

That and other reasons are why we say people should get things like STe documentation by becoming developers and getting them through channels.

4240. RCS for the ST (no, not yet)

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 00:04:25 UTC
From: alex@athertn.Atherton.COM
Message-ID: <15412@laurel.athertn.Atherton.COM>
Source record: 245614

Well, I've got my hot little hands on the source code for the original
UNIX RCS system, and plan (in my copious spare time :-) to start porting
it to the ST. Anyone have any suggestions/comments/etc. to make about
conventions I should follow, or other, similar things?

For example, I think that things are stored in RCS in the form
<filename>.c,v
which is fine for Unix, but...well, you know how the ST is. I'd planned
to change this to
<filename>.c_v

Any objections?

Cheers,

--

>my local computer stores and no-one seems to be able to get it.
>
> Does QMI sell direct? And does someone have their address?
>

I was a co-author of deskcart. Whether it is still being sold? I have no
idea. I have'nt seen a check in a long time (no suprises there!). But
the last known address is: QMI PO box 179, Liverpool NY 13088
(315) 451-7747

In any event, tell em' I sent ya, and see if he's still got some...
DO NOT just go and mail a check. Find out first.
I also write PRINT-IT!, which, QMI never marketed (It "sensed" deskcart
and replaced some items if it found it too). Actually... I wish I knew
someone with "electronics knowledge", to make a new cartridge for the ST...
I wont let the cat outta the bag as to what it is. But, I can guarentee
that EVERY ST user that USES his ST would HAVE to HAVE IT!

4243. THINK C's source debugger and Spectre

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 02:33:00 UTC
From: barbanson.pa@XEROX.COM
Message-ID: <891215-183332-2628@Xerox>
Source record: 245617

Has anyone tried to do cross-development for the Mac on a Spectre?
I'm trying to use THINK C on an ST + GCR. The compiler works fine but the source debugger freezes up.
The best thing about THINK C is the source debugger and the idea of having to go back to print statements is really distasteful knowing that there's an alternative. Not to mention that it slows down debugging tremendously.
Does anyone have an idea wether there's a chance that the debugger could work with a bit of hacking on the Spectre code or is it a lost cause?
Doug W@gadgets seemed to indicate on GENIE that the Mac debuggers are using vectors that the Spectre needs to work at all on the ST.
Does it mean that no hack known to mankind will get this to work?

-M

P.S: Please cc any answers to me. Thanks.

4244. 520 St for sale...

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 02:33:22 UTC
From: holicky@cs.buffalo.edu
Message-ID: <14848@eerie.acsu.Buffalo.EDU>
Source record: 245618

I am posting this for a friend- please do not reply directly, but
rather call him at the number below if you are interested.

FOR SALE:
Atari 520 St- includes:
SC1224 monitor,
a single sided and double sided floppy drive,
and plenty of software (including MWC, pascal,
prolog, shells, and plenty of games).

The system is about 3 years old, and has been rarely used...a real
dust collector- (it looked new to me...)

There is no set price, any reasonable offer will be accepted.

Call (716)247-3648 and ask for Ray if you are interested.
He is living in Rochester N.Y.

4245. I/O redirection to the printer

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 03:19:00 UTC
From: UI0T@DKAUNI2.BITNET
Message-ID: <"89-12-15-19:19:25.76*UI0T"@DKAUNI2.BITNET>
Source record: 245619

I am having a strange problem with I/O redirection. To redirect
standard output to the printer, I wrote the following test program:

```
#include <stdio.h>
#include <tos.h> /* Turbo - C 's header for TOS stuff */

main()
{
int oldstd;
int printhandle;

oldstd = Fdup (1);
printhandle = Fdup (3);
printf("oldstd = %d, printhandle = %d\n",oldstd,printhandle);

Fclose (1);
Fforce (1, printhandle);
printf("Hello, world!\n");
/* Cconws("Hello, world!\n"); */

Fclose (1);
Fforce (1, oldstd);
Fclose (oldstd);
Fclose (printhandle);
}
```

This program worked as it should; it printed out
Hello, world!
on the printer. However, when I commented out the printf statement
and used Cconws instead, it seemed to go into an endless loop; I
could still move the mouse around, but that was it for at least 10
minutes (I did not wait any longer). Oh, by the way, the printer WAS
online and ready. Without the I/O redirection, Cconws worked fine;
it printed out "Hello, world" on the screen. No accessories or
memory resident programs were active at the time.

The problem with Cconws occured both with Turbo C V1.1 and with
equivalent code (calls to the GEMDOS library) in SPC Modula V2.0.

I am using a Mega ST2 with TOS 1.2 (1.4 has not made it here yet) and
a Megafile 60 hard drive.

Is there something wrong with my code (but WHY did printf work,
then?), can anybody reproduce this strange behaviour, is this a bug
in TOS 1.2 which has/has not been fixed in TOS 1.4, ... , in short:
WHAT IS GOING ON?

Any help appreciated.

From: kbad@atari.UUCP
Message-ID: <1891@atari.UUCP>
Source record: 245621

STJLHI33@WATSON.BITNET writes:

| Now I find out that Atari crippled the Mega2s in an effort to rip off it's
| customers.

Atari did _NOT_ cripple the Mega 2's in an effort to rip off its customers.
To clarify what I said in a previous post: due to manufacturing
constraints, a VERY FEW Mega 2's have been produced which can not be
upgraded. I was cautioning people who want to upgrade their Mega 2 by
getting extra RAM installed at a service center that it is _possible_ that
it may not be as simple as just installing the extra RAM.

Context, people - please!

The new machines which we are producing allow easy memory expansion:
STE's by adding SIMMs on the motherboard, and TT by memory expansion
cards (the "fast" TT RAM cards use SIMMs as well).

4248. Rainbow TOS Addendum (text)

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 04:22:33 UTC
From: kbad@atari.UUCP
Message-ID: <1892@atari.UUCP>
Source record: 245622

Per several requests, here is the TEXT version of the Rainbow TOS documentation addendum which dealers _should_ be giving out with the Rainbow TOS upgrade. If your dealer does not stock published copies of this document, please have them contact Atari Dealer Service.

Many thanks to GEnie SysOp Jeff Wilson for typing this in from the pamphlet and making it available via GEnie.

====

ATARI RAINBOW TOS ADDENDUM
==========

NOTICE: Rainbow TOS must be installed by an authorized Atari dealer.

The new Rainbow TOS provides many improvements to your computer's GEM Desktop operating speed and make your computer easier to use.

To make sure you have Rainbow TOS installed in your computer, select the Desktop Info option from the Desk menu. This dialog box appears.

```
---------------------------------------
| GEM, Graphic Environment Manager |
| TOS |
| ------------------------------ |
| /|\ |
| ATARI |
| |
| Copyright 1985,86,87,88,89 |
| Atari Corporation |
| Digital Research, Inc. |
| All Rights Reserved |
| |
| ---------- |
| | OK | |
| ---------- |
---------------------------------------
```

File Selector (formerly Item Selector)

Two important changes affect this dialog box. One is the the addition of the Drive Selector. The other is improved use of wildcard characters.

The Drive Selector displays drive identifier letters A through P. Click on a letter to select that drive. Drive identifiers representing uninstalled drives appear in a light typeface and cannot be selected.

Use of wildcard characters allows you to more easily control the Directory window display. Use wildcard characters to replace portions of the last section of a pathname on the Directory Line.

For example, if D:\SALES*.DOC appears on the Directory Line, only files with the .DOC extension will display in the Directory window. To display the entire contents of the subdirectory SALES delete .DOC and replace it with the asterisk wildcard character. Refer to your computer owner's manual for further instructions on using wildcard characters.

To display the new directory, press [Return].

Move Files

With Rainbow TOS you can move a file from one folder or drive to another in addition to copying the file.

First, select the file(s) you wish to move. Then hold down [Control] as you click on and drag the selected file(s) to a new location. During the move process, a Move File(s) dialog box displays the number of files being moved. As each file is moved, the Move File(s) dialog box displays the file's name and complete destination (disk or logical drive letter and folder name).

When you copy or move files, Rainbow TOS does not change the date and time stamp of those files. File date and time information will only be updated when the file is changed.

Skip a Single File During Group Copying

The option to skip a single file during a group copy procedure becomes available when a file name conflict occurs. A file name conflict occurs when a file is copied from one location to another and a copy of the file already exists at the new location. The following three options are presented when a name conflict occurs:

Copy Rainbow TOS overwrites the existing file and
the copy operation continues.

Skip Rainbow TOS does not overwrite the file.
Continues with the copy operation.

Quit Rainbow TOS does not overwrite the file. Ends
the copy operation.

Abort Group Copy, Move, and Delete Operations

You can abort the copy, move, and delete operations performed by Rainbow TOS. Press and hold down [Undo]. A dialog box displays, giving you the choice of continuing or ending the operation.

MS-DOS Compatible Floppy Disk Formatting

Disks formatted with Rainbow TOS are fully MS-DOS compatible.

Auto-Boot Applications

The Install Application option of the Options menu allows you to assign an auto-boot feature to any GEM based application programs. An installed application automatically opens when you boot the system. You can select applications with .PRG, .APP, or .TOS extensions.

Follow these instructions to start an application from a data file or autoboot an application.

1. Select a program file (.TOS, .APP, .PRG) from a directory window.

Select Install Application from the Options menu. The Install Application dialog box appears, listing the application program file you selected from the desktop.

2. To install the application to run from a data file, type the correct data file extension in the Document Type field. This is the common extension of the files that use that application. (Consult the manual supplied with the application for the most common file extension.) If you install an application to autoboot, you may leave the Document Type field blank.

Note: Some applications can open from a desktop data file only if the data file resides in the same folder as the application program files. Check the documentation supplied with the application for more information.

3. Select boot status: Auto to autoboot an application, or Normal to start an application from the desktop.

4. Select an application type. Your choices are GEM, TOS, and TOS-takes-parameters.

Most programs that run from the desktop have the extension .PRG or .APP. Both of these extensions indicate a GEM application. However, some applications have the extension .TOS or .TTP. The extension .TOS indicates a TOS application. The extension .TTP indicates a TOS-takes-parameters application.

Note: To use a .TTP application, first select the application, then enter the required parameters when the dialog box appears.

5. Select OK to finish.

6. To save the application's installation, select Save Desktop from the Options menu.

Disk Copy/Format Dialog Box

Rainbow TOS uses a combined dialog box for copy and format operations. This box displays when you select either the Format option from the File menu, or drag a disk drive icon on top of another disk drive icon.

Select Copy or Format from the Copy and Format dialog box. Select from the available options and click on OK. The bar graphs in the lower half of the screen graphically detail the copying or formatting that occurs.

Changing a Folder's Name

With Rainbow TOS you can change the name of a folder. Click on a folder and select the Show Info option from the File menu. The Folder Information dialog box displays. You can now type in a new name for that folder.

Keyboard Reset

You can now reset your computer from the keyboard. Hold down [Control] and [Alternate], then press [Delete]. This key combination is exactly the same as pressing the Reset button.

Pressing [Control] [Alternate] [Right Shift] [Delete] causes a VERY cold boot. It clears all of RAM (except about 64 bytes at the bottom) and then jumps to the ROMs. This cold boot clears all reset-proof RAMdisks and other data and variables that are cleared by a cold boot but not a warm boot.

Atari, the Atari logo, Rainbow TOS and TOS are trademarks or registered trademarks of Atari Corporation. GEM and GEM Desktop are trademarks or registered trademarks of Digital Research, Inc. MS-DOS is a registered trademark of Microsoft Corporation.

>information (on a level equivalent to "How do I program DMA sound?")
>from an auto manufacturer isn't all that easy either. Try it some time.
>
I can walk into any decent auto shop and purchase a repair manual for most cars available in America. I can walk into any computer book store and purchase cubic yards of books on how to program an IBM PC or a Macintosh. In both these cases at least one version of this information is published by the manufacturer, and can be purchased for less than $30.

The only Atari-approved source of this information is the developer's kit, which is over $100 last I heard. The alternatives are reverse-engineering exercises like Abacus books and the documentation supplied with various compilers.

I don't require this information to be free, but I would like it to be available from Atari for a price that meets my need for it (generalized hacking around, little possibility of commercial success).

Dear netters,
the new pcemulator here in germany is delta modul. It has processor
80386SX at 16 Mhz, optional 80387sx/16. 1Mb/80ns ist installed on board,
2mB are possible. With add on card 8 mB are possible.
Memory can be used as ram under gem or as add on memory.
It has second a 68000 at 16MHZ optional with 8 Kb Cache memory.
VGA or ega card can be built in the AT-Slot. VGA can be driven under
gem with special dvi-driver.
Later it can be possible to built in a signalprocessor DSP56001 to
reach 10 MIPS.
The emulators is directly connected to the processorbus.
It comes with MSDOS 4.01. Price is 1898 Deutsche Mark plus 98 Deutsche
Mark for cache memory.

This info from Alan Pratt I also got privately, and privately I gave a lengthy answer. In short: I am an "official developer", but have not got a single sheet of info from ATARI Sweden ever since I bought the kit and got a bunch of badly copied papers. It was clearly stated in my message that I had made a quick resume of an article in a German magazine, and I do think the netlanders have the same priority as the German ST community, correct me if I am wrong.
Half a year ago or so I also sent in some sheet from the original developer kit to Atari USA, to get some additional info. Nothing has reached me from them either.
In June or so I called Atari Stockholm, was promised TOS1.4 and docs in a few weeks. Still NOTHING. To be able to work I have made a copy of the ROMs, that come with the big screen monitor..... That is the only way a Swedish developer can get TOS 1.4, any comments?...
Sure, I hope soon to get the developer's info about the STE, I will gloat over all the secrets I have promised not to disclose to any human being, just for the chance of making better programs than the demos accompanying the STE. Shouldn't take too long I must admit. One big screen, where the mouse can show 3x3 normal screens. One sound show of a minute or so, playing 3-4 different sounds a couple of times.
ST Magazin in Germany at least sells a diskette for DM19:90 with a demo of the 4000 colors at the same time. WITH assembly code.
I hope none from Amiga or Apple will read this, so they can steal ideas; suppose that is what the secrecy is all about.

You could also check out your local ham radio store (if there's any); the 13 pin "ATARI-style" jack can be found on e.g. the KENWOOD TS-440 shortwave transceiver (the chance to get this connector there is rather low: I've got my connector for the TS-440 at the local computer store...).

What do we learn from this?

- don't connect your SM124 to a shortwave transceiver
- there has to be a weird standard somewhere
- ...and at least two manufacturers joined this standard.

Have fun, Ralf

Manx produces a C compiler for a number of machines called Aztec-C.
It's a nice compiler and among it's many options are ones for creating
romable code and S-record file output for creating eproms.

Another nice feature is that Manx has put in a -lot- of effort to keep
all of their compilers as compatable with each other as possible. As long
as you avoid using machine specific constructs or operations, you can buy
(for example) Aztec-C for the IBM, Amiga, Mac, Apple II, etc. and port your
program(s) to those machines with little or no effort...).

The only disadvantage to Aztec-C is it's not easy to find. Your best
bet would be to call Manx and order it directly (as I did).

The old version of the ST developers kit had a linker that also
allowed creating romable code and a converter program that would
generate S-record files for eproming...

STOOP%KVI.nl@CUNYVM.CUNY.EDU asks about bells:

Looks like the Laser C library is a little screwy (what else is new?).
If you use Cconout(BELL) (#define BELL as 7 - it makes your code more
readable), you can bypass whatever stupidity is going on in your libs.
I don't know if Bconout(2,BELL) will work or not - if it does work, it
will make your bell redirect-proof in TOS programs.

I have a problem finding a color printer driver for my Star NX Multicolor printer that will enable me to do color sceen dumps the one that is listed in the Atari control panel doesn't seem to work for me I have not been able to find any information on this subject and I have seen one working for the Amiga. I would appreciate any suggestions as to how I might make it work so that I can stick back the color ribbon in the printer and make some use of this printer. I am quite surprised that their isn't something out there that will work as I have yet to pick up a Atari magazine and not seen at least 1 Star color printer advertised! I have had a 1040St since this August after selling my Apple IIe system and have been amused by all the gripping I have seen on this board on about Atari well let me tell you the same kind of thing goes on in the Apple World and I can bet that the other systems have similar beefs but the bottom line has to be that they are all in it to make a Buck! so when you have to dish out that $100.00 for up grades remeber that Apple users have been doing just that for years. I would like to thank anyone in advance if they can offer me some help or suggestions as to which program I might purchase that would have the right printer driver in it.
Thank you very much

I have a problem finding a color printer driver for my Star NX Multicolor printer that will enable me to do color sceen dumps the one that is listed in the Atari control panel doesn't seem to work for me I have not been able to find any information on this subject and I have seen one working for the Amiga. I would appreciate any suggestions as to how I might make it work so that I can stick back the color ribbon in the printer and make some use of this printer. I am quite surprised that their isn't something out there that will work as I have yet to pick up a Atari magazine and not seen at least 1 Star color printer advertised! I have had a 1040St since this August after selling my Apple IIe system and have been amused by all the gripping I have seen on this board on about Atari well let me tell you the same kind of thing goes on in the Apple World and I can bet that the other systems have similar beefs but the bottom line has to be that they are all in it to make a Buck! so when you have to dish out that $100.00 for up grades remeber that Apple users have been doing just that for years. I would like to thank anyone in advance if they can offer me some help or suggestions as to which program I might purchase that would have the right printer driver in it.
Thank you very much
Brian Beach

>customers.

It was probably an effort to save a few pennies.

I thought it was just *some* Mega 2's that were crippled. Any-road-up,
Frontier Software in the UK offer a 1/2meg or 2meg solderless RAM
upgrade which will upgrade any 512k ST to 1meg and, by switching chips
at a later date, upgrade a 512k machine to 2.5meg. More to the point, it
also claims to upgrade a Mega 2 to a Mega 4.

If your MMU and shifter aren't socketed I believe they will fit it for
you...

I'll send more info if anyone's interested.

Cheers,
Mark.

A friend of mine (an Amiga developer) has RCS for the Amiga, and has given me the source code for it.

I haven't had time to port it yet, but the code doesn't look like it will have to be changed at all (it was already altered to the Amiga Lattice C format, which looks just like GNU C, the compiler I'll use).

Keep working on it, and keep in touch with me via E-mail so we can compare progress.

I looked at about a third of the stuff (unfortunately, there don't seem to be mail response or anonymous uucp archives for comp.sources.amiga: there's ftp at xanth, and there are [amiga format, of course] disks available from Fred Fish). It looked like at the very least a lot of filename conversion would be needed. The spawn mechanism on Amiga may also be more UNIX-like than on the ST.

>
> Has anybody had the possibility of working with the Stacey display? I
>heard that it is pretty bad and that it is better to wait for an upgrade.
>Is this true?

I saw it at a meeting of the local Atari Users Group (BAAUG). The display
is not "perfect" (but in this world few, if any, things are), but is quite
good for the price.

The only REAL problems I saw with it were...

1) It is a little slow. If you move the mouse too fast the pointer
will dissapear. Also "rapidly moving" graphics will fade or
dissapear.

I don't see this as a problem (for my uses). You don't need to make the mouse
"fly", and most of what I use my ST for will not involve rapid movement.

2) If the "brightness" and "contrast" are set VERY HIGH there is a
tendency for symbology below large white areas on the screen to
to be "dimmer" than symbology that is not below large white areas.

Again I don't see this as a problem (for my uses). The range of "brightness"
and "contrast" is more than adaquate... no one should have to set these
controls anywhere near their limits.

Depending on your intended use these may or may not present problems for you.
If these limits are unacceptable for you, I wouldn't recommend getting the
Laptop ST. For my uses, these limits are entirely acceptable in trade for the
portability (besides, you can still connect either mono or color monitors
to the Laptop for the occasional application to which these limits present
problems).

4263. WOULD *YOU* BUY A NeXT COMPUTER? (Read even if you wouldn't)

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 18:45:32 UTC
From: amthor@umaxc.weeg.uiowa.edu
Message-ID: <306@ns-mx.uiowa.edu>
Source record: 245637
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,comp.sys.apple,comp.sys.ibm.pc

Hi. As many of you know, former Apple co-founder Steve Jobs has founded a new company that has produced an advanced personal computer/workstation known as the NeXT computer. This computer has been initally targeted at the university community, with more recent expansion into the mainstream business market. I won't belabor you with the details, but the NeXT computer is viewed as important because its pioneering application of new technology and a rather advanced bundling of both hardware and software, making the "lowest common denominator" (to which most developers write applications) rather high. The machine is somewhat controversial, as some are irritated that yet another standard has reached the marketplace, while some others believe the NeXT promises more than it delivers. On the other hand there is a growing group of NeXT fans who see it as THE platform for the future.

Fans and flamers alike share one uncertainty, however: Will the NeXT succeed in the marketplace?

I'm not in a position to answer that question, but I CAN tabulate what USENET readers think of the NeXT, and summarize that information for the net.

As a graduate student interested in buying a NeXT, I realize that part of what holds me up is my ignorance of what *other* people think of it. My reasoning is this: if most other people aren't even close to buying, the NeXT will fail; if others are held back by mere (fixable) technicalities, the NeXT will likely succeed.

Even if you haven't heard of the NeXT, you can help me by at least saying that. Like any survey, this one will benefit from a high percentage of returns--please vote! Of course, since returns are voluntary and readers are preselected by their subscription to USENET, results will be unscientific. But I am certain they will help me, and I WILL SUMMARIZE TO THE NET so that everyone else's curiosity can be satisfied.

There are only 10 questions. When multiple choice options are offered, please select as many as apply--but IN ORDER OF PRIORITY. Feel free to add whatever comments you wish, but keep in mind that multiple choice selections are easier to summarize. Also, unless you indicate otherwise, summaries to the net will be ANONYMOUS, so if you secretly love or hate the NeXT, you needn't worry about the secret getting out.

PLEASE REPLY BY E-MAIL. Postings will quickly dwarf the net, I may miss your posting, and I will summarize to the net anyway.

Be assured that I have no affiliation whatsoever with NeXT or Businessland.
Though I am a graduate student at the University of Iowa, this survey
does not represent the interest of UI.

SURVEY:

1. What is your occupation?

2. What computer(s) do you presently own or use regularly? What other
computer(s) do you have actual experience with?

3. What contact have you had with the NeXT computer?
A. Never heard of it
B. Heard it talked about
C. Have seen print ads (name publication)
D. Have read articles about it (name publication)
E. Have seen one in use or in demonstration (where?)
F. Have tried it myself in demo (where?)
G. Have used, or borrowed access to it, for some time
H. Currently own it or have it provided for my own use
I. Other (please specify)

4. How interested are you in purchasing a present or future version of the
NeXT, or having your department acquire one for your use? (Specify
purchase or department acquisition)
A. Not even remotely interested, ever
B. Haven't really though about it
C. Wouldn't rule it out somday
D. Would be interested *if* certain conditions were satisfied
E. Would be *very* interested if certain conditions were satisfied
F. Am literally ready to buy once certain conditions are met
G. Am ready to buy right now
H. Already own or have sufficient access to a NeXT
I. Other (please specify)

5. If you named conditions in (2), which of the following apply? (Please
name only those conditions that are *conditions*, not wish lists.)
A. If I can find the money
B. If the NeXT comes down in price (How much? Off of university or
Businessland prices?)
C. If I can get a hands-on look/feel (demo? rent? 30-day guarantee?)
D. If color arrives
E. If the CPU is upgraded to a 68040 and/or graphics are sped up
F. If the floptical drive is made faster
G. If the floptical drive is doubled in capacity to 512 MB
H. If laser printing can be handled more seamlessly
I. If the NeXT can be better integrated with existing equipment
(name existing equipment)
J. If a 3-1/2" floppy disk drive is bundled
K. If a supplemental operating system runs in emulation or via
co-processor, or if another UNIX variant runs (name the OS or
variant)
L. If a certain software category is filled by a high-quality

application (name category)
M. If a certain software package or language (such as C++) is ported
to the NeXT (name item)
N. If NeXT applications in general reach a critical mass
O. If the NeXTStep interface is improved (name improvement sought)
P. If enough NeXTs are sold to make it a "safe" platform
Q. If a laptop NeXT arrives
R. If a multi-user NeXT arrives (1 cube, several full function inputs
that could either be dedicated Megapixel displays or NeXTStep
interfaces in non-NeXT boxes. Indicate Megapixel or non-NeXT; if
non-NeXT, specify the machine.)
S. If IBM, which has licensed the NeXTStep interface, markets it
T. If bugs are eliminated in the operating system
U. If hardware reliability improves/is proven
V. If distribution is widened to include my university (name university)
W. If distribution is widened to more commercial vendors (suggest one)
X. If my company/university/department endorses it (specify)
Y. If customer support is improved (name support sought)
Z. If.... (please specify)

6. Which of the above possibilities are not absolute conditions for you,
but would carry significant favorable weight in your decision?

7. If you aren't seriously considering acquiring a NeXT in any incarnation,
why not?
A. Very happy with my own system (please specify)
B. Don't have enough (or any) information about NeXT
C. Already plan to buy another system (which system?)
D. Price of NeXT is prohibitively high
E. Don't think the NeXT will ever catch on
F. Don't like the user/programmer interface (why not?)
G. Require a different primary operating system or UNIX variant
(specify OS or variant)
H. Hardware is inadequate for needs (what is missing?)
I. Have heard too many negative things about NeXT (such as?)
J. Think the NeXT is "too much computer" for needs
K. Buying a NeXT is politically impossible (why?)
L. Other (please specify)

8. Does the NeXT interest you enough that you want to find out more about it?

9. As a computer user, what percent of your interest or time is devoted to
end-user computing? To programming? To system administration? To
other activities (specify)? How might these percentages change if you
acquired a NeXT?

10. What do you think about how the NeXT has been marketed? Any suggestions
for improvement?

>
I have checkd it: There is really no script command. I had used
input redirection to build my libraries.

I hear there is revision 2.3 available ? Where did you get it ?

About bugs: The COMMON feature isn't a bug, but you may try:
character line*80
read (*,'(a)',end=9010) line
and answer with a carriage return only. Compiler revision 2.2 will
branch to the label 9010.

By the way, what is the actual release of Prospero Fortran ?

Greetings to all
uli

I'm pretty sure the source is freely redistrbutable. I like RCS as well.
haven't had tiem to port it to TOS yet though. (But now that GNUdiff is
available, it should be fairly easy.)

>specific to TOS 1.4. UniTerm works fine when started from the
>desktop, but when started from the Mark Williams shell, it will give
>bombs on exiting, and sometimes the computer will subsequently crash.

I was finally able to play with it and located the cause of the problem I
was having with UniTerm V2.0c.

It bombed both from NeoDesk and the standard DeskTop (2 bombs from the
DeskTop though instead of the 3 it gets under NeoDesk).

By enabling and disabling accessories I got UniTerm to run with no bombs
on exit. The accessory having problems with UniTerm was NeoQueue V2.03.

I understand Gribnif has a newer release of NeoDesk... I think I will report
this bug to them, and see if they can tell if the new release also has this
problem... maybe it is time to upgrade... again. :-)

By the way, I think the real source of the problem is inside UniTerm (probably
in the OSS Libraries, as you said)... sometimes after UniTerm bombs AES acts
very strangely, and a reboot (either warm or cold) completely corrects this
strange behavior.

4267. Another redirection question

Newsgroup: comp.sys.atari.st
Date: 1989-12-16 20:43:40 UTC
From: rogers@ncrcce.StPaul.NCR.COM
Message-ID: <1787@ncrcce.StPaul.NCR.COM>
Source record: 245641

I've modified the MicroEMACS that came with the Mark Williams C compiler to read standard input (e.g., you can put it at the end of the pipe and then view/edit the stuff that came out the pipe). Is there any way to re-connect the console to standard input so that a program (which itself used standard input) run from within the editor via system() will operate correctly?

In UNIX this is done by:

```
tty = open("/dev/tty", 0);
close(0);
dup(tty);
system("whatever"); /* "whatever" now has access to proper stdin */
```

I've tried a similar technique using the ST's "con:" device in place of /dev/tty but to no avail. Can anyone offer a solution?

In article <10059@saturn.ucsc.edu> sandy47@ucsco.UCSC.EDU (Larry McElhiney) writes:
>though their poison seems to wear off with time. I haven't been able to find
>any flasks for poison antidotes as yet.

The old worms' poison wore if with time also. I've found severl but only
one I could direct you to easily. On the first level, in between two pits
there is a flask. (passage lengths may be wrong)

```
pressure pad #1
|
| #### -> "supplies for the quick"
to the worms <- ######## <- pit #1
# <- flask
# <- pit #2
# <- pressure pad #2
#
### -> towards the "Run + Jump" pit
```

There's two ways to get to the flask. First, step on pad #1 then quickly
go forward 3 times and right once. That will put you in between the pits
and you can grab the flask. You can climb down the pits with the rope you
got in the worm room. (if you didn't get the rope, then you didn't get the
compass either. If you spent your Gor coins elsewhere then restart the game.
You *need* the compass) The second way is to step on pad #2 which closes
pit #1 and pit #2. It may be possible to run over both (momentarily) closed
pits and grab the flask on the run, but I haven't tried it yet. Otherwise,
you're pretty much stuck between the two pits.

At any rate, getting the flask should be the *last* thing you do before
you leave the level. Should you fall down the pits or have to climb down,
you are put in an inconvenient position on next level.

>Going down any path to the altar closes the wall behind you.

Lifting the item off the alter and then replacing it opens the
closed wall.

>I went down the "ku" path and found myself dealing with some floating

Be careful about those paths, on some of them you get teleported away
after travelling a few squares.

>You are only a corridor length away from an altar to bring back your skeletons.

Its still better not to die, you lose some health permenantly when you
are resurrected.

>Warning on the wall says "No Fireballs" and means it! They are turned
>back on you immediately.

Depends where you are on that level. They have wierd behavior at any rate.
You can safely fireball something that's standing next to you however.
(btw, its not just fireballs, its all projectile weapons and spells)

>I ran into some knights that make DM I knights
>seem like they were already dead.

Yeah, CSB knights are pretty wimpy compared to DM knights, but those
"Jawa"-wizards have gotten much tougher. I've already encountered 2
dragons, but they seem to be a shade weaker than Charbrol.

>You don't need to have DM I to play this, but you definitely need the
>knowledge and the saved team (with lots of attributes).

>Where is the water?

Its around, but its scarce. Make sure you get completely filled up on
the level below the first one. (and make doubly sure you get the water-
skin from the "supplies for the quick room")

>under TOS 1.4?

I used UniTerm with the May 1988 Beta version of TOS1.4 a lot without
problems (mid 1988, till I noticed that nobody here was really interested).
I would be supprised if anything serious changed after that
(one problem that did exist at that time was that the memory allocation
of the file selector was even more broken than under previous TOS
versions). Anyway since TOS 1.4 doesn't actually exist in the german
speaking part of Europe, there's no way that I can check on this.
(Not that I would do anything that would imply that I think Atari has
any future at all)

On this note about laser printers and types of paper, has anyone tried putting thick paper through a laser printer? I was in a store, and I saw people make their business cards with calamus on paper as thick as business cards are, and then just cut them up. I would be terribly worried that this would damage the printer, but they don't seem to have a problem. Doesn't this void the warranty?

4277. fractals 4 real-time

Newsgroup: comp.sys.atari.st
Date: 1989-12-17 06:02:17 UTC
From: ssingh@watserv1.waterloo.edu
Message-ID: <412@watserv1.waterloo.edu>
Source record: 245551
Cross-posted to: rec.games.programmer,rec.games.video,comp.graphics,comp.sys.ibm.pc,comp.sys.amiga,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.cbm

The following is a transcript of a letter from Loren Carpenter dated April 18, 1989. It details the use of fractals for real-time graphics rendering. I thought it might prove interesting to those who are also working on their own implementations of these algorithms. I have Loren Carpenter's acknowledgement of this posting.

Relative to the fractal game algorithms...

Neither I nor anyone at Lucasfilm ever published anything, as far as I can remember. I did the one for Rescue and the folks at LFL adapted it for Eidolon and Koronis later. Ballblazer doesn't use any fractal code.

The algorithm is the simplest possible midpoint subdivision, subject to the constraint that the landscape be consistent from frame to frame. The random displacement is derived from 2 bits (sign & overflow) of the 8-bit sum of the tags on the ends of an edge.

```
if overflow then
displacement = 0 /* bisect the line */
else
if negative
displacement = -edge_length/4
else
displacement = edge_length/4
```

The landscape is a 16x16 mesh of edges, repeating forever over the plane.

There is a lot more detail, especially about perspective, but I'm not sure LFL wants me talking about it yet.

Loren Carpenter

Post Scriptum: For an in-depth treatment of fractals for graphics rendering, see Communications of the Association for Computing Machinery, Volume 25, Number 6, pages 371-84.

The "...constraint that the landscape be consistent from frame to frame..." may refer to the idea of pixel replication as seen in games like Afterburner and Outrun. Note that as an object gets larger, it also gets blockier. Fractal code can appear to create detail very efficiently, making the object appear more complex than is otherwise possible. This can also be seen in the player vehicles in Ballblazer.

Regarding perspective, two main techniques have been used in the past that I have noted. One is to use different shades of grey for mountains of

different distance, and gradually change colours as the player moves closer
or farther away. The other is most noticeable in Rescue on Fractalus,
where there is a mesh that converges in the distance on a vanishing point.

John Townsend answers my question:

>> If Atari has such a low opinion of the "end users" who buy their machines,
>> and can assume that 90% of them only want to run programs, not write them,
>> why has Atari traditionally supplied a *programming language* with the
>> computers..?

With a question:

>And there are manuals available for programming in ST BASIC available from
>Customer Relations and your local Atari Dealer. So, what's the problem?

Well, the problem is not manuals for ST BASIC... the problem is that KenB
has just told everone on the Net that they aren't worth Atari's time or
effort, since they aren't "professional programmers", and besides, Atari
knows they don't want to program their computers, only "use" them...

So why does Atari hand out a programming language, if they "know" that
no one wants to program their computers..?

I haven't seen a manual for the new version of ST BASIC, but the manual that
came with my original version of ST BASIC was actually quite complete and
well written... and seemed to be aimed at encouraging the new computer
owner to learn to program his ST.

So why are we now told that only "professional" programmers are worthy of
effort on Atari's part..?

>customers. I can stand bad support, but that's outrageous! I'd rather not
>a computer from a company that does stuff like that.

Consider that the *cheapest* IBM clone board comes *socketed* for easy memory expansion to the maximum RAM the system can utilize...

Then consider that Atari could have socketed the Mega ST2 for easy memory expansion for less than $1.00...

Then decide for yourself what Atari's reasoning is...

Sounds like you could use a good hintbook..! :)

What you need to do is to put a Fluxcage on all four sides of the Dark Lord
and then use the "Fuse" option of the Firestaff on him...

Notice that he almost always moves forward in the direction he's facing..
then prepare four fluxcages by standing a square back from him, and spinning
around in place, putting a fluxcage in each direction...

Then step directly back from him, and wait for him to step forward into
the open space in the middle of the four fluxcages...

When he does, Fuse him...!

It may take a few tries, and of course, remember that he's going to be
throwing everything he's got at you... but you should be able to get him
in the end...

The Abacus GEM book seems to have been done that way. However, the
Sybex GEM programming book is quite good, was written in English and
not translated. I've never seen the other GEM tutorial book recently
mentioned, but I doubt it's just a bad copy of the Atari development
docs.

Which of these 3 have you looked at?

Also, I haven't read the Mark Williams C or Laser C manuals, but the are
reputed to be pretty good.

>... How about a team of ST programmers getting
>together to analyze TOS 1.4, and publish their specs?

Funnily enough, I was thinking along similar lines a few days ago! Since
it seems that we have a lot of TOS and GEM gurus reading the net, why doesn't
everybody write in and contribute information (uses, bugs etc etc) on all
the functions on the ROMs (not just 1.4 necessarily)?
I don't think we need to produce full specs for the ROMs, which would probably
take too long anyway, but specs for the standard library functions would be
really good. (I mean GEMDOS, BIOS, XBIOS, LineA, VDI, AES).

4289. Chaos Strikes Back (CSB) bugs?

Newsgroup: comp.sys.atari.st
Date: 1989-12-17 17:00:07 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <10354@stag.math.lsa.umich.edu>
Source record: 245563

Well, after a few days of intensive playing I think I've noticed a few bugs.

Crash - while going down a flight of stairs, the game crashed with two
bombs.

Glitch - after a save, there appeared ~8 squares of multi-colored badness
indicators across the name, sleep and disk buttons. They cleared
up and normal play resumed after switching screens.

Oddness - Fireballs stopped working. This has happened to me twice. Both
times it was while entering the room with the spider critters.
I cast a fireball, it appears on the screen in front of me,
it disappears, a few seconds later the sound comes but no monster
appears to be affected and no visual effects. You can enter this
room from the room with the humanoid-blue-insect-people. However,
fireballs only seem to break when you enter the room from the
opposite direction.

Any confirmation on these?

This doesn't really supprise me since depending where the crash happens
a lot of stuff might not be (yet) in a state the desktop expects. Does
NewQueue do anything odd with memory allocation? UniTerm grabs all
available memory - 5k* (or whatever you have in the setup file) and
sometimes it seems as if GEMDOS memory allocation gets slightly confused
(which is not news to anybody).

Simon

* This is for the fileselector which doesn't check for enough memory
before it runs (I increased the value in on of the later revs because
the 1.4 fileselector needs a bit more (at least it did in the beta test
version).

I am interested in trying out some desktop video on
either an Amiga, or an Atari TT (or an Atari ATW).
Currently, I own neither of these computers; in addition
I know very little about desktop video.

I do want to try generating computer animation to combine
with real-life video.
Secondly, it would also be nice if such a system could
mix two video signals (from two VCR's) into one.
The computer could perhaps control how the mixing is done.

My first question is what types of Genlock are available
for the Amiga, and what do people recommend (referals to
magazine articles are welcome).
At first glance it seems rather confusing, as the prices
for genlock devices range in price from $150 up to about $2000.

I am also unsure of what computer platform to choose.
Beside the Amiga, other choices I can see are:
- Atari STE/TT (provides a color palette of 4096),
- Atari ATW (provides 16 million simultaneous colors),
- Mac II (provides 16 million simultaneous colors).
If anybody has any information on connecting a Genlock device to
any of these machines please let me know. Thank you.

4300. Blood Money and floppy drive speed

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 05:36:13 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891216.15455826.040600@SFA.CP6>
Source record: 245574

Hello all,

I read on the net that drive speed can have an effect on Blood Money, the real version, not the magazine version. Using QuickIndex 15, I noticed that my RPM was constantly at 301. Surely Blood Money couldn't be thrown by THAT?!
Well, it was. I took the drive apart and tried to lower the rpm with the potentiometer inside of the drive but Blood Money seemed to not notice anything. I checked the drive's speed qith QuickIndex15 again. Drive rpm still hovered at 301. I guess the pot has a VERY limited range.
To test things further, I temporarily replaced the drive (Mega computer, by the way) with an old wheezing Epson mechansim (rattles, bangs, and thrashes). Weeeeelll, it booted up Blood Money just fine.
I returned the original drive and decided to fool around with the idea of placing some sort of weight on the flywheel. Using SuperGlue and a dime, I glued the dime to one side of the flywheel's center. After only a few minutes of potentiometer adjustment, I was able to get the drive down to 300rpm!!! For confirmation, I snapped the dime back off and tried to adjust again. Nope, I never was able to get the rpm rating down to 300. Regluing the dime onto the flywheel restored the 300rpm speed. Blood Money now boots fine.
Ok, well, that is fine and good, but I'd have preferred an 'electronic' method. If anyone can suggest another means of correction that is less of a hack, let me know. Also, can the dime's weight cause undue wear on the flywheel?

>put that rumor to rest...

Come on Bobbie, lay off. You're reading too many spy novels. Why would Atari only produce a few Megas that couldn't be expanded, if they wanted to prevent people from upgrading? Why not produce a lot of Megas that couldn't be expanded? There are plenty of plausible reasons why some Megas were produced that couldn't be expanded, without it being a conspiracy by Atari. Maybe they started getting their MMU's from a different supplier, and it turned out that the new MMU's were cheaper because they could only handle 2M of memory. As far as the whole memory debate goes, if Atari wanted to make the 520/1040/Mega line nonexpandable, so what. They're not holding a gun to your head making you buy the computer. I don't ever recall hearing Atari say that their computers could easily expand to use more memory (at least not until the STE and TT were announced.) Other manufactures do much the same thing. Oh, sure, you can expand their memory, but why is it that Radio Shack computers need Radio Shack peripherals? Why is it that Apple computers need Apple peripherals? And why is it that Apple and Radio Shack peripherals are always more expensive than comparable Atari peripherals? Every computer has its trade offs. You name any computer, and I'll tell you it's trade offs, compared to an Atari ST. I don't really mind your comments against Atari, though I don't think this newsgroup is always the right place for your complaints. What I do mind is the way you always make it sound as if Atari personnel sit up at night thinking of new ways to screw the public. That's not what happens. They work their butts off producing an affordable machine. Maybe one day they will have enough stock to start really supporting the USA...

I don't know, if any source code control system is working on the ST.
But I have RCS 4.0 (Revision Control System) running under OS9 ported by myself.
I don't think it is to hard to port to TOS. (You can of course switch over
to OS9 on the ST, but most people like waht they are used too. (This easyly
expalins the sales of MSDOS - machines))
The Source of RCS is available from the Free Software Foundation, which distributes the GNU
- Software.

>useful information. The Abacus publications (which I don't have myself)
>also look pretty good.

The first editions of most of the Abacus books (the ones I got, sigh)
were fairly riddled with errors (which, rumours had it, reflected
errors in the Atari 'developers' kit -- since a number of the earlier
3rd-party books contained the same or similar mistakes I find this
believeable.) They are (at least almost) all now in 2nd or 3rd
revisions, so may be better.

I presently swear by Katherine Peel's 'The Concise Atari ST 68000
Programmer's Reference Guide' (but get a 2nd or later revision, first
didn't include any sort of index) and the 3-volume series by 'Compute'
(on AES, VDI, and TOS respectively).

4306. Automatic window activation - pros & cons?

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 12:47:53 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <1919@syma.sussex.ac.uk>
Source record: 245580

The disk cataloguing program STDCAT has a feature which I quite like - I wonder if it's worth implementing more generally. It's called 'auto newtop' in the menu bar, and when it's activated the window under the mouse pointer automatically becomes the 'active' window.

What do you think? Would this be a desirable feature to have in the desktop (or in an alternative like NeoDesk)? Clearly there would be some overhead in display update time, and there may be problems with overlapping windows if your mouse pointer strayed into an unwanted overlapping window on the way to the one you want. But would it be worthwhile to implement (as a user-selectable option, of course)? Would any existing programs break if 'auto newtop' were installed on the desktop? Would it be a nightmare to write in a way that would cope with every contingency (unlike in STDCAT, where it's in a single program environment)?

Sorry - I'm not volunteering to try to write this. I'm just interested to see if anyone else thinks it would be worth doing.

Graham

Actualy, it can copy up to 65535 bytes if you change:

while (--count >= 0)
into
while (count-- != 0)

While the parameter passed to memcpy is usualy documented to be just an
int, it's not uncommon for versions of memcpy to treat the count variable
as an unsigned integer instead which doubles the amount to memory that
can be moved with a single call...

(Before you use this, be sure your code isn't going to have to deal
with copying negative numbers of bytes... only 1/2 :^)

>
> This has been confusing me for a while, as K&R (surely correct!) would
> seem to indicate that this is indeed permissible!

(Assuming that the '$' character in the line after main() is really
suppost to be a '{' character on your machine and just got garbled...??)

Can you please tell me where in K&R this example is used?

The problem is because you can't assign a string to an unknown size
array at runtime (at least not that way)... The array you give there
needs to be defined with:

```
static char fred[] = "Some string constant";
```

Defining the array as static tells the compiler you want the array to
be created-and-initialized, as-shown, at compile-time.

To assign the array at runtime, you've got a number of options, but the
easiest way is:

```
main()
{
char fred[22];

strcpy(fred, "Some string constant");
<rest of routine>
}
```

> that's a good idea. I should try it. I didn't think it was possible though,
> as struct names are just pointers to memory locations of data, just
> like arrays,

Nope. A struct name is the name of a structure. It is -not- a pointer
even though it has an address that you can obtain by using: &structname
(Note that the address you obtain (unless you cast it or store it into a
pointer of some other type) still "knows" that it's pointing to a struct
so if you use *(&structname) it references the original structure, not
just the 1st byte in the structure.

*(unsigned char *)(&structname) would give you the structures 1st byte...

> and you can address the 5th byte of a structure with
> *(structname+5) just like arrays.

Nope.... *(structname+5) is an illegal construct. You can't increment
a structure itself and contrary to your assumption, a structname is -not-
the same as a pointer to a structure.

On the other hand, ((&structname)+5) (which is different) would point
to a location 5 STRUCTURES higher in memory than &structname. In C, any
addition to a pointer is taken as increasing the pointer by (the value
added multiplied by the size of the object being pointed at (in this case
a structure)). This sometimes causes confuses because many people
normaly only deal with arrarys of characters (so the sizeof object == 1).

Example:

struct foo
{
int foo_1[32][100];
};

foocpy()
{
struct foo src, dst;
```

```
/* if your compiler allows structure assignment, */
/* the next line should copy an array 32 x 100 */
/* integers long with a single assignment... */

dst = src;

/* individual elements would be referenced as... */

src.foo_1[23][7] = 2619;
}
```

4312. MS-DOS emulator with 80386SX

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 13:57:21 UTC
From: focke@gmdzi.UUCP
Message-ID: <1811@gmdzi.UUCP>
Source record: 245586

In a german computer magazine (c't 1/90) I found the announcement for
a MS-DOS emulator with a 80386SX processor.

Some information:

16 MHz 80386SX
16 MHz 68000 (option: 8kB cache - your ST will be 70% faster)
1MB memory (80 ns) (option: 2MB on board, 8MB extern)
1 AT slot (EGA-card ...)
MS - DOS 4.01
Processors are able to work parallel. The 386 is able to support the 68000
RAM is useable in ST mode (RAM-disk or memory extension)
80387SX optional
directly connected to the bus
supports harddisk, floppy, monitor

Available in January 1990. It will cost 1898,- DM (1000 $ I think)

by Omega Computer Systeme GmbH
Oeltzenstr. 14
3000 Hannover 1

0511 / 17294

I don't know anything more about this machine. Don't ask me, if you want
more information.

I hope, that is a product, that will be available in January 90, not in
Dezember 1992.

I remeber MEGA ST, TOS 1.4, Supercharger, ...

Stefan Focke (focke@gmdzi.UUCP)

4313. Those 'crippled' Mega2 ST's

RE: Mega2 ST that are 'not expandable'

I think, in my always unexpert opinion, that those 'unexpandable'
Mega2 STs, the ones which don't have Mega4 memory expansion areas, are
unexpandable only as per the experience of the dealer's tech or
individual attempting to work on the unit.
My dealer has been expanding those STs to four megs with no problem.
Don't know how or if they are using their own expansion board or what,
but they do it.
Regarding Ken and other Atari engineers who have commented on
these units. Remember that these kind folks are engineers, not the
marketing people... Do or die, they have to perform their work the
way the boss man says...

Peripherals for the machines mentioned above are NOT ALWAYS more
expensive than comparable Atari peripherals.

To wit: I paid a total of $1,050 for my Quantum 80S drive with
case and power, adaptor etc... the same drive can be bought
from the same distributor for internal use with a mac for $699.00.
My 1040ST won't take an internal drive.

A friend of mine bought an HP laser for under $1200.00.. you don't
NEED to buy the Apple Laser.

He also has a full page monochrome monitor he bought for $500.00
There's a full 2 page monochrome monitor with software et al
available for the MAC for a LIST price of $899.00.
COmpare $899.00 with $1900.00 for the MONITERM which only runs on the
megas.

These are only a few examples.

Fortunately, the TT looks like a machine that will allow a
greater freedom of choice in the peripherals market...

Let's hope we all get to see one soon.

>happens. They work their butts off producing an affordable machine.
>Maybe one day they will have enough stock to start really supporting

While it isn't strictly the same thing, I'm collecting CHAOS bug reports and reporting them to FTL (who is here in San Diego). Why? My husband was one of the play testers and spent many, many hours playing CHAOS and tracking down bugs. We are both interested in seeing the kinds of things that play testers miss (perhaps it is due to just using *local* play testers, rather than a broader spectrum of people?). If you want to call FTL yourself, report all bugs to ``Debbie'' at (619) 453-5711. Or write FTL c/o Software Heaven, 6160 Lusk Blvd., San Diego ,CA (forgotten the zip, sorry).

4319. How to know we are in TOS 1.0?

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 17:08:40 UTC
From: colas@modja.inria.fr
Message-ID: <452@mirsa.inria.fr>
Source record: 245593

My question is: what is the LEGAL way to know I am running on an ST with
TOS 1.0 roms from a C program? The only legal way I knew of was Sversion,
but it returns 0,19 on both TOS 1.0 & TOS 1.2

All I have seen is de-referencing the pointer
unsigned char *ROMS_YEAR = 0x00fc0018L + 3L;
which gives you the year of the TOS (on US and French tos it is 0x86), but
this is undocumented, and will surely break on the STe, since the Roms are
not in the same place!

PS: I want to know this for formatting a disk: if it is TOS 1.0, use the
TWISTER assembly code, if not, use the Flopfmt primitive with -1 interleave.

PPS: this is for my PD copier, flip, which detects and kills viruses when
copying disks, which is I found the best time to catch them!!! I never get
infected anymore.
(moreover it searches for calls to Flopwrt in the boot sector, catching
virtually ANY new boot sector virus to come)

4324. writing gem programs

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 18:44:01 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <1879@calvin.cs.mcgill.ca>
Source record: 245597

I am quite a beginner in writing gem programs, and would like to start out by translating a program written in standard c so it will have a nice pull-down window menu.

The way I usually start out learning something new is by running a working example and then fiddling around with it. The examples included with laser C don't run "as is" - and sometimes call functions which aren't documented... Could someone mail me the sourcecode of a program which does compile under laser c and does all the aes_init and menu_creates (nothing fancy - I want to start out small and then add stuff to it myself)...

thanks in advance...

The AES does all the resolution fix up during the boot up
time or at the request by the DESKTOP. There is no legal or illegal
way to change resolution and be able to notify the AES about the
change.

These are bugs, all right. As one of the playtesters, I can tell you that FTL is very careful and particular about *any* odd behaviour, let alone blatant bugs like these. You should report this to them. Make sure and mention your machine type, TOS release, and and hardware mods. I've never seen either of these....

>Oddness - Fireballs stopped working. This has happened to me twice. Both
> times it was while entering the room with the spider critters.

> fireballs only seem to break when you enter the room from the
> opposite direction.

That's not a bug, it's a feature. Ask the oracle.... This is the KU (fighter) path. You didn't think you could use magic to conquer the fighter path, did you? :-) Fireballs don't work here, and on the level above with the insects, they aren't effective near you. They are also dangerous in the "No Fireballs" section a few levels down.

This is a great game! As a playtester, I've logged close to a hundred hours so far, and have only completed 1/4 of the game! Good luck in the maze (heh, heh :-). I've been all the way through the KU path, and part way through the others, so if anyone needs some help (that the oracle doesn't help with), feel free to ask.

From: michaelv@watzman.UUCP
Message-ID: <1663@watzman.UUCP>
Source record: 245501

From article <15308@laurel.athertn.Atherton.COM>, by alex@athertn.Atherton.COM (Alex Leavens):
[alex asking for a source code control system for the ST]

A port of Walter (?) Tichy's RCS for the Amiga was recently posted to comp.{sources|binaries}.amiga. Unfortunately, all the sources were in RCS files, and I don't have an Amiga to run the binaries.
(Besides, two of the source parts were missing, anyway... 8-{)

If anyone is doing such a port for the ST, which IMHO should not be too difficult, lots of us would appreciate a release to the c.{b|s}.a.st newsgroups, I think.

>very few Mega ST2s can't be upgraded...?
>BobR

Look, you certainly weren't complaining when you found out that certain
Mega ST2's actually already had 4 Mbytes of RAM, so why are you complaining
when certain Mega ST2's are locked at 2 Mbytes? I personally don't recall
internal memory expansion being an advertised option on any of the Mega ST
computers. And there are real world problems which can crop up and leave
Atari stuck with strange components which make it impossible to make those
upgradable Mega ST2's. So stop hassling Ken B., who has no responsibility
for any of this, and find something better to do.

Thanks.

>Hello, I would like to know where the FTP'able Atari ST stuff is.
>What is the FTP address?

I also would like to know what archives are currently out there. I have found drsgsun (GNU C and Minix stuff, 129.22.16.2) and comp.*.atari.st archives (server), but I am looking for the PROGEM articles, and also the Minix ST serial port driver, and I did not find either of these in either place (kermit for Minix ST was at drsgsun, but it appeared that it required a driver that was not in the archive).

Mistakes not to make department: I ftp'd mg2a from drsgsun (mg.tar.Z), uncompressed it on a unix (ultrix) machine to see if the ftp had transferred the file correctly and to figure out how to "untar", and then compressed the file again for transfer to my ST, only to find that Minix could not uncompress it because I had not used the option -b13 in compress on the ultrix machine. Question: is there a compress for minix which removes this restriction? (if not, I just have to retransfer down the corrected compressed file).

Thanks,

4333. Sig Hartmann Goes to Televideo

Newsgroup: comp.sys.atari.st
Date: 1989-12-18 22:18:36 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <33294@ucbvax.BERKELEY.EDU>
Source record: 245506

From Dec. 19, 1989, Bay Area Computer Currents, pp.8

Sig Hartmann, Sam Tramiel's right hand man at Commodore and Atari and one of his oldest friends, has left Atari for a new job as executive vice president at Televideo.
Hartmann says there was no animosity in the departure from Atari, prior to his November 1 resignation.
Hartmann says he was approached by Dr. Philip Hwang, chairman of Televideo, to help rebuild his struggling company. Hartmann says he jumped at the chance to turn around Televideo. "The opportunity's not just financial but the satisfaction of being one of the key guys to take a company which is losing money -- down hundreds fold -- and turn it around. That's exciting."
Televideo, which five years ago was making $170 million on terminal sales, now faces a sea of red ink. Hartmann plans to use the Atari formula to bring back the company's fortunes. "My pnals are to run a lean, lean, lean organization."

--Wendy Woods, NewsBytes

[Now I wonder: If Sig wanted to turn a company around, why didn't he stay at Atari? Sure, it's making a small profit now, but they have the potential to make some big money and market share if they are willing to take some risks.]

[Isn't Philip the heir of the TV fortune? I understand that he is no marketing genius like his father was.]

> UNIX RCS system, and plan (in my copious spare time :-) to start porting
> it to the ST. Anyone have any suggestions/comments/etc. to make about
> conventions I should follow, or other, similar things?
>
> For example, I think that things are stored in RCS in the form
> <filename>.c,v
> which is fine for Unix, but...well, you know how the ST is. I'd planned
> to change this to
> <filename>.c_v

I don't think this needs to be done. When unsharing the amiga files on the ST, everything with foo.c,v worked well. But we should consider what is to be done with long suffixes, i.e.
foo.sh,v becomes foo.sh, , and what becomes of foo.bar,v ???

Anyway, it's good to hear about your efforts.

Michael

>Has anyone else had a problem with the scrolling that Gnuemacs 18.51
>does on the Atari ST. The problem I have found is that when the screen
>scrolls, the status bar also moves and gives the appearance of an a
>window shade. Does anyone have an idea what this might be. Some said
>something about the termcap I am using.

The problem did have to do with the termcap, however, there was also
another catch to it. First to stop the"window shade scrolling" delete
the insert line (al) and (dl) entries from the termcap and save the
file. However, this only resulted in GnuEmacs saying the termcap was
not powerful enough because it couldn't position the cursor. What I
didn't know was that the ST saved files in most editors with a CR and LF
and that GnuEmacs wanted the termcap saved with only LF (0x0d), the extra
CR (0x0a) was confusing the termcap reader in the editor.

To solve this problem, I created a filter in 'C' that will remove the
LF's from the termcap file. Its been working fine since.

Thanks for the prompt replies,

>your booting up with floppies. You would have to put a desk accesory and data
>file on every disk you wanted to boot up with the new icons.

<Blush>. Thanks. However, you probably have a very early version of the
loader--I re-wrote the loader later, to make it a lot faster. First, if
you haven't changed your desktop configuration on the boot floppy, then the
loading is instantaneous, because I now save out the previously searched-for
load address. In addition, if you have changed things, then searching is
a _lot_ quicker. I used to use the old 'word-at-a-time' search algorithm;
I now use an algorithm from the Computing column in Scientific American.
The algorithm measures the offset from the base of the string search pattern,
and then sees where the search failed--you can then skip ahead _at least
that many bytes_ before checking again. It's a pretty hip algorithm (I can
dig up the specific reference if anyone's interested), and it's a whole _lot_
faster than linear searchs, especially for fairly large search patterns on
large amounts of memory.

However, the *cheapest* IBM clone still only knows about 640K of memory
max (8086 based here). Without an *EXPENSIVE* memory board in one of the
card slots and some driver software 640K is all you'll ever get to use.

Of course even on a 80286 computer w/ say 10Megs of RAM MS-DOS still sees
only 640K (we tested one under windows once for memory use)...

#
# The quick answer is this: the system variable _sysbase (at address
# 0x4f2) contains a pointer to the base of the OS. The OS starts with a
# header which identifies it. At offset 2 and 3 into this header are two
# bytes: the major and minor revision numbers, respectively. Original RAM
# TOS, as well as the first cut of ROMs, was, I believe, 1.0 (that is,
# major byte is 1, minor is 0). The Mega ROMs are 1.2, and the new
# release will be 1.4. You aren't missing revs: we're jumping them by two
# for reasons I don't want to go into now.

4342. Good Articles are Hard to Find

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 01:01:56 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <33296@ucbvax.BERKELEY.EDU>
Source record: 245516

Recently, there has been a little interest in archiving some
of the better articles on comp.sys.atari.st. I'd be willing to put
together a short anthology of such articles. I'm not sure how I'll
do this since I've never sone something like this before, but as they
say at wherever it is they say whatever it is they say, "what the heck!"

Here is what I forsee as the First Book of Good Articles:

* It will come in several formats including but not limited to:
. UNIX compressed tar archive, with a collection of troff formatted
files.
. ARC of ascii files.
. One long file that will print on line printers, paginated.
. PostScript, compressed tar or ARC.
. Maybe TeX instead of troff if I ever bother to learn TeX.
. Maybe in some Desk Top publishing program if I can get my hands
on one.
. Maybe a photocopied version sent by US mail.

* Maybe graphics. It depends on how complex I want the project to be.

* Not less than ten articles.

* A cool sounding title.

Here are the rules for submissions:

* The first deadline is January 30, 1990. I go off for holiday between
Dec. 20 and Jan 16, maybe longer, maybe not. So I'm just going to let
my mail spool grow for a month.

* Submissions should be in ascii format. If you have a troff or TeX file,
tell me, but don't send it. I don't know if I want to deal with special
formats at the moment.

* I reserve the right to change spelling, grammar, syntax, and formatting
without notice. Unless you explicitly state that your document is not
to be combined, merged, or integrated with another document, I reserve
the right to do so. You may indicate if portions are to remain unchanged.

* I will mail out an ad hoc release form before putting the book together.
I don't know how legal the form will be but I will try.

* All contributors will be credited.

* All submissions remain the property of the original authors.

* I reserve the right to distribute all the writings as a collection
in electronic and paper formats. I reserve the right to charge
for media, duplication, and labor, for any distributions requiring
media, duplication, and labor, such as diskette mailings or
paper copies.

* I will encourage the copying of the collection as a whole, and
any article which explicitly states that it should not be copied
inexpensively will not be included.

Topics I'm interested in seeing:

1. RAM upgrades.
2. Hacking the display.
3. Things to hang off the cartridge port.
4. Alternative mice/alternative input devices.
5. How to write handlers for strange devices.
6. Fixes for the monitors, console, mice, etc.

?. Anything else you think is pertinent.

Other notes:

I think this book will be a mostly hardware book. If the
software oriented articles start to flood my mailbox, I might
come up with a separate book for that. But maybe I'm thinking
too far into the future.
Although I have reserved the right to charge for the
book, I will email it to anyone who asks for free. I will charge
if I have to send out a diskette or a hardcopy version. But I'll
try to keep it down to something like $5 in the USA.
Remember to write to your audience. I don't know what the
level of the audience is, but I'd aim at the "weekend-programmer'
or "kitbuilder" crowd. They are comfortable enough to write
programs and do minor repairs or modifications, but also want
clear, detailed docs because they don't know enough about the
ST (or maybe about computers) to confidently debug mistakes or
fill in vague points in your docs.

Send comments, articles, and suggestions to

kawakami@ocf.berkeley.edu

and remember that I'm on holiday, so I won't be reading anything
for nearly a month. Good bye and happy hollidays.

John Kawakami kawakami@ocf.berkeley.edu

4343. Re: Stacey Display

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 04:00:07 UTC
From: dsmall@well.UUCP
Message-ID: <15091@well.UUCP>
Source record: 245517

The base message asks about the Stacy display, and if it's bad.

I've been using a Stacy4 since Comdex 1989, a month ago. I've
put it to a variety of uses.

The Stacy4 display is about the size of a Mac screen. It is backlit
and VERY usable in dim list (try that on Mac portable). The contrast
allows adjustment to extremely readable, and even side-to-side reading
has a nice, wide angle.

Because LCD's aren't, it is not superfast, but that isn't a problem.
The much ballyhooed 'lose the mouse' is easily remedied by just wiggling the
mouse slowly and picking up the motion with your eye.

On habit that you have to fix is while text editing. The temptation
is to move the cursor with mouse to the area to fix, then press RETURN,
instead of the mouse button, to set the cursor there. I don't know why--
I use a Mac all the time -- but I and one of the Codehead people ran into it
immediately. Still, it's training.

I have the 4 meg RAM / 40 meg hard disk version. The hard disk is
a Conner and no slouch at all. However, frankly, don't run it off batteries;
this is dynamic RAM (Apple uses VERY expensive static) and dynamic is a power
hog. Atari is trying -- they have a utility that powers down the HD when it
is not in use.

About the only peeve I have with the machine is the space bar requires
more effort that the rest of the keys, and when Sandy is asleep next to me,
I hate to whack it as hard as it needs. So sometimesmywordsruntogether.
This may just be this particular keyboard.

In any event, I own both a Toshiba 1200 HB (backlit, HD, MS-DOS)
and the Atari Stacy. I find the screens equally readable -- thank heavens
for backlighting! -- and I am using the Atari more and more as I gain
confidence in it. It seems 100% compatible, with the exception of a now being
fixed HD bug (minor, and you won't see it), and while it's heavy, try the
twin floppy model -- not nearly as bad. And the best news of all, it passed
FCC as Class A, so you can buy it. (You might want to talk to a developer,
who gets them at half price .. hint hint.)

The machine has been extremely reliable for me. I can't recall a
crash. It also works extremely well in Mac mode with the GCR; the drives are
Epsons and have no ringing problems we can see. Hence, any time I need to
shift to Mac mode, it takes 20 seconds.

Internally, the 68000-CMOS is covered, after about 1/4" clearance,
by a power supply unit that mystifies me. A friend tells me that it's

necessary
to drive the electroluminescent display at higher voltage; I have no way to tell if
that is true. I expect adding a T-16 is possible *barely*, but PC-Ditto II might be
a real bear.

Anyway, I've been typing and hacking and hammering on it for a month, it's held up fine, and the display is as comfortable for me as the state of the art in Toshiba. Furthermore, I was told the price of the 4/40 would be $2500, so I can get around 3 of these for one Mac portable. I ain't complaining.

Now that the FCC hurdle is passed, I strongly feel Atari has a real winner here. MIDI people are drooling at the prospect of a portable MIDI driver/sequencer. The drive is rugged; by accident, I carried it through the airport on, and not a bad sector showed up. Try that on a Toshiba... :-).

Well, enough rambling. I think it's a winner. Battery life is never going to thrill you; I may research Gates lead-acid cells. Don't go 4 meg and HD if you want to run batteries; they go flat in *15 minutes*.

But in terms of an easy to use portable, I really like it.

I've taken the time to ramble a little because many people have not yet seen a Stacy and few people have posted any long-term impressions. If I couldn't stand the display, I wouldn't use it, and I would call it very usable.

-- thanks, Dave / Gadgets

4344. Re: SYQUEST REMOVABLE DRIVES10643

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 04:07:13 UTC
From: dsmall@well.UUCP
Message-ID: <15092@well.UUCP>
Source record: 245518

The basenote concerns Syquest 4 megabyte removable drives.

I just got done reviewing two such aftermarket units and I used
the Atari Megafile 44 at Comdex demoing Spectre. I can only say I wish
someone had told me about them earlier; I would have bought more. As is,
after testing, we went and bought four more from the manufacturer, hanging
them on Mac II's, ST's, and whatnot.

I am incredibly impressed with this unit. It's the single most
positive review I have ever written for a product; I could not find anything
wrong to say. (People are going to think I was paid off or something!)
The drive is incredibly fast; it walks all over a hot Omti 3527 / Mitsubishi
RLL 60 meg drive, which was my fastest. It is extremely portable; we switch
disks around the office all the time, never a problem. It has never ONCE
glitched us. Furthermore, it is tough beyond belief. When the review
units arrived from START magazine, they were crammed full inside with
those peanut-packing-pellets. This wasin the critical head area, the
superclean
area! We vacuumed it out, and the drive failed to work.

Next, we reopened the drive, found more packing pellets jammed in the
seeker circuitry, and cleaned them out; the drive could not seek to track 0
because of them. The drive started working. That's beyond belief; every
other hard disk I know of would have been fried with all the fragments of junk
in there.

We have never had a problem in moving platters from drive to drive.

The Syquest drives are now our primary development drives,
eclipsing the Mitsubishi setup that frankly cost more. They are SCSI and
a snap to hook up with an ICD interface. Both Toad Computers and
CarterGraphics
in UTA sell them;
I really can't recommend them more. All I can say is, why didn't someone
tell me about them before?

-- thanks, Dave / Gadgets

p.s. A correctly Macformatted Syquest goes right into Spectre in Mac Mode.
Talk about a handy way to move 44 megs around.

4345. Re: Blitz copy cable and utility

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 04:14:52 UTC
From: dsmall@well.UUCP
Message-ID: <15093@well.UUCP>
Source record: 245519

The basenote asks where to get the Blitz cable docs (which are PD, I think.)

They are available on both the GEnie and CIS networks, and probably interminable BBS's. They're a bit long to uuencode and post here, though.

Also, an outfit in Las Vegas, Nevada is selling the complete unit for a reasonable price. There are starting to be ads for it in mags like ST-World and ST-Informer. In looking, I couldn't find one, but my office is in a Christmas Mess. It's there alright.

Software First, a little north of Bay Area, reports that there is nothing in their store that it cannot copy. That's not surprising, given that's it's just passing on pulses from drive to drive without analyzing them. I know people who mass-format disks with this utility, although I personally do not, as it takes 18 sec/side. I'm thoroughly impressed with it -- and that it doesn't make third and later generation copies, which to me legitimizes it as a backup tool. Software First reports no other copy program can copy everything they have, including Copy II ST, etc, and even the Option Board, which is extremely powerful.

So, if you know someone on GEnie or CIS ...

-- thanks, Dave / Gadgets

4346. Re: GCR vs. Mac Plus

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 04:25:42 UTC
From: dsmall@well.UUCP
Message-ID: <15094@well.UUCP>
Source record: 245520

This must be my night for notes.. *grin*

The basenote discusses speed differences between the Mac Plus and GCR.

One problem with marketing an "emulator" is people think it's
slow. They see the CP/M emulator, PC-Ditto, and whatnot. The difference
is running native 68000 machine code vs. interpreting 8080 or 8088 code.

The ST runs at basically 8 mhz; the Mac basically also at 8.
(plus or minus just a hair). Problem with the Mac is that video contention
chops a good 20% off the processor. As I understand it, when the SE was
designed, the PAL's that handle video contention were cleaned up; that's
why the SEis 20% faster -- it got to where it should be. ApplePeople feel free
to correct me; this is second hand.

I do know in benchmarks at a certain techie MacMagazine, we were 21%
ahead of the Plus in CPU, 4% ahead of the SE, and way behind the Mac II;
however, the II is 68020/30 and 16 mhz, so that's unfair. Amazingly, the
ST's hard disk kept even with the Mac II; the ST's Megafile 30 is no slouch
at all in raw data transfer rate. The ST also uses DMA, the Mac II a
loop-store scheme, so it's an unfair comparison.

The thing that screws up most benchmarks is we run on a 70 hz
vertical blank, corresponding to the Atari mono monitor. The benchmarks on
the Mac run at 60 hz. Since most timer-tick programs dervice time-elapsed
from this vertical blank, they're off on the Spectre. We are planning a 60 hz
VBL "option", if you're willing to put up with desynced screen/animation,
which will bring sound back to normal pitch and make benchmarks accurate
once again, but that's in the future.

Any timings right now should be on a stopwatch, and again,hard disk
access just isn't fair; looping can't keep up with a DMA scheme that plugs in
16 words at a whock. I could make a case that DMA could outrun a RAMDISK.

-- thanks, Dave / Gadgets

p.s. The T-16 accelerator board takes the Spectre up to a "true" 12 mhz.
This makes an amazing difference! Even with the moniterms, with their huge
display memory, screens snap open and shut very fast. Recommended highly!

.

4347. Re: Futher Adventures of ATM & Spectre

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 04:43:58 UTC
From: dsmall@well.UUCP
Message-ID: <15095@well.UUCP>
Source record: 245521

My thanks for the very kind comments concerning Adobe Type Manger and Spectre GCR!

We have also had many positive responses on other systems. Frankly, I'm glad I wrote the software the way I did -- no patch files -- so new products could run after the software was cast in concrete.

I did notice two things I might help with. First, we have seen *some* (not all!!) problems with internal Mega disk drives and GCR. Typically, the innermost tracks, 64-79, do not read properly. This appears to be due to horrific electrical noise inside the Mega. Mark Booth (STACE on GENIE) has extensively commented on how to produce a shield; it takes some thick aluminum,
like cookie-baking stuff, and a few minutes of time. In 100% of cases, he has been able
to fix internal drive problems, and he's up to 20 or so drives now.

Next, MultiFinder is *not* stable, alas, under 2.3K. We have finally discovered why. As you know, there's a big problem with Mac software storing into location 0, a program fault. The stores cause a bus error, a crash I usually recover from. Well, on a hunch, we set the incircuit emulator to check for *reads* from locations 0 and 4, which do not cause a crash. (See, on a Mac, 0-7 are read/write RAM except on powerup; on the ST, they are ROM). Well whoops! Multifinder, through ROM calls, is *reading* location 0, and getting 602e1e00 (if I remember right), then plugging it into various critical memory tables. The result is a crash is not far off.

The solution is to forbid the ROMs from doing that by simple entry checks for location=0 on these calls. Three were involved if I remember right.

This greatly, greatly stabilized Multifinder, and to our complete surprise, MicrosoftWord 3.02. That was the bug in Word (out of memory) that I had been chasing over a year and failed on. Well, it works now.

Anyway, I want to caution you on Multifinder. It is not yet stable on 2.3K. (Note: The "about Spectre" on 2.3K says 2.0 -- our fault.)

We have fixed this in 2.5a, and ran it extensively at Comdex for a week with zero crashes, except for one known-multifinder killer D/A. We would commonly have 5-8 applications going at once.

If you have a strong need for it, we could probably arrange a quick-release of 2.5A. It also features on-line configuration (press HELP and a config page pops up; use F1-F10 to toggle features) and some other goodies. Doug is also rewriting the launcher for some pretty stunning stuff.

-- hope this helps,

```
-- thanks, Dave / Gadgets

4349. Re: THINK C's source debugger and Spectre

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 05:19:28 UTC
From: dsmall@well.UUCP
Message-ID: <15096@well.UUCP>
Source record: 245523

(Sorry about all the net bandwidth -- there have been many Spectre questions.)

T The basenote asks about Think C's source debugger.

While I am not certain, I am under the impression that this setup requires Multifinder. The debugger runs as one task, and the main task as another. Multifinder under 2.3k is fatally flawed due to zeroreads (a previous post tonight dealt with that at length). When 2.5 comes out, with the zeroread patch, please retest; I think you'll have better luck.

While it's true we grab interrupt vectors, the situation isn't that bad. We have to grab hblank, at IPL 4, and serial/keyboard/mouse at IPL 6. The Mac doesn't really use those; it uses 1 for VIA and 2 for SCC. (2 on the ST is hbank, which everyone shuts off). I see it as entirely possible to implement many of the Apple's original vectors through their vector dispatch scheme and bring up stuff like TMON; heck, the Amiga AMAX emulator runs TMON ...

Hence, don't give up hope.

-- thanks, Dave / Gadgets

4350. CSB questions

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 05:19:43 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <10375@stag.math.lsa.umich.edu>

4353. USENET -> GEnie uplink now working

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 06:00:28 UTC
From: dsmall@well.UUCP
Message-ID: <15097@well.UUCP>
Source record: 245527

It's time to announce that there is now a working uplink
from USENET to GEnie. Each note posted into comp.sys.atari.st is sorted
by topic, and uploaded to "Category 10" of the Gadgets RT on GEnie.
The link's been up around two weeks, and there's about 2,000 messages posted
there (we kept a backlog to build a "base").

The link is one way. GEnie makes its living selling information
bases to the public, and doesn't want them downloaded and distributed freely.
There's something about an "anthology copyright" that I don't want to have
trouble with, either. I just want to get the maximum freedom of information
exchange possible between these networks; GEnie could *badly* use the
technical and international information posted here routinely.

I wanted to let you know to prevent invading anyone's privacy.
GEnie acts just like another (receive-only) site, but many people here are on
GEnie as well. I also wanted to advise Atari employees of this. If someone
has a real need not to have their notes forwarded to GEnie, I will be happy
to put a "filter" on to prevent it by request; just email me at this net
address, okay? I don't want to cause anyone problems.

On the uplink, we scan the "subject" field of the USENET note, and
use that to determine what "topic" the file goes into as a GEnie note.
For instance, this enables us to group all Spectre notes together, all
hard disk notes, all TT notes, and whatnot.

While I see little possibility of GEnie notes being downlinked into
USENET (and it's just as well; the GEnie load might overwhelm USENET, and
anyway the cultures are different betwen the nets), I do see a very good
possibility of setting up a 2-way mail link, run through here. I am *very*
open to suggestions on this; I'm no Unix guru by any means.

What I envision, and this would not take too much doing, is having
people send notes to the Gadgets UNIX machine
(at net address !hplabs!boulder.edu!tcr!gadgets!genie), with some sort
of TO: (genie mail address). Going the other way,probably there would be
some sort of GEnie ID to send mail to (why not USENET?), and again,
an addressing line in the note -- TO: hplabs!well!dsmall. I believe I could
handle notes that "bounce back" or flop.

Overall, I have found GEnie management to be quite positive to the
idea of a link, I think there's real hope for 2-way mail. Hacking the link
together took some doing; the primary problem is error-tolerant modem
communications.

Anyway, I would like to solicit suggestions for how to implement mail
(just mail to this address), make sure that if anyone minds having their

replies uplinked, they let me know, and in general announce the net connection.

It seems to me like a benefit for everyone involved, especially if/when 2-waymail gets going.

Systems like Compuserve and BIX could also fairly easily be done, now that the methodology is hacked through; also, other areas on GEnie are expressing great interest in having a USENET uplink. Basically, folks, USENET is perceived as the place where the people who know what they're doing post notes.

Again, GEnie is a read-only site. I'm not dumping the GEnie message load onto USENET; mail is presently not up, but has a very good chance.

Finally, yes, Gadgets does make a percentage of connect time people spend in it on GEnie. However, before anyone starts talking about how we're doing this to basically make money, let me point out that since the Gadgets RT started, *all* profits made from GEnie have been sent *directly* outside the company to the volunteers who maintain the RT, and who are underpaid for their work, in my opinion. I personally am making nothing on this.

Why do it? Because a long time ago, on the CERL site on PLATO, a person named Sherwin Gooch, ex-PLATO, ex-Atari, and now with Apple, introduced me to the hacker ethic and freedom of information exchange as its primary goal. (No, not illegal exchange, you know what I mean). People on GEnie, for instance, were desperate for TT news; it was available here in abundance.

If anyone feels this is wrong, I'll be more than happy to listen and if convinced, drop the link. Likewise, if you think it's an alright idea, don't care, or whatever, let me know.

My WELL address is : !hplabs!well!dsmall,or dsmall@well.sf.ca.us. I don't always get on as much as I should.

My UNIX machine downstairs, where the notes vector through to GEnie, is !hplabs!boulder.edu!tcr!gadgets [!dsmall if you want me]. I'm such a net neophyte that I don't know *if* it's possible to do a dsmall@something for my address, nor how. Heck, I don't know what FTP *is* or how to do it -- but if someone wants to drop me email, or just a pointer on how to do it, I would be grateful.

Well, enough said. I hope this leads to good things -- GEnie users getting good information on time, for instance.

-- many thanks, Dave Small / Gadgets by Small

p.s. You realize I don't yet understand how to handle "prepared file to include?" It keeps showing up at the top of my notes. Oh, for the time to do more...

>hcj@lzaz.att.com

Ah, no. Perhaps the old MWC (pre version 3). Current version mentions
dosound on pp301-303, but mentions nothing abuot producing a specific
sound, just a demo on making sounds and noises of any type. You
(J. Ameij) may want to try the Abacus book, Sound and Graphics on the
St, it may mention how to create specific notes with Dosound (however,
the examples there may be in either BASIC or assembler)

4355. I need info and ideas

Newsgroup: comp.sys.atari.st

Message-ID: <258DD2CB.16730@maccs.dcss.mcmaster.ca>
Source record: 245529

G'day folks.

Our club had a great year last year. We put on some really good shows and we want to do it again. As a member of the executive, I'll request a brain storming session soon. In the meantime, does anyone have any great idea they've seen and wouldn't mind sharing? Or something they'd like to see in a users group? I'd like to be able to give the guys something to chew on after this session, so if anyone can help I'd be grateful.

I haven't done a presentation yet, and since January we plan to slow down a little, organize, regroup and come back good, the prez asked me if I could take care of January. I'd like to talk about upgrades: drives - hard and floppy, memory, accelerators, add-ons, etc etc. I've done a drive upgrade myself, and soldered a memory upgrade, but I'd like to know what else is out there. What brands, addresses, caveats, and things like that. If people have docs and write-ups on anything related at all, I'd love to see it. Docs I could put in the newsletter would be ideal, but I want to write most of that myself.

I'd love to hear from other clubs about what they have found successful and what flopped. I know we had one really bad meeting. We left it all to one guy who promised he could take care of everything. People ended up standing around and chatting with each other instead of doing anything, so I'll be careful. The idea was good - Casino Night. Play card games with computers, and starting with $100, see how much you can make. The winner got to take home some great prizes.

Thanks for any help.

The Mark Williams C manual "Lexicon" is VERY good.. probably one of the most useful references to the ST... also the Compute! Books series by Sheldon Leemon on the AES/VDI is worth tracking down...

The Sybex book on the GEM interface was also very good...

I just wish Atari Corp. had easily available documentation that was anywhere as good...

Kevin Clendenien makes some observations about my comments about Atari Corp's redesigning their printed circuit boards...

Kevin.. if you can think of a reason why Atari Corp would pay circuit board designers to redesign the Mega ST motherboard to eliminate the extra RAM positions, and pay extra to have *TWO* different motherboards produced, instead of ONE, and have to inventory TWO different motherboards instead of ONE, as they used to, ... I'd like to hear your thoughts...

It's always been my understanding of "business" that making one part serve several purposes is more economical... unless you're trying to "force" customers into paying your price for your product...

Why would Atari Corp make *TWO* different PC boards, when it would cost them] more to do it that way...?

Still wondering...

Yesterday I sent a little program *with* *source* to Steven
Grimm that finds out exactly that. It should be posted to
comp.binaries.atari.st and comp.sources.atari.st really soon
now.

The program TOS_VERS shows TOS version number (with date and
nickname (e. g. "Rainbow TOS")), GEMDOS version number and AES
version number. The program is really short and should be self
explanatory. If it is not, an article by Ken Badertscher is
appended that explains how things are to be done. Not to
mention that everything is of course perfectly legal.

4362. Scanners for ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 09:33:00 UTC
From: BALTUCH@BRANDEIS.BITNET
Message-ID: <8912200802.AA15030@ucbvax.Berkeley.EDU>
Source record: 245535

I'm interested in getting a scanner for my ST.
The only one I know is made by Migraph (Federal Way, WA) and comes with
software that converts Easidraw to Degas ("Touch Up").

Scanner + software sell for about $490.

I'd be interested in compiling a fairly complete list of the available
products available either in the US or in Europe, so any answer is
welcome. If can include price, availability and popularity, even better.

I'm totally unaware of what exists out there, what features to expect,
what price to expect and... if this topic has been discussed on the
list recently (I vaguely remember seeing "Scanner" in the list of
topics of various digests in the past few months but as I wasn't in-
terested at the time, you know...)

Any help mucho appreciated.

4365. Making the SH205 silent

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 12:58:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <891219125847.519899@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 245539

I just succeeded getting our (previously extraordinary loud) sh205 silent.

I applied the following modifications to the thing:

- break out the grille (? hope I got the correct word from my dictionary) that covers the fan. This inhibits the noise produced by the air flowing through the grille.

- mount the fan as deep as possible (a few mm) in the box. Slightly increases the effect of the above mod.

- fill the parts outside the shielding (to the right of the drive) with Pritex or something similar do damp resonances in the box.

The amount of noise reduction of these steps is compareable to pressing the quiet button of a NEC P6.

- I replaced the fan by a silent one.

Now our Mega ST is louder than the drive. I think I will have to get a silent fan for the Mega, too. I think, the above modifications which I made a few months earlier are still necessary since they attack completly independent sources of the noise of the drive.

Source record: 245543
Cross-posted to: comp.sys.atari.st,comp.text

I'm slowly getting up to speed on TeX (running on a VAX) and Metafont (on my Atari ST), together with various viewers. Not a guru in sight, unfortunately And the manuals kinda assume the availability of one. So I have a few questions
1) Once virmf has read plain.bas, is there any way of interrogating it on-line as to what the settings corresponding to various modes are?
2) Can anyone tell me the settings for the modes built into plain.bas for the Atari ST (as available on panarthea)?
3) The printing of WEB documents that incorporate changes seems to be MASSIVELY affected by a thing called '\maybe'. I keep finding places where it's set, but noplace where it's either tested or conditionally set. Any help? Any pointers?
4) So I lied in the header..here's something else: I have neither a .DVI driver for my Star NX-1000 nor the connections to support ftp. Any pointers to source or Atari ST executables of (I presume)dvieps? Is some file I already have likely to be a good skeleton to build my own from?
5) (getting weird) My printer supports color. Does the TeX universe?

From: oldfield@bnr-rsc.UUCP
Message-ID: <1616@bnr-rsc.UUCP>
Source record: 245544

```
This is from a friend who doesn't have net-access....
-----------------------------------------------------

Every time I try to update the text in a menu item,
my program crashes. The call I am using to change
the text is

menu_text(menu_ptr, ITEM_CONST, new_text);

menu_ptr - a pointer to the menu tree
ITEM_CONST - index of a menu item
- from the .H file created by a
resource construction program
new_text - pointer to a null-terminated
character string

I have tried using strings that are shorter, the same
length and longer than the existing menu item text.

I have tried putting wind_update(BEG_UPDATE) before
the menu_text call and wind_update(END_UPDATE) after.

I have tried putting menu_bar(menu_ptr, FALSE) before
the menu_text call and menu_bar(menu_ptr, TRUE) after.

I have also tried surrounding the menu_text call with
both wind_update and menu_bar calls.

What am I doing wrong? Please help.

[...]
> If there is enough interest, i could post temacs (that's the raw, undumped
> version), the standard-lisp-files and my postprocessor to relocate the image.

I'd love a copy of this... I've just bought an ST (only 1040, but I'll be
putting another meg of memory in soon), and your offer seems heaven sent !

I put GNU EMACS up at work, and so have all the (original) lisp files already.
Would it be possible for you to send me the other bits so I can get it going
at home ?

I can also send it on to anyone else in the U.K. who may ask for it, & perhaps
send it to the archive servers over here, if that's OK with you. (UK readers,
I'm thinking of Bradford & Lancaster - anyone know of any others ?)

Thanks,
Dave Hines.

>USENET is perceived as the place where the people who know what they're
>doing post notes.

I don't think any Usenet news is available on Compu$erve, but it already
has an e-mail link to the Internet via Ohio State University. In theory,
e-mail to 71234,567 would be addressed to

71234.567@compuserve.com

or (from BITnet or other balky mail sites)

71234.567%compuserve.com@saqqara.cis.ohio-state.edu

Note that the comma in the CIS userid has been changed to a dot in order
to meet RFC822 standards.

From Compu$erve to the Internet, it's

>internet:user@host.domain

John Chew <poslfit@gpu.UTCS.UToronto.CA> maintains a list of internetwork
E-mail methods and posts it monthly to comp.mail.misc and
news.newusers.questions.

Last I heard, Delphi was carrying the Usenet rec.humor.funny newsgroup
(with Brad Templeton's blessing). I don't think it has hooked e-mail into
the free world, even though it would be quite easy -- plenty of other VMS
sites have done so. It does exchange e-mail with other commercial
services.

BIX is not, to my knowledge, e-mail accessible from the Internet and UUCP.

However, Jefferson Software in Phoenix (the Modula-2 folks where kbad used
to work) has developed a program for the ST that allows the transfer of
BIX public conferences into RFC1036 (Usenet news) format, stored in a
standard Usenet batchfile, and vice versa.

It currently is being used to internetwork BIX with several Citadel/STadel
BBS network discussion topics (rooms). I think the software is capable of
dumping Usenet news into BIX, and vice versa.

In article <10062@thor.acc.stolaf.edu>, pritchaj@thor.acc.stolaf.edu (John Pritchard) writes:
> 1) I just got Degas Elite, does anyone know where there is
> an HP Deskjet print driver for it?

If you don't have one, get an account on GEnie . There you will find the program DJ_DEGAS.TTP which will print all Degas file types to the Deskjet. For resolution-independent printing that takes better advantage of the Deskjet's 300 dpi resolution, however, I strongly suggest getting a GDOS driver (such as Neocept's Turbojet). Then you can import those Degas pictures into Timeworks DTP or other GDOS programs, and get better results.

> 2) I have an old version of Publising Partner, does anyone
> know where there is an HP Deskjet print driver for it?

You can pick up a Deskjet driver for Publishing Partner 1.03 from Softlogik's BBS (314) 894-0057.

> 3) Are there PD fonts for GDOS out there? where?
> If not, where is a good place to buy some?

Howard Chu recently converted a lot of Macintosh fonts to GDOS format. You can FTP the set from archive sites, and probably find them on Genie as well. The Fontz program from Neocept comes with some good GDOS fonts, as does Wordup and also Timeworks DTP. With Fontz, you can make your own GDOS fonts, or modify existing ones.

> 5) Anyone had good/bad experiences with Computer Eyes or any
> other digitizing via CamCorder?

I just bought VIDI-ST. It captures and digitizes video images so fast you are actually watching your movie in real time on the ST monitor. It buffers up the video frames, so that when you freeze, you can choose among any of the snapshots it has saved. On my 2.5 Meg 1040 ST, up to 65 frames can be buffered. It is not a true color digitizer, it captures at 16 different shades, which you can then assign a color palette to. For true color, you can get Color ComputerEyes, but this one requires a still image from your video source. The image capture takes 24 seconds if you want a good quality image, and 6 seconds for the lower quality. Process the raw output file using Digispec, and you will get a Spectrum 512 format file that renders your image in true color.

Hope this helped,

Rana Dutt

I cannot tell you for sure about the particular times() function in the
particular library (if I were at home, I could), but the ST's system 'tick'
clock is a 200Hz clock. Try that value out and see if the results
seem plausible.

>tracking down bugs. We are both interested in seeing the kinds of things
>that play testers miss (perhaps it is due to just using *local* play
>testers, rather than a broader spectrum of people?). If you want to call
>FTL yourself, report all bugs to ``Debbie'' at (619) 453-5711. Or write
>FTL c/o Software Heaven, 6160 Lusk Blvd., San Diego ,CA (forgotten the zip,
>sorry).

I'm not connected with FTL in anyway; heck, I don't even own Chaos yet.
Just a gentle reminder, for sake of the good people at FTL, to please be
specific as possible. I know if _I_ were at FTL, one of the following
hypothetical bugs would be ignored (exercise for the reader to guess which):

"I played Chaos for 36 straight hours and then it crashed."

"Thrown weapons don't work properly if you've just used stairs,
and are still standing on the 'landing' when you throw. First
noticed it on the 2nd level, and it is repeatable."

(Not trying to insult anyone's intelligence, but I know from experience that
even intelligent people sometimes send in the most incredibly obtuse & useless
descriptions of their software problems. Better too much verbage than too
little, in this case.)

> If you try this from a GEM application you just get the symbol for char(7)
> somewhere on you screen. I suppose there shoud be a VDI output function for
> this but my MEGAMAX manual does not list such a function.

This is relatively easy so long as you don't care about porting this program to non-ST/STE/TT platforms. There is a sound daemon built in to TOS that allows you to make sounds and continue the normal flow of your program concurrently. The function is called Dosound, and is XBIOS function #32 (decimal).

Dosound takes a single parameter which is a pointer to an array of unsigned bytes. This array contains commands to the sound daemon which load various sound chip (and psudo) registers and commands which control looping and sound output. It returns a pointer to the current sound list position (usually NULL) so interrupted sound lists can be restarted (though this may cause rather odd results -- no sound register contents are preserved) or so you can detect when the sound has completed. See your compiler's documentation for more details.

I'd type in an example, but I don't have any real ST documentation here with me at work. (I've got a copy of xbios.h from the MWC dist, so I know the XBIOS function number and number of parameters, but that's all.)

Anyway, using Dosound should work just fine, and allows much more interesting sounds than just the bell (how 'bout a gun-shot, siren, bomb, or laser rifle?)
I hope this helps.

>this is undocumented, and will surely break on the STe, since the Roms are
>not in the same place!

Good for you! You're right, the ROMs are free to move from rev to rev.
So you can't use a constant for an address in the ROM. However, you
can use a variable, and there is one: the system variable _sysbase
at $4f2 holds the base of "the OS header" which is where things like
the date are kept.

This code extracts the date as a LONG from the OS header, no matter where
it lives:

```
char *sysbase = *(char **)0x4f2;
long romdate = *(long *)(sysbase + 0x18);
```

romdate will have a number like 0x04061989 for April 6, 1989.

>PPPS: and do not tell me to pay to become a registred developper, all my atari
>programming is public domain! :-)

That doesn't matter. If you paid to become a registered developer, you
would be able to look this stuff up instead of bothering all of us! :-)
You don't have to be a commercial developer to join the Atari developer
program. (I know I'm answering your question anyway -- think of it as
advertising. (If you're a Net God, *don't* think of it as advertising!))

Bugs.nosc.mil (don't know the internet numbers) archives all messages posted to comp.os.minix, both those relating to PC's and to ST's. The serial port driver from Howard C. Johnson is definately there. Look for files ending in lzaz.att.com. There were something like 12 parts to the RS232 posting. Another good place to find archives is the Mars Hotel BBS (301-277-9408) It's accessable through PC-Pursuit and it archives most of the source and interesting articles posted to this newsgroup.

>(stuff about accidentally transfering a 16-bit compressed file to his ST)

4383. Re: USENET -> GEnie uplink now working

Newsgroup: comp.sys.atari.st
Date: 1989-12-19 22:24:53 UTC
From: canada@crash.cts.com
Message-ID: <935@crash.cts.com>
Source record: 245457

In article <15097@well.UUCP> dsmall@well.UUCP (David Small) writes (now much edited):

-> It's time to announce that there is now a working uplink
->from USENET to GEnie. Each note posted into comp.sys.atari.st is sorted
->by topic, and uploaded to "Category 10" of the Gadgets RT on GEnie.
->
-> The link is one way. GEnie makes its living selling information
->bases to the public, and doesn't want them downloaded and distributed freely.
->
-> I wanted to let you know to prevent invading anyone's privacy.
->
-> Finally, yes, Gadgets does make a percentage of connect time people
->spend in it on GEnie. However, before anyone starts talking about how we're
->.... I personally am making nothing on this.
->
-> If anyone feels this is wrong, I'll be more than happy to listen and
->if convinced, drop the link.

Hmmm, I don't think this is very fair to the Usenet community, and I, for one, object to Usenet being used in such a commercial way. I have no objection to two-way *mail* links, but I seriously object to all my postings appearing on GEnie or other commercial networks. I think, perhaps, the Usenet ``etiquette'' gods may have something to say about all this as well.

What I object to the most is the fact that the link is one way (and will stay that way due to GEnie's commercial nature). I don't like Usenet being ``raped'' to supply GEnie's commercial pockets. If GEnie is that ``tapped out'' for knowledge that they are desperate enough to plunder Usenet, then perhaps GEnie should be disbanded.

```
> The original posting told us about the 'abnormal' behaviour regarding the
> use of common blocks in Absoft's implementation of Fortran.

By far the simplest way to cure the 'abnormal', ie. non-IBM, Cray, VAX etc.
behaviour of Absoft's Fortran is to set the 'H' option.
This not only enables weird F66 features like 'extended range DO loops' but
also let the compiler treat all variable storage as STATIC.

In other words: you no longer have to define all your commons in main.
In addition it saves local variables and thus constructs like:

data init/0/
if (init .eq. 0) then
...initialise....
init = 1
else
...do something...
endif

will behave as expected, ie. only initialise once.
(I didn't say I like this way of initialising...).
```

Ah, my first net posting... I'm tingling all over. Anyhow:

Dave Small just recently posted to the net a glowing review of the SyQuest 44 Mbyte removable-cartridge drives. Some other people have also shown interest in these, but one topic has failed to come up.

According to a recent STReport (forget which issue, 116 I think), SyQuest is coming out with a 175 Mbyte version of the current 44 Meg model, at about the same price, accompanied by a drop in the price of the 44's...

Since I'm a not-yet-but-realsoon Hard Drive owner, and was very close to buying a SyQuest 44, I'd like more information on this. Most importantly, will the folks who brought us the SQ555 (44 meg) in a plug-and-play format (ie: Toad, ABCO, Atari, etc..) be bringing us the 175 Mbyte model anytime soon, and for how much?

Not bad for a first post... Flameproofed and all.

I agree. The only way I'd support this would be if someone would write a quick newsgathering/reading program for the ST, and put it up in GEnie's program section. UUPC will mostly work as a base for this. I bet most GEnie subscribers won't be aware that they could be getting the USENET messages for free. Portal, at least, is inexpensive enough that it doesn't make much difference, but trying to keep up with comp.sys.atari.st over GEnie (especially in an area that only has a 1200-baud WhateverNetGEnieUses link) could get quite expensive.

Greeting-
Contact Microware in Demoines Iowa. They have a compiler that will do
the trick. Runs under OS-9 which is a multi tasking multi user reatime
romabel operating system that will run on any 68k machine. I am surprised
more people with ST machines don't run it. I would be realy frustrated by
not having OS-9.

Also check out the os9 forum on CIS as well as comp.os.os9.

MICROWARE (os9 Des Moines Ia.) (515) 224-1929

I have no conection with Microware I just use thier products on a 6809
based system with multiple windows and frequently two users at once.

4393. GDOS vs LaserJet vs me

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 03:07:04 UTC
From: hugh@dgp.toronto.edu
Message-ID: <1989Dec19.220704.27677@jarvis.csri.toronto.edu>
Source record: 245467

I recently bought an HP LaserJet IIP for my 1040ST (and my Sun, but that is another story). To exploit the capabilities of the LJ, I bought a GDOS driver for it (TurboJet from Neocept). I am attempting to use it with Microsoft Write and EasyDraw.

The whole experience has not been very pleasant. I have encountered innumerable problems, many of which remain a mystery. This note contains both cautionary tales, and pleas for help. Perhaps I should mention that my 1040 has TOS1.4, GDOS 1.1, and EasyDraw 2.3. There is only one (released) version of MS Write.

- Using GDOS to drive the LJ seems unnecessarily slow. At least the first page of fairly plain text output takes a couple of minutes. In contrast, TeX drives the printer at close to its full rated speed, 4 pages per minute. [The TeX output bytes were generated by my Sun, but they were transmitted to the printer by my ST.] The key seems to be that the TeX driver downloads fonts a character at a time, ON DEMAND. Often, most characters in a font never get downloaded. The GDOS driver may not even use fonts, I don't know.

- Being an official Atari ST Developer, I thought that I might be able to write my own driver to solve the speed problem. ATARI sent me their GDOS printer driver construction kit. Unfortunately, it contains no documentation of the interface between GDOS and printer drivers! Neither does it contain documentation on the library of routines provided to do many of the driver tasks. There are several sample drivers for dot-matrix printers, so no doubt one could easily be mutated into a driver for another dot-matrix printer. This is no help in supporting the LJ well (i.e. figuring out how to download and then use fonts). Atari Canada said that what I got is all there is. Atari US says that it is a Big Deal to get more (proposal in writing for Big People to consider).

- When GDOS is loaded, MS Write will crash when I use upparrow or downarrow keys to cross a change-of-indent. This does not happen without GDOS.

- I tried to use GDOS with a large RAM disk. Apparently this left too little memory for GDOS. The symptoms were not at all clear and it took me a week to figure out the problem. The symptoms were that MS Write and EasyDraw were not able to display all the fonts they should have, and could print even fewer. GDOS or the printer driver made font substitutions with *no* diagnostic. As you might imagine, I spent many fruitless hours playing with the assign.sys etc.

- MS Write seems to require all printer fonts to be loaded into RAM, even if they are not used. On a 1040ST, this means that you must hide some fonts from Write (don't list them in assign.sys, or don't have them in the specified files). Again, failure is indicated by printing with the wrong font.

- EasyDraw crashes when I try to save files. I found that this does not happen if I use an obsolete version of meta.sys. Migraph doesn't know why (but I only phoned them once).

- I sometimes use AMCGDOS (broadcast over the net from Germany) in place of GDOS. I have not really noticed any difference, but I use either version of GDOS as little as I can manage.

- The only PD font that I have found that comes in the resolutions I need is "Camelot". Unfortunately the 300DPI version seems to malformed: TurboJet won't touch it. Are there other PD fonts in screen and laser resolutions? I wonder if it would be easy to convert MetaFont (TeX) fonts to GDOS formats.

- Sometimes the 1040ST seems to think that the HPLJIIP is busy when it isn't. This is independent of GDOS -- it happens for normal printouts too. It only happens when the ST first tries to use the printer after the printer or the ST has been powered on (not every time; it may depend on which is powered on first). I presume that this is related to problems people have reported with HP DeskJet printers connected to STs. The program djreset.acc previously broadcast on the net seems to overcome this problem, but it is hard to activate it while running a non-GEM program.

Trying to discover the source of problems or find workarounds is very painful. There are just too many components and I have no tools to audit the interfaces.

GDOS is a tool that adds what should be an important dimension to the ST. Many feel GDOS should have been built into GEM, burned into the ROMS. The current licensing rules just seem to be a nuisance. Since AMCGDOS has been broadcast, all that is needed to avoid licensing is a collection of reasonable fonts and printer drivers.

GDOS as it is now is cumbersome and slow. For me, the worst problem is that I now have very little confidence in GDOS-based software.

Remember: my experience has been as a user, not a programmer. I have not used it extensively (too painful :-). So take my comments with a grain of salt.

Well, back in 1984 Atari had a company called Atarisoft which sold software for commodore 64 and other computers...Perhaps things have got so bad for Atari (i.e., ST in the market defeated by the Amiga) that Atari wants to try the old trick again. However, last time the trick did not work... (Atarisoft was a failure.)

4395. AES Command - APPL_FIND?

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 04:00:57 UTC
From: nut@wet.UUCP
Message-ID: <873@wet.UUCP>
Source record: 245469

Does anyone out there in netland know of the proper parameters to pass for the AES function APPL_FIND? I am a starving student/shareware programmer, and not having the funds to pay for a full developership, have had to rely on ST Internals (an Abacus book). Just the parameters are needed, as I have Tom Hudson's excellent tutorial from STart...

Many thanks!

Hello all,

[I'm sorry that I reply only now to this message, but the recent amount of
Info-Atari16 Digests gave me a hard time catching up.]

In Info-Atari16 #705, John M Williams (jmw%tasis.utas.oz@uunet.uu.net) said
in reference to my earlier posting:

>A recent article suggested three possible methods by which a process could
>determine whether it was being run from the desktop or from a shell. I'd like
>to suggest another method which works for me. I don't suggest that it is
>foolproof however. It simply requires moving the basepage ptr up to its parent
>until it becomes null. If this requires three iterations then the program
>is running from the desktop. Any more and it is running from a shell.
[Code example omitted]

In Digest #734, nis!pwcs!stag!daemon@UMN-CS.CS.UMN.EDU (Dale Schumacher)
replies:

>Alright, I guess it's time to post this message again (is this the 3rd
>time now?). The quoted message is mostly correct, but incomplete. The
>situation is slightly different if you're in the /AUTO/ folder programs
>at boot-time. I check for the text-base pointer pointing to ROM, as
>recommended by Allan Pratt @ Atari. The following code (which, like John's
>code, assumes access to a basepage pointer) uses this "approved" method.
>I've also included a copy of <basepage.h> from dLibs for those who don't
>know the layout of the basepage structure.
[Code example omitted]

Finally, in Digest #740, portal!atari!apratt@uunet.uu.net (Allan Pratt) joins
the discussion:

>dal@syntel.mn.org (Dale Schumacher) writes:
>>I check for the text-base pointer pointing to ROM, as
>>recommended by Allan Pratt @ Atari.
>
>Yeah, well, that was before there were RAM TOSes running around. Caveat
>hacker. No RAM TOS is supported by Atari (at this time) and most are
>illegal copies, making their users pirates, so it's not that great a
>hardship.

Thank you all for replying. One of the things I wanted to find out by posting
my original code samples was whether one can rely on the 'somewhat-documented'
facts one has to exploit to find out where the process came from.

Is the three-times-iteration method approved? Will it hold true in later
TOS revisions? Same goes for my method, checking the os_magic pointer. I took

pains to ensure that the code samples I sent out also work with TOS 1.6 (STE) and TOS 3.0 (TT). Dales version has the advantage of also detecting that the program was started from the auto folder. My version also works with RAM and STE/TT TOSes.

Maybe Allan can tell us if one or the other method will be supported by Atari, or if there will be some kind of system variable that tells the current process if his parent is a shell or the desktop. Such a variable would also make life easier for programs like Neodesk etc.

A side note to Allan: Take the ROM TOS 1.4, disassemble it, make it fully relocatable, write a little RAM loader, and you have a RAM TOS. Does that make me a pirate??? [BTW: Such a RAM TOS is great for testing out little OS tweaks and patches ... :-)]

>is the lack of Line F compression in STE and TT ROMs. The Line F
>compression adds a bit of overhead to AES operations, and desktop/window/
>dialog operations are noticeably sped up when the compression is gone.

Yes, Ken is right. QuickIndex reports a GEM speed increase of 9% when those
blasted Line Fs are removed from the current TOS 1.4 version.

In Info-Atari16 Digest #714, mcsun!hp4nl!ruuinf!verwer@uunet.uu.net
(Nico Verwer) asks:

> In article <1820@atari.UUCP>, kbad@atari.UUCP (Ken Badertscher) writes:
>> walkerb@tramp.Colorado.EDU (Brian Walker) writes:
>> | What did you do with the line F compression?
>> It's gone. Because of the larger ROM space in the STE, (and TT), the line F

>> exception overhead gone, the AES moves along noticeably faster, too.
>
>Why didn't Atari use large ROMs for the 1040 in the first place? Using
>line-F makes upgrading to a 68020 and a floating-point coprocessor really
>difficult. Now it also appears that exception overhead seriously affects
>AES-speed 8-(!
>Were ROMs so expensive at the time that Atari felt they should decrease
>ROM-size at any cost, or is this a problem of the MMU, or what?
>Will there ever be a chance for 1040 owners to use a larger ROM-set,
>thus being able to painlessly use a 68020 running standard TOS? Is it
>possible to make a hack and solder the extra ROMs in? Or would you have
>to replace the whole motherboard with an STE-board (which has the same
>case anyway)?

Note that the ROM image actually becomes SMALLER if you take out the Line F
codes. Yes, that's right, the Line F handler and the jump table use up MORE
memory than they save. So it's not a question of too small ROMs, but of
inadequate programming. With a little work, you can make TOS 1.4 cooperate
quite nicely with an 68020/030. The biggest obstacle is the way the timing

routines (for things like floppy delay etc) are implemented. You have to recalculate all loop counters and the like manually. The cleanest way would be to use a timer, and if you look closely at the TT TOS 3.0, you'll see that the TT HAS AN EXTRA 68901 that is used for exactly that purpose!!!!

Finally, in Digest #742, att!chinet!saj@ucbvax.Berkeley.EDU (Stephen Jacobs) wonders:

>In article <1841@atari.UUCP> kbad@atari.UUCP (Ken Badertscher) writes:
>>rehrauer@apollo.HP.COM (Steve Rehrauer) writes:
>>| I know what you mean by "Line F", but what's the "compression" refer to re:

>>
>>The line F compression I refer to is a method we used in ST ROM which
>>basically replaces common operations with line F instructions. The
>>line F handler is able, by decoding the $Fxxx instruction, to determine
>>what operation to perform. The handler then dispatches the exception
>>to the appropriate OS routine.
>
>This brings up the question of what the ROM code does instead. Have all the
>little line F routines been made into subroutines, with more-or-less ordinary
>subroutine linkages (I don't know the exact count, but there are A LOT of
>line F routines)? Are the routines invoked by subroutine calls to a
>dispatcher (a la GEMDOS)? Has the code been brought inline?

There's a lot of Line F instructions in a relatively small part of the ROM, the AES. They fall in two groups: 'fast' subroutine calls, and a "save-some-registers-unlink-stack-and-return" group. The only difference is the registers that are to be restored. The handler looks at the Line F code, checks which group it belongs to (the LSB determines that), branches accordingly. If it's a subroutine, the jump address is taken from a table. If it's a restore-register instruction, the register mask is decoded, and the requested action is performed. You can bet that this takes more time!! I don't want to post code samples since Atari probably won't like it.

Unfortunately, the TOS14FIX.PRG that repairs those two TOS 1.4 bugs installs a new Line F trap. The solution is to fix the bugs within TOS while you're at it anyway. :-)

Enough operatingsystemology for today. (Or is it TOSology? :-)

4400. Re: ICD driver software

Hello all,

In Info-Atari16 Digest, Ray Wallace (wallace@oldtmr.enet.dec.com) replied to my query:

>In article <8911300807.AA08786@ucbvax.Berkeley.EDU>, VBRANDT@DBNUAMA1.BITNET
>writes...
>> BUT: The included ICDFMT.DAT file says Version 3.00 and lists only "d" type
>>entries, ie. only disk drives, no more controllers, such as for my Maxtor.
>
>The following is from ICD's READ.ME file -
[Excerpt omitted]

Thanks, Ray, for pointing this out. The ARCUTIL program for VM/CMS wouldn't even show the READ.ME file in the archive, let alone extract it, and I jumped to conclusions.

>Sounds like you can't use ICDs V4 software with anything but OMTI, ADAPTEC,
>and embedded SCSI drives.

What else is there? Has anyone ever used SASI? Also, can anyone recommend a good, cheap embedded-SCSI tape streamer that can be hooked up to an ICD adapter?

4401. No more shar files please

>the shell archive manually with MicroEMACS. Arggh! UUDecoding a .ZOO file
>is *so* much simpler.

Yes, yes, please stop those shar files. I have to manually repair each and every one I receive, if only because of long lines having been wrapped. I'm grateful to Steve Grimm for the work he puts into the archives, but I'd rather get sources in ZOO (or ARC or ZIP or ...) format.

(John Kawakami) said:

>The only PD PS I can think of off hand is Ghostscript from the GNU project.
>Ghostscript is a PS screen previewer.

Has anyone taken a shot at porting this to the ST? It shouldn't be too hard,
now that there is a GCC for TOS. I know there is an executable version for the
PC (in fact, I have it, but haven't even unpacked it yet).

I'd do it myself, but I lack the time and I'm not a C wizard either. I would
prefer to have Ghostscipt on the ST, and I wouldn't mind that much if it's big
and/or slow.

Don't know about possible Gulam limits, but there IS a TOS-limit of
about 125 characters. There is an official work-around, but I wouldn't
expect any program to support it (yet).

>And how can I solve it?

Build a library! (Even with unix, the cc has a limit of several hundred
o-files, and for greater programs you have to build libraries first)

I know that You believe You understand what You think I said, but
I'm not sure You realize that what You heard is not what I meant.

4410. Optimism about Atari Canada

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 13:47:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8912210814.AA06102@ucbvax.Berkeley.EDU>
Source record: 245484

One netter posted a note about what he perceives to be an upward turn in Atari fortunes (e.g. 6 1040STEs sold by a dealer in Toronto). The following is a copy of a note I sent to Geoff Earle, the national sales manager for Atari Canada. Now, I really should not be posting this note for two reasons. First, Mr. Earle has not had time to respond to it and second, I am sending this note from my regular full time day job mainframe mailer and I should not be doing any third party business on company time (I'll skip coffee break this morning). However, if anything, this posting will have a negative effect upon my Atari dealership because it points out the problems I have had as a novice dealer. In addition, it is a general interest item that is not business oriented so I hope my local management will forgive the minor transgression (I am doing this for the greater good of Atari users, not for personal gain).

I do want to point out that Atari Canada has tried its utmost to get me through the problems in one piece (special thanks to Denise Carrol). However I am a little disappointed to hear on the net that a Toronto dealer has actually sold 1040STEs when I was told by Atari every day for the last two weeks that there are no STEs available in Ontario (only a 'small shipment to be sent west', whatever that means). As I say in the letter below, I want to be honest with my customers, I expect the same of Atari Canada and its relationship with its dealers.

==========

89.12.18

Attn: Mr. Geoffry Earle

To say the very least, my experiences with Atari Canada since becoming a dealer have not been memorable.

1. The first problem started when Bruce Stetham made what seemed to be a minor error and told me that 1040STE computers were available in Toronto (in October). I advised my customers to order STEs instead of the old 1040STs thinking that it would be only a matter of days before Atari Canada could ship the equipment.

Since October, I have been told a least 6 different dates for STE availability. Two customers who had ordered STEs have since acquired alternative (i.e. non Atari) systems. I have been unable to sell 1040STs because everyone is waiting for the STEs. As such, my bread-and-butter product, which was supposed to be available, has put a large roadblock in sales.

I ordered two STs for store stock in lieu of STE product.

2. I have an order on the books for two STACYs with 20 meg hard drives. I know that STACY availability was never specified and I can accept the delays. Unlike the STE issue, I was not given a lengthy list of delivery dates only to see each one missed. Hopefully, Atari will have STACYs soon.

3. I ordered a PC4/12H and a PCC1424 EGA monitor. The PCC1424 was not available and a PCM124 was substituted. When the PC and monitor arrived, they were DOA. In addition, the shipping cartons already had return authorization numbers and it is likely that the system had previously been returned DOA to Atari prior to shipment to me.

The PC had been ordered for a public display at one of the local schools. I had to bite my lip and tell people that the PC arrived DOA and apologized for advertising a system I could not demonstrate.

The system was return on a CRA number and a credit issued. However, the credit was for a mono system yet I had paid for a colour system. Now, I am trying to get Atari's finance department to correct the discrepancy between the surplus I calculate to have on account with Atari and what Atari says I have on account. Hopefully, this can be resolved soon.

In addition to the physical problems with the PC4, I advised Bruce Corbett that the dealer book specs for this computer were different from the machine that was delivered (different BIOS, 1 serial port not 2). I asked that I get clarification as to the current specs for the computer. So far, I have not received any information.

4. I ordered a Mega 2/SM124 system. The Mega 2 arrived DOA and was returned. So, out of orders for four computers, two arrived DOA. Let's hope the DOA frequency drops for future orders (I am still waiting for the Mega 2 to return from Atari).

5. Today, I called Atari about the availability of the Atari ABC286/30 computer (AT compatible) and I was told by both Denise Carrol and a representative in your service department that they had never even heard of this system. This response from Atari was both unexpected and irritating. Having come close to finalising the sale of an ABC286/30 with only the delivery date to be determined, I was amazed that Atari staff claimed to have never heard of a system that has a detailed spec sheet in the dealer book.

Quite simply, this situation is unacceptable. How can I possibly sell Atari equipment when I can put absolutely no faith in the dealer book or the ability of Atari Canada to supply products? The only problem I have selling Atari computers is Atari Canada.

I would like to find out from you, the National Sales manager, if I can expect to receive a dealer book that has accurate information and

if I can be given realistic and reliable delivery dates for products. Otherwise, I have to tell prospective customers that it is not a safe bet to place an order for Atari computers. I am honest with my customers, hopefully Atari Canada can be honest with its customers the dealers.

If it is legal, could someone PLEASE post the Blitz software in the
binaries group or somewhere? I don't have access to GEnie nor do
I know anyone who does. I also can't ftp from here.
I've built the cables and am now just awaiting code.

Many many many thanx in advance!

Message-ID: <8912210815.AA06204@ucbvax.Berkeley.EDU>
Source record: 245487

Since some mega2s aren't expandable what can be done about it? What
workarounds (read: kludges) can be used to get the extra 2 megs? I still VERY
MUCH DISLIKE seeing Atari go to the trouble to give a very good computer a
very stupid limitation but It would probably be better to do something about
it rather than flaming people who didn't have anything to do with the decision.
(something about biting the hand that feeds you...)

Some honest (and hopefully fireproof) questions & comments:

I. How many colors can the STe display at the same time? 4K colors would b
e
useful for fine shading _if_ you could display enough of them. With only 16
the extra shades are nearly useless. Is there a mode similar to Amiga HAM?

II. Does the STACY have the STe's sound chip?

III. Thank you Atari for using SIMMs on the new STs! (I can be a
cheerleader too! 8~D rah! rah!)

-- Happy Holidays!

Frustration: Getting your first 'Out of memory, request denied' message and
finding out your computer isn't expandable on the same day.

First, thanks to everybody who pointed me to the good location:
((int *) _sysbase) + 1

But I want to issue a warning to US ST programmers:

In article <1903@atari.UUCP>, apratt@atari.UUCP (Allan Pratt) writes:
> romdate will have a number like 0x04061989 for April 6, 1989.

Do not rely on DATES! The french TOS version has the date of the translation
into french, not the US date, so relying on dates on your code will break
in other countries... (Twister did in fact, it checked the date of the
new US roms, which failed on french ones)

Thanks anyways for you reply, Alan.

>Diane Barlow Close

I agree with you, to an extent. However. The flow of information should be regarded as a good thing. It would me MUCH better if EVERYONE could access Usenet, but that ain't so. I'm lucky; I'm a student who happens to work in the computer labs, so I have Unix accounts everywhere. Other people who would like to know have no means of getting to this information. I'd post the info to the local BBSes if I had the time (a working computer would help, too). But I don't. Not for all of it, at least.

Mike

4416. FLAMES and SUPPORT IN THE MINUS REALM

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 16:56:23 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8912210817.AA06313@ucbvax.Berkeley.EDU>

fox!portal!cup.portal.com!Bob_BobR_Retelle@apple.com mentioned that the ST comes with ST Basic, Logo and documentation. I don't think this is true at the present. When I bought my ST in April, it didn't come with Logo or any manual for ST Basic. It did come with a short list of ST Basic system calls which is useless without the manual since the arguments are not explained. I'm not complaining. I wouldn't have used them anyway (I prefer compiled languages). So why should I pay for it. Besides, those people who really want to use ST Basic can buy it.

4417. questions about memory extensions, deskjet plus, laserjet IIp

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 17:10:00 UTC
From: FD@BGERUG51.BITNET
Message-ID: <8912210815.AA06206@ucbvax.Berkeley.EDU>
Source record: 245491

Dear Atari-networkers,

Some time ago I asked a number of questions about memory-upgrading
the Atari Mega ST1 and using the Deskjet Plus. As I did not receive
many valuable answers I will fire my questions again :

1) Is it possible to upgrade an Atari Mega ST1 to a Mega ST2 or even
a Mega ST4? Are there any commercial vendors for this hardware (please
give any references, preferably in Europe), or can I do it myself?
In that case I want a precise descriptioon on the procedure that has
to be followed (I am not a hardware specialist!).

As I only bought my Atari Mega ST1 recently , I have not yet opened the box
as this would screw up my guarantee. I'd rather wait some more time
for this. Can anyone give any details on the hardware differences between
the Atari Mega ST1 (or Mega 1), the Atari Mega ST2, the Atari Mega ST4?

2) Some time ago, I wanted to by a HP Deskjet Plus, to connect to my Atari.
For the 1st Wordplus text processor, people at our lab developed a driver.
In Timeworks the Laserjet driver can apparently be used without any
difficulties. If you want to use the Deskjet from within GEM-Draw or
EASYdraw, we don't have an appropriate driver. An alternative here is to
use the EPSON-emulation cartridge, but this has it's disadvantages :
low resolution, bad quality (ink problems with bold because of repetitive
strike-overs), and slow!! (You can however get screen dumps in that case!)

In 1st Wordplus the Deskjet functions reasonably fast, but from within
Timeworks it acts unbelievably slow. To produce one A4-paper for a
publication (several fonts and graphics), it takes appr. 1 hour! This
is unacceptable!

Can anyone give any comments this?
I very recently saw a HP Deskwriter (RS422 serial interface for connection
with Apple computers, and it worked much faster, certainly an order of
magnitude : minutes vs. hours. The machine very much resembles a Deskjet
Plus externally. I wonder if this could be connected to an Atari?

3) In Europe the HP Laserjet IIp appeared recently. Can somebody give remarks
on the connection Atari - Laserjet IIp? I recently noticed a number of
E-mails which were not in favour of this combination. One of the reasons
was the low speed? Is this true, and/or are there any other inconveniences?

Many thanks in advance.

Why do people assume that PCs are DOS-ONLY-FOR-EVER-AND-EVER systems?
One can run UNIX and X11 any time of the day.
(and call DOS in a window, if necessary).
Ever heard of DOS Extenders?

A 386SX motherboard (20Mhz) that costs $311 comes with sockets for 8Mb.
(and 6 expantion slots :-)

I believe that you are right Greg.
Probably it will not cost them more... Eventually!

Since Mega2s can not be expanded, more people would be *forced* to pay
the unreasonably more expensive Mega4s. (now, 1Mbyte costs $90)
So, more money for Atari, less for its loyal followers.

Thus, they can afford the extra cost of manufacturing and keeping
double inventory.

Source record: 245497

Dear World,

I want a spreadsheet for my Mega 4. It has to be fast, and it should ideally support either an HPLJ+ or HPGL for graphics output. Can anyone make any recommendations? Email me, and I'll summarize back.

Jan Ameij
ameij%uk.ac.oxford.vax@however.you-get.to.janet

PS It came with VIP Professional. It's lousy. I hate it. Please don't recommend it. I mean, a piece of software with a list price of 130 quid that can't work with a hard disk?

PPS Info for Laser printer debate. I've got a Qume CrystalPrint Series II. It's very nice indeed - HPLJ+ plus for 100 quid a good HPGL cartridge. Seems pretty cheap to run, nice and small, great for TeX (real computer users use TeX). I'd recommend it. It was about 1100 quid, including HPGL card, but is probably less by now!

4424. The Rape of Usenet

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 17:47:14 UTC
From: canada@crash.cts.com
Message-ID: <946@crash.cts.com>
Source record: 245498
Cross-posted to: news.admin,news.misc,comp.sys.atari.st,alt.flame

This message was posted by Dave Small to the atari newsgroup, and I have
many objections and some questions I'd like to pose to the net (so as not
to waste net $$ please direct all followups to news.misc or alt.flame):

-> Date: 19 Dec 89 06:00:28 GMT
-> >From: dsmall@well.UUCP (David Small)
-> Newsgroups: comp.sys.atari.st
-> Subject: USENET -> GEnie uplink now working
-> Message-ID: <15097@well.UUCP>
->
-> It's time to announce that there is now a working uplink
-> from USENET to GEnie. Each note posted into comp.sys.atari.st is sorted
-> by topic, and uploaded to "Category 10" of the Gadgets RT on GEnie.[...]
->
-> The link is one way. GEnie makes its living selling information
-> bases to the public, and doesn't want them downloaded and distributed freely.
-> [...] I just want to get the maximum freedom of information
-> exchange possible between these networks; [...]

I object to this ONE WAY transfer of information. Dave talks about the
exchange of information. This is not an *exchange*, it is a one-way
transfer of Usenet information. I object to the rape and plunder
(*for profit*) of Usenet! A summary of Usenet, or perhaps ``this is the
latest from Usenet'' (1 or 2 articles follow), is acceptable. This wholesale
plunder of Usenet is not.

-> I wanted to let you know to prevent invading anyone's privacy.
-> [...] If someone has a real need not to have their notes forwarded to
-> GEnie, I will be happy to put a "filter" on to prevent it by request; [...]

I think this should be changed to ``only take articles from Usenet if a
person sends Dave his *approval*''. Why should I have to trust Dave to remove
my articles? What if he misses one? What if my mail can't get through?...

I also object most strenously to Dave limiting MY access to information by
scaring away Usenet posters who don't want the kind of publicity GEnie
offers. Usenet is supported FREELY by a conglomeration of machines (each
company covering a bit of the expenses) and I object very, very much to
GEnie profiting from other sites' generousity.

-> It seems to me like a benefit for everyone involved, especially
-> if/when 2-waymail gets going.

A benefit for *everyone*? It is only a benefit for *everyone on GEnie*.
Usenet people don't benefit *at all* from this one-way ``exchange'' of

information.

-> [...] other areas on GEnie are
-> expressing great interest in having a USENET uplink. Basically, folks,
-> USENET is perceived as the place where the people who know what they're
-> doing post notes.

Does this mean that soon *all* Usenet groups are going to be appearing on GEnie? I hope we can stop this before it gets out of hand!

-> Why do it? Because a long time ago, on the CERL site on PLATO, a
-> person named Sherwin Gooch, ex-PLATO, ex-Atari, and now with Apple,
-> introduced me to the hacker ethic and freedom of information exchange as
-> its primary goal. (No, not illegal exchange, you know what I mean). [...]

I don't call a one-way exchange ``freedom of information''. I also don't call *free information* being uploaded to a *pay service* ``freedom''. The hacker ethic is AGAINST the *sale* of information (as GEnie represents). If you want a TRUE example of the hacker ethic, then read a bit about Richard Stallman and the Free Software Foundation. *They* represent the hacker ethic!

-> If anyone feels this is wrong, I'll be more than happy to listen and
-> if convinced, drop the link. [...]

Write Dave Small and voice your objections TODAY, before it's too late and Usenet becomes GEnie (and you have to pay through the nose for what was formerly free)!

-> Well, enough said. I hope this leads to good things -- GEnie users
-> getting good information on time, for instance.

It's obvious from this sentence who is benefiting from this ``exchange'' of information -- GEnie and no one else.

The more Usenet becomes publicized, the greater the danger of someone in political power becoming ``concerned''. Perhaps concerned enough to pass legislation like that currenly up for review in New York: a sysop must validate each and every *message* that is posted to his BBS and must also guarantee privacy of the message and guarantee that the message NOT appear on any other service.

Is there anything (legal?) that we can do to stop this link? In general, are there any ``net rules'' for this type of thing? Is GEnie in any danger by uploading Usenet articles wholesale?

I agree whole heartedly! This arrangement puts money into GEnie and
does the net absolutely no good. Dave, you've done a lot of good things
for the Atari community but please put a stop to this before it goes any
further.

I wonder if Chris's copyright notice is a good way to stop this sort of
thing. Better still, how about something more specific....

>hardship.
#
A side note to Allan: Take the ROM TOS 1.4, disassemble it, make it fully
relocatable, write a little RAM loader, and you have a RAM TOS. Does that make
me a pirate???

I use my RAM TOS obtained when I bought my ST to run programs that won't
run under TOS 1.4. Anyone who bought their ST before the ROMS were available
(pre 1040 days) got a TOS on disk.

4428. dvi to 24 pin

> undo of all stacked calls?

Wind_update() must be called in ON and OFF sequence. It doesn't
matter how many times you call it as long as they are called in that
sequence. Sorry, there isn't any way to find out how many times you have
made that call.

Wind_update() should be called when you are going to do a lot
of screen update and you don't want to be interrupted in the middle of
the operation. The best place to call wind_update( 1 ) is right after
the event_multi(). Make sure to call wind_update( 0 ) before you entering
back to the event loop.

> out'' for knowledge that they are desperate enough to plunder Usenet, then
> perhaps GEnie should be disbanded.

I disagree. There are sources of information and there are distributors
of information. We, the users of Usenet are the source. We have decided
to share that information with others. And GEnie is not providing access
to that information - for a price. Usenet offers the same but the price
is different. In my case, a company that I own part of foots the bill for
providing Usenet services to employees as well as feeds to other
companies. Other companies provide Usenet access for money.

Now, anyone who is on GEnie and reads this can decide they would rather
pay a different provider of service. For example, in Seattle there are at
least three companies that will provide Usenet access for a price.

The Future of INFO-ATARI16:

There is a movement afoot (althogh not heavily supported) to set up alternatives to INFO-ATARI16 so that selected users can receive more coherent information, presumably without all of the flames mixed in.

I oppose the creation of such a service because it would become too narrowly speciallized. The Atari marketplace is already a lonely place for interested users and I do not see any value in allowing the user community to become even more fragmented.

I believe that what we really need is a couple of good writers and editors to take material that is of widespread interest an repackage it into archival publications that wouuld have a permanenet home on one of the archive sites.

If such archival material were to migrate into the hardcopy Atari press that would be all to the good. I note that many of the questions that are asked here (at considerable expense, I might note) have been answered in the magazines.

I personally find the flow of unrelated information that passes across my screen from INFO-ATARI16 to be quite interesting because it raises issues that those of us in the colonial provinces of the Atari world (yes, the USA appears to be a colony of Europe when it comes to matters Atari) tend to miss or to solve in isolation. I would not like to see the newsgroup become the exclusive province of the flamers nor would I like to have to hunt all over to get the really good stuff.

I vote for keeping things the away they are but I would plead for people to post information that has more content and to point us toward archival sources of solid technical data. I would be happyu to post some tables of contents for the magazine that I am associated with if anyone is interested. In recent months I personally have done lengthy writeups on the Syquest 44 and hard drive backup technology. I do not wish to upload these here unless someone has an interest or unless some has a home for them on a good archive site ("good" meaning ftp-able, as that is all I understand how to do).

It appears that there is a tendency to post the burning question of the moment to the net when a little research in a library would yield a quicker and sounder ouutcome. Magazines like Current Notes and ST Informer, and to some extent z-Mag and ST REports, have solid technical information that is more useful than some of the spur of the moment responses that get passed around here. On the other hand I

have found some of the questions raised here a rich source for things to write about in my magaize efforts to help all Atari users.

>further.
>
>"Don't drive too slowly." Richard Caldwell

There is a solution to this, but GEnie must be willing to reciprocate
fairly for their gain if they intend to plunder Usenet for their own advan-
tage.

I am not against allowing more general access to comp.sys.atari.st if it
will help support the US Atari ST owning community. But since GEnie is a
for-profit service --

```
-------------------------------------------------------------------------
| To be fair, they should return the benefit by posting summaries of their |
|postings, and cullings from their PD uploads, to Usenet in return. |
-------------------------------------------------------------------------
```

It is time for two new Newsgroups: comp.genie.atari.st.talk and
comp.genie.atari.st.bin . These should
both be newsgroups moderated by GEnie staffers.

Sounds FAIR to me!

>postings appearing on GEnie or other commercial networks. I think,
>perhaps, the Usenet ``etiquette'' gods may have something to say about all
>this as well.

An argument could be mounted that Usenet has no gods, only a handful of
people who occasionally lapse into delusions of godhood. :-) The best
description of Usenet that I have heard is "barely controlled chaos."

What is wrong with GEnie making the data available?

Is it that GEnie makes a profit? By far the majority of Usenet sites are
for-profit companies. Or at least they *try* to make a profit.

Is it that GEnie charges for access to the data? That standard would
equally condemn WELL, Portal and even Crash Timesharing (pnet01 charges
for access, according to the nixpub listing). And the universities
certainly tend to charge a pretty stiff tuition these days. So scratch
them, too.

Is it that GEnie somehow prevents free access to the data? Consider that
most corporate Usenet sites don't allow *any* public access. GE makes it
available to more people, not less.

>What I object to the most is the fact that the link is one way (and will
>stay that way due to GEnie's commercial nature). I don't like Usenet being

>out'' for knowledge that they are desperate enough to plunder Usenet, then
>perhaps GEnie should be disbanded.

Plunder is a pretty strong word. Usenet, as in "the community of users who
have agreed to freely share data," is not diminished. On the contrary, it
is GEnie that is at risk. As more people become aware of Usenet, they may
choose to patronize one of the many public-access Unix systems rather than
the controlled, centralized, regimented -- and commercial -- services.

4437. TT memory - how do you get 26 megabytes?

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 21:09:14 UTC
From: jlf@a.cs.wvu.wvnet.edu
Message-ID: <608@h.cs.wvu.wvnet.edu>
Source record: 245411

I was discussing the TT with one of my friends today, and the question came up about how the memory in the TT is configured to get 26 meg out of 4 mb simms. 26 seems like an odd number - especially with a 32-bit data bus on the '030. With 4 mb simms on a thirty-two bit bus, you get banks of 16 mb. Is part of the memory configured at 16 bits?

I would also like to add my thanks to KenB and the others at Atari for being here on the net. That's one reason I'm sticking with Atari and am eagerly awaiting the US release of the TT. Keep up the great work guys!

Happy Holidays to all on the net!

>got so bad for Atari (i.e., ST in the market defeated by the Amiga)
>that Atari wants to try the old trick again. However, last time the
>trick did not work... (Atarisoft was a failure.)

Hmmm. I worked for Atari at that time QAing the Atarisoft line. We
were told internally that Atarisoft was was one the main things keeping
Atari afloat.

This was when Warner still owned Atari, but had performed it's major
layoffs (I was laid off from the computer division and picked up by the
Atarisoft group). The company was struggling to barely survive during that
period.

Actually, the Atarisoft products were one of the things that Atari
really did right. We found some of the best Arcade game players in the country,
and hired them to tell us all the tricks, tips, etc of the arcade games we
were converting. Whereas old conversions of Pacman did not "feel" like the
arcade version, Ms. Pacman behaved in exactly the same way as the arcade (at
least as far as our experts could determine).

Given the environment at the time, I was reluctant to take internal
info at face value, so Atarisoft may really have been a commercial failure.
However, as Atari was bought out shortly after I left the company, the
cancelling of Atarisoft may have had less to do with the commercial
success/failure of the products than with Tramiel's corporate vision.

Do you have real info about the success/failure of Atarisoft or are
you just looking at the fact that it's not around anymore?

4439. "The Atari formula" (was Re: Sig Hartmann Goes to Televideo)

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 21:59:35 UTC
From: merlyn@iwarp.intel.com
Message-ID: <5372@omepd.UUCP>
Source record: 245413

In article <33294@ucbvax.BERKELEY.EDU>, kawakami@ocf (John Kawakami) writes:
| Televideo, which five years ago was making $170 million on terminal
| sales, now faces a sea of red ink. Hartmann plans to use the Atari
| formula to bring back the company's fortunes. "My pnals are to run a
| lean, lean, lean organization."

The Atari formula? Hmm, what could that be?

1. Start by making a little video game inside each of the terminals.
Make it play table tennis...

[steps 2 through 5 deleted because I have to get back to work :-]

6. Preannounce lotsa nifty new advanced terminal designs to get the
public taking Televideo as a "serious contender" in the marketplace.

7. Put an end to any preannouncements because of failure to deliver
products within the expected timeframe.

8. Spin off the most profitable section of the company (the
arcade-style graphics board).

9. Purchase a series of consumer retail stores that previously sold
Wyse 60's to eliminate the competition's distribution.

10. Announce a "laptop terminal" through the rumor mill, but deny
it vehemontly in comp.sys.terminal.televideo.

11. Sell off the consumer retail stores at a tremendous loss, to drop
the value of the stock so that the insiders can pick it up cheap.

12. Start selling a "cash-register compatible terminal" with ads in
Business Week and WSJ to advance the "business" image.

13. Have Sig go off to a different company.

:-) :-)

Just a happy user of my old "first off the assembly line" ST,

>Probably it will not cost them more... Eventually!
>
>Since Mega2s can not be expanded, more people would be *forced* to pay
>the unreasonably more expensive Mega4s. (now, 1Mbyte costs $90)

You are obviously wrong on 2 counts:

1) Then Atari would have not put SIMMs onto the STE
2) Then Atari would have not taken a $40 million charge against
earnings for losses because they paid too much for components
in those same Mega2's and 4's.

I think you'll find that soon Mega2's will disappear and Mega4's will
drop in price, reflecting lower component prices. Atari has inventory, and
when component prices drop they get left behind if they aren't careful.

Leave your silly conspiracy theories at home.

>Thus, they can afford the extra cost of manufacturing and keeping
>double inventory.

Oh, so YOU claim enough knowledge of manufacturing to know that
Atari is spending more money. Gosh. I never knew you were an expert.

4443. Usenet -> GEnie Link Considered Harmful

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 23:30:49 UTC
From: dmb@TIS.COM
Message-ID: <8912202330.AA02448@TIS.COM>
Source record: 245417

I've never felt compelled to write a netnote about anything political
before, but the proposal to establish a one-way link from Usenet to
GEnie really bothers me.

I agree with Diane Close that this is a bad thing, for many of the reasons
she gave. (See her early posting "The Rape of Usenet", 20 Dec 89)
The one-way nature of the link absolutely goes against the "freedom of
information exchange" which Dave Small is seeking.

It is unfortunate that GEnie's policies make it look like we Usenet folks
are "hogging information", but unless a two-way link is established Dave
Small will essentially be SELLING the FREE information provided here ---
there is no exchange whatsoever (Usenet gets nothing).

Let me point out that I believe Dave Small had noble intentions in proposing
this. I am NOT accusing Dave Small of any ill intent. On the contrary,
I believe he thought he would be providing a service for the ST community.
I just think his proposal for a one-way Usenet->GEnie link would start a
trend that could damage the Usenet permanently.

My humble opinion:

A two-way link or none at all.

David Baggett
(mail to dmb@TIS.COM)

My opinions on this matter do not in any way represent the opinions of
my employer.

4444. Comparing Apple and Atari peripheral prices

Newsgroup: comp.sys.atari.st
Date: 1989-12-20 23:39:07 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8912210835.AA07308@ucbvax.Berkeley.EDU>
Source record: 245418

In a discussion on unexpandable mega ST's, kclenden@silver.bacs.indiana.edu
Kevin Clendenien states that Apple computers (he
also mentioned another brand) need Apple peripherals and that they cost much
more than Atari ST peripherals. I don't know if you've looked at the Apple
side of things lately, but this just isn't true.

First of all, Apple computers (specifically Mac's) don't need to use Apple
peripherals. Maybe you're not aware that there are more third party peripheral
suppliers for Macs than for ST. Just look in any Mac specific magazine
and you'll be surprised to find how many brands of hard disks (internal and
external), back-up tape drives, graphics display cards and monitors and
floppy drives are available for the Mac. There are also alternatives to
Apple Laserwriter and Imagewriter.

Second point. Apple peripherals from third party suppliers are priced
at least the same as Atari ST peripherals. In some cases, they are even
cheaper on the Mac than on the ST. For example, look at hard drive prices.
Quantum has an ad for a 20 Meg hard disk for $499 (Atari Explorer). You could
buy a larger drive for the Mac for the same price (Cutting Edge: 20 Meg - $439.
30 Meg - $499). External floppy drive for the ST costs $149 (this is the
cheapest I've seen). An equivalent Mac floppy drive costs the same. Of course
memory is also cheaper on the Mac.

It seems to me that the only thing cheaper on the Atari ST is the computer
itself. I have a bare 1040STF at home and a new Mac IIci with loads of stuff
at work.

The first one should work, but the 2nd one has a few problems. Better to use Fforce(0, (int)Fopen("con:", 0)); if you have to use this method. The example Piet gave will (on many compilers) push a long onto the stack where Fforce expects an int... Fopen "really" returns a long for some librarys..

In actual practice, I'd avoid using the 2nd form altogether since it uses up a file handle that isn't going to be freeded until the program exits. Do a bunch of these calls and you'd suddenly discover your program couldn't open any more files...

I agree entirely with Diane? on this one. Genie is commercial, and wants
money from me to use it. If I wish to give them information, I will join
GEnie. A fair? solution is the downlink of their respective items, which
I'm sure they'd protest to. As, why call Genie (I ask myself that many times
in the past, since, Usenet seems to have a much more knowledgable
and reasonable clientel) if one can get the info at no cost to the individual.
fair is fair... If GEnites want to read my postings, I certainly would
appreciate the opposite. So I vote "NO" to uplink only. And, as previously
stated the Usenet administration should at very least "know" about it.

4452. Res Changing

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 01:19:32 UTC
From: neil@cs.hw.ac.uk
Message-ID: <3995@brahma.cs.hw.ac.uk>
Source record: 245426

The other day Dave Baggett asked about legal resolution changes without the use of system calls like XBIOS #5. Derek Mui (Atari) said basically 'Naw can't be done'. I know GEM can't cope with rez changes.

Let us say that I write an application that if run in medium rez changes to low and set's the negative Line-A variables appropriatly (as does Neochrome). Just before exiting I restore things the way they were.
(Note: I don't use GEM while in the new rez)
BUT if my applictaion bombs out before normal termination we get dumped back to the desktop in low rez. Real bummer!
So we put in a terminate handler at vector 0x102 that restores the original resolution and Line-A variables. The question is: Can we call the XBIOS safely from here? If not then we will have to access the hardware ourselves and set all the variables normally affected by Setscreen. So where are these variables? Are they, as I suspect, more negative Line-A variables documented in S.A.L.A.D (Still Another Line A Document)?

Would someone at Atari like to let the cat out of the bag about negative Line-A variables? Please. It is Christmas.

BTW: Atari UK have yet to send me S.A.L.A.D (Bash, bash, bash ...:-)

> (and 6 expantion slots :-)

Thank you. Now I know that every one in this world does not assume that
DOS is the only operating system for an Intel xxx86 machine.

In fact from my experience, I have seen AT&T's UNIX, SCO's Xenix, IBM's AIX,
Microsoft OS/2, IBM's OS/2, CP/M, and I think PICK's operating system on an
IBM family Intel machine.

Now, what about for Atari. I hardly see people refer to much other than TOS.
But, at least we don't have the TOS only stereo type.

I have seen TOS, DOS, MINIX, OS/9, C-SH, Apple MAC OS, and CP/M run on the
ST, and do it well.

Kind of interesting trivia. Does anyone have any other operating systems to
add to the list?

I've come across a bug in xxed which was recently posted to comp.sys.binaries.st. When a file is saved (using 'save' or 'save as'), the dummy null byte at the end of the file is stripped off before saving and not put back on. If you continue to edit the copy in memory, it is possible that problems could occur when editing near the end of the file. To be safe, close the file after saving and then reopen it if you want to continue editing. I have rewritten the code to fix the problem but prefer to wait a decent period for reports of any other bugs before posting a second version with bugs fixed. jim...

4460. Commercial Networks and Usenet

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 04:14:39 UTC
From: gl8f@bessel.acc.Virginia.EDU
Message-ID: <1989Dec21.041439.24056@murdoch.acc.Virginia.EDU>
Source record: 245434

I'm not sure why people are so upset about the announcement of a feed to GEnie. To start with, we have many commercial services which offer Usenet, including uunet, Portal, the Well, and local-access Unix boxes which sometimes charge. This topic has been hashed over before when rec.humor.funny began to be offered on Compu$erve. It's here, you can't stop it altogether, and it's not necessarily a bad thing.

One thing I did ask Dave Small to clarify, though, was GEnie's compilation copyright. Obviously they cannot claim a compilation copyright on the compilation of comp.sys.atari.st articles, so they will be unable to stop GEnie subscribers from downloading all the c.s.a.st articles and putting them up on BBSes and whatnot.

If you don't want YOUR articles going to GEnie, you can place a copyright notice at the bottom with distribution restrictions.
In any case, can we fight about this on a news newsgroup instead of here?

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 05:03:00 UTC
From: <>
Message-ID: <89122504041763@masnet.uucp>
Source record: 245436

From: hugh@dgp.toronto.edu (D. Hugh Redelmeier)

I recently bought an HP LaserJet IIP for my 1040ST (and my Sun, but that is another story). To exploit the capabilities of the LJ, I bought a GDOS driver for it (TurboJet from Neocept). I am attempting to use it with Microsoft Write and EasyDraw.

The whole experience has not been very pleasant. I have encountered innumerable problems, many of which remain a mystery. This note contains both cautionary tales, and pleas for help. Perhaps I should mention that my 1040 has TOS1.4, GDOS 1.1, and EasyDraw 2.3. There is only one (released) version of MS Write.

- Using GDOS to drive the LJ seems unnecessarily slow. At least the first page of fairly plain text output takes a couple of minutes. In contrast, TeX drives the printer at close to its full rated speed, 4 pages per minute. [The TeX output bytes were generated by my Sun, but they were transmitted to the printer by my ST.] The key seems to be that the TeX driver downloads fonts a character at a time, ON DEMAND. Often, most characters in a font never get downloaded. The GDOS driver may not even use fonts, I don't know.

- Being an official Atari ST Developer, I thought that I might be able to write my own driver to solve the speed problem. ATARI sent me their GDOS printer driver construction kit. Unfortunately, it contains no documentation of the interface between GDOS and printer drivers! Neither does it contain documentation on the library of routines provided to do many of the driver tasks. There are several sample drivers for dot-matrix printers, so no doubt one could easily be mutated into a driver for another dot-matrix printer. This is no help in supporting the LJ well (i.e. figuring out how to download and then use fonts). Atari Canada said that what I got is all there is. Atari US says that it is a Big Deal to get more (proposal in writing for Big People to consider).

- When GDOS is loaded, MS Write will crash when I use upparrow or downarrow keys to cross a change-of-indent. This does not happen without GDOS.

- I tried to use GDOS with a large RAM disk. Apparently this left too little memory for GDOS. The symptoms were not at all clear and it took me a week to figure out the problem. The symptoms were that MS Write and EasyDraw were not able to display all the fonts they should have, and could print even fewer. GDOS or the printer driver made font substitutions with *no* diagnostic. As

you might imagine, I spent many fruitless hours playing with the assign.sys etc.

- MS Write seems to require all printer fonts to be loaded into RAM, even if they are not used. On a 1040ST, this means that you must hide some fonts from Write (don't list them in assign.sys, or don't have them in the specified files). Again, failure is indicated by printing with the wrong font.

- EasyDraw crashes when I try to save files. I found that this does not happen if I use an obsolete version of meta.sys. Migraph doesn't know why (but I only phoned them once).

- I sometimes use AMCGDOS (broadcast over the net from Germany) in place of GDOS. I have not really noticed any difference, but I use either version of GDOS as little as I can manage.

- The only PD font that I have found that comes in the resolutions I need is "Camelot". Unfortunately the 300DPI version seems to malformed: TurboJet won't touch it. Are there other PD fonts in screen and laser resolutions? I wonder if it would be easy to convert MetaFont (TeX) fonts to GDOS formats.

- Sometimes the 1040ST seems to think that the HPLJIIP is busy when it isn't. This is independent of GDOS -- it happens for normal printouts too. It only happens when the ST first tries to use the printer after the printer or the ST has been powered on (not every time; it may depend on which is powered on first). I presume that this is related to problems people have reported with HP DeskJet printers connected to STs. The program djreset.acc previously broadcast on the net seems to overcome this problem, but it is hard to activate it while running a non-GEM program.

Trying to discover the source of problems or find workarounds is very painful. There are just too many components and I have no tools to audit the interfaces.

GDOS is a tool that adds what should be an important dimension to the ST. Many feel GDOS should have been built into GEM, burned into the ROMS. The current licensing rules just seem to be a nuisance. Since AMCGDOS has been broadcast, all that is needed to avoid licensing is a collection of reasonable fonts and printer drivers.

GDOS as it is now is cumbersome and slow. For me, the worst problem is that I now have very little confidence in GDOS-based software.

Greeting-
Contact Microware in Demoines Iowa. They have a compiler that
will do the trick. Runs under OS-9 which is a multi tasking multi
user reatime romabel operating system that will run on any 68k
machine. I am surprised more people with ST machines don't run it.
I would be realy frustrated by not having OS-9.

Also check out the os9 forum on CIS as well as comp.os.os9.

MICROWARE (os9 Des Moines Ia.) (515)
224-1929

I have no conection with Microware I just use thier products on a 6809
based system with multiple windows and frequently two users at once.

>benefit from the arrangement, GEnie does and I am therefore against the
>practice. I'm sure that the powers that be in Usenet will not be
>pleased either. Just my $.02....

Powers that be? In Usenet??? :-)

At any rate, I fail to see how this should trouble anybody...I assume they're paying whoever they're getting the feed from for their trouble, and since it's a one-way connection (UseNet-->GEnie), it won't effect the bandwidth usage in the slightest...They are providing a service for their subscribers, who can use or not use the service at their own choice...If they don't use it, they don't pay for it. Who's being harmed in this transaction? Not the users of GEnie...those who don't use the service are not harmed, those who do apparently are willing to pay the price...UseNet as a whole is not harmed, since it's not adding to the bandwidth usage, and the system providing the feed to GEnie is not harmed, indeed they are probably benifiting from the additional income.

So...what's the problem?

Date: 1989-12-21 08:07:19 UTC
From: rs0@beach.cis.ufl.edu
Message-ID: <21556@uflorida.cis.ufl.EDU>
Source record: 245444

I am looking for info on using the cartridge port as an I/O port. I need D0-D8, A0-A15, and how the port does read vs. write (MEMR* and MEMW* lines line an InTel, or R/W* with clock strobe ala 6502). The docs that come with the ST have the pinouts for most of these, but the port direction control is not clear at all from their diagram. If you have to know, this is related to C/MRI project from Model Railroader (Computer/Model Railroad Interface), as now reprinted in Bruce Chubb's "How to Build a Universal Computer Interface". I know the port can be written to, otherwise how do you set all those nice clock carts? :) I may not use the info right away, but it will be easier to ask now than in 10 years or so, which is proabably get around to this.

4471. Atari Unix version for the TT, when???

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 08:11:32 UTC
From: hb9zz@ethz.UUCP
Message-ID: <2912@ethz.UUCP>
Source record: 245445

In Europe the Atari TT has to be released in january of the next Year
with the TOS 030 inside, but several previews of the machine speak about
an inproved version of the TT running Unix. Is that true? When will the
new machine be available? How much will it cost? And, most important,
will it be possible to run TOS as a Unix task?

I'll be grateful if somebody at Atari Corp. could answer my question

Greetings to everybody in the net

Marco Zollinger hb9zz@ethz.ch

4473. TT availability

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 09:14:27 UTC
From: t68@nikhefh.nikhef.nl
Message-ID: <674@nikhefh.nikhef.nl>
Source record: 245447

Well: Atari did it again.
When asking Atari about the availability of the TT in september
they said `november', then it became december. Yesterday I asked
my dealer and guess what: now it is februari. The machine is being
redesigned. Also TOS 1.4 won't come out officially in the Netherlands,
(as far as I was told). They'll rather wait for the next version.

If I were a mathematician I would have a nearly complete proof
by induction by now that the TT will never appear.

4474. Chaos Strikes Back - Monitor Problem?

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 09:47:26 UTC
From: lezo@syma.sussex.ac.uk
Message-ID: <1933@syma.sussex.ac.uk>
Source record: 245448

(In the UK) I received my copy of CHAOS in the post today.

I haven't had a chance to have a proper go at it yet but I was curious about the label on the front of the box. This says that my version is only compatible with 60 hertz colour monitors. Luckily it works with my Fidelity Colour Television Scart RGB Monitor but I guess if the labelling is correct a few people with only 50 hertz monitors could be in for a shock. There has been talk in this group recently about 50/60 hertz monitor problems.

So my advice is check your monitor and if possible try before you buy!

Is this going to be a significant problem or am I making a mountain out of a molehill?

>Has anyone done the editor vi on the ST?
>

Yes. It's called Stevie (ST VI?). I'm not sure where you'd be able to
get it from, though. I got my copy from the University of Lancaster, UK,
via a friend. I've only used it a little bit, and well, it's OK, but the
major reasons for using it in my eyes aren't yet implemented. There is no
global change facility ('ex'-type command), and the undo facility isn't
implemented yet. There are large chunks missing, really. It's also very
slow at doing inserts. I guess it's OK if you're hell-bent on using 'vi',
but I prefer to use micro-emacs (currently 3.8b, shortly to be 3.10)
for the simple reason that it's *much* more fully implemented.

Does anyone else know where Steve could get hold of Stevie in the US?
I've only got a binary, by the way. If necessary, I guess I could uuencode,
compress & post it. Any takers?

-Chrisl.

>advertising. (If you're a Net God, *don't* think of it as advertising!))

Your mileage may vary on this one, depending on which Atari subsidiary you have to deal with. I contacted Atari UK (some time ago, maybe I should try again) about the developers kit, and was told that in addition to the money I would have to inform them of my 'trading name', and would have to agree to keep them informed of what I was using the information to develop, so that they could ask me to stop if it interfered with their own internal or contracted-out development.

The concept that I might just want it for fun didn't seem to be one which they could grasp. Since I was unable to comply with the first condition, and unwilling to comply with the second on principle, I dropped the idea. (Though I occasionally toy with the idea of having my mother buy me a US developers kit (she's in Pittsburgh PA) and forwarding it to me.)

Source record: 245301

I would think this would be acceptable only if you modified the concept
to be somewhat like Sun-windows -- that is, JUST moving the mouse
pointer into a window would not 'top' it, but it would be auto-topped
if you then DID anything -- hit a keyboard key, press a mouse button,
... The auto-top would NOT eat the key or mouse press, but would top
the window and then pass the key or mouse-press through to it.

>Using Gulam and make, I want to link a program using TURBO-C.
>But there are so much .O-files that must be linked, that my list of
>files is not processed correctly. I think the commandline is limited to
>only 80 characters. It this a ST- or Gulam-limit?
>And how can I solve it?

It is clear that there is a limit, but it is bigger than 80 characters.
I did a simple experiment... I created 10 small files with long names,
names of the form "abcdefgh.00x", where x ranged from 0 to 9. Then,
from Gulam, I gave the command
vi abcdefgh.00*
The result was that I could edit some of the files, but the last one
had a truncated name.

However, when I say "echo abcd*", all of the names appear. I did
some more experiments, creating more files with names of the form
"abcdefgh.0yx" where y ranged from 0 to 2. It seems that Gulam
can expand much longer strings. For instance the commands
"echo abcd*" and "rm abcd*1? abcd*2?" worked correctly.

I interpret this to mean that whatever the internal limit for Gulam
may be, it is not the as short as the limit imposed by the interface
to the operating system.

In a recent article, Z4648252@SFAUSTIN.BITNET (Larry Rymal)
writes about his experiments with his disk drive.

| I took the drive apart and tried to lower the rpm with
| the potentiometer inside of the drive but Blood Money seemed to not
| notice anything. I checked the drive's speed qith QuickIndex15 again.
| Drive rpm still hovered at 301.

| ... I glued the dime to one side of the flywheel's center.
and asks:
| ... , can the dime's weight cause undue wear on the flywheel?

It would be a big surprise to find any wear on the flywheel itself. (smile).

I would worry about wear on the bearings if the weight is off center.
If it is off center, I would try to balance the it on the flywheel,
with say, a second weight glued at a diametrically opposite point.

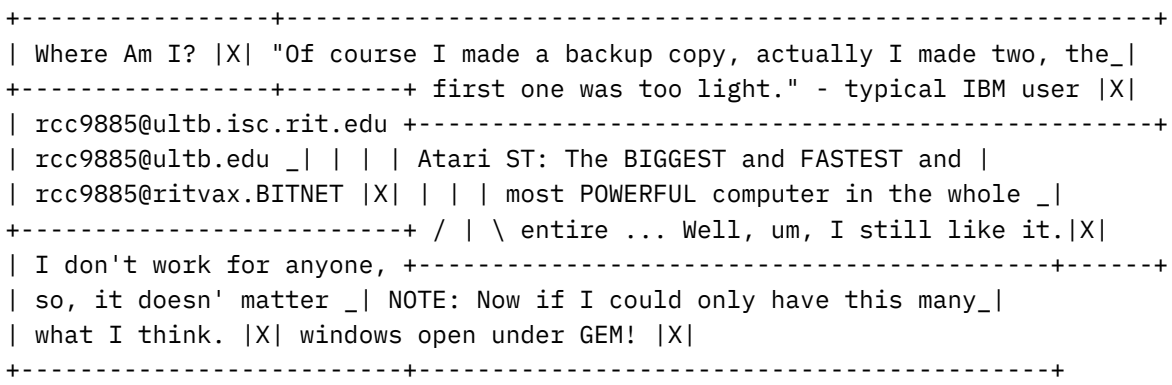
>I agree whole heartedly! This arrangement puts money into GEnie and
>does the net absolutely no good. Dave, you've done a lot of good things
>for the Atari community but please put a stop to this before it goes any
>further.
>

I think you are looking at this the wrong way!! So what if GEnie is
a profit orientented business. If you want to put up you own UUCP
site its going to cost you $$$. You would most likely then pass this
charge on to anyone who uses your system. They get USENET out of the
deal and you get money for up-keep.

Why is it that everyone has to get something from something. Why can't
you except the fact that this link will give you the ability to Email
to MANY MANY more people. In turn, they get to read comp.sys.atari.st,
where all the techie stuff is (ha! :))

I don't see how effects anyone single person in anyway other than allowing them
a wider communication area. Now I will be able to send mail to a friends
in Cape Cod and Connecticut FREE of CHARGE for me. Of course they have to
pay, but oh well. I don't see how you can look at this link any different
than the link you are using.



The only thing I would change is allow them to post to USENET, maybe mail
to some spooler that will post the message instead of mailing it..

I've been QUIETLY reading USENET for 2 1/2 years now, and have found it not
to be as HIGH tech (ST gurus) as its made out to be. I have found it
to be a GREAT source of information however, but only becuase I have had
the ability to MAIL my questions to someone at DC Utilities (Thanks guys!) or
some on at Atari, and now, Dave Small.

I think you all just want something for nothing!

Dave, its a GREAT Idea, and I hope you get mail working SOON!

I think the problem people are having is that Genie will make money
by selling access to the information in this newsgroup. However,
nobody who uses this newsgroup, some of whom can't afford or do not
wish to afford access to Genie, get no benifit from Genie, like a
download of information from THEIR newsgroup.
They make a profit, the people here on the Net get nothing in return.

Personally, I see their point. I subscribe to Genie and there are some
good files out there. I think that if we upload this newsgroup to Genie,
some reciprocation is in order. Otherwise, would we like to have people
who run a Net node in their bedroom, grab these notefiles, then upload
all of the stuff from here into a pay-for BBS running on a another
machine in their bedroom?
I don't think that most people on the net would like it if they knew
someone was making money by selling access to what is supposed to be
a freely accessible resource. By uploading to Genie with no reciprocating
arrangement, we would be allowing the same thing to be done.

4485. Usenet uplinks, Chaos Strikes Back

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 14:53:31 UTC
From: steveg@SAIC.COM
Message-ID: <8912211453.AA01434@SAIC.COM>
Source record: 245309

Add my name to the list against a one way link to GEnie.
While it might benefit the ST users there, I don't see a
benefit for Usenet, and further, why should GE profit off of
others' generosity? "Two way or no way".

On the subject of the new Dungeon Master game, I've just started, and
it's great to be back with 'my old friends' hacking and slashing
again. However, as I read INFO-ATARI16 digests, I can't simply skip
over messages with DM or Chaos in the subject line. Occaisionally my
eye catches key words or phrases before I can page down. As such, I
would appreciate minimizing info that might spoil the game for me and
others - for example, new beasties, puzzles etc. It's much more fun
to find them on your own (and then die quickly). Perhaps a
comp.sys.atari.st.chaos? Or maybe 'stuck' adventurers could post a
request for help, and then send specifics via e-mail to responding
helpers. My party and I thank you.

4486. Loneliness in the Atari World?

From: MBERNAR@ERENJ.BITNET
Message-ID: <8912220804.AA29176@ucbvax.Berkeley.EDU>
Source record: 245312

JOHNBARNES@ENH.NIST.GOV expressed some opinions about the future of this newsgroup which I mostly agree with. There are a few statements, however, which I don't agree with based on my own limited experience.

"I note that many of the questions that are asked here (at considerable expense, I might note) have been answered in the magazines."

I've found the magazines that are/were available in my area: STart, ST Log, STXpress and Atari Explorer are seriously lacking in technical information (I would exclude Dave Small's column in STart). Coverage of Public Domain and Shareware is inadequate. I've seen a letter to STart asking for a terminal emulation software for a Tektronix 4010 terminal go unanswered when Uniterm has existed for years.

"It appears that there is a tendency to post the burning question of the moment to the net when a little research in a library would yield a quicker and sounder ouutcome. Magazines like Current Notes and ST Informer, and to some extent z-Mag and ST REports, have solid technical information that is more useful than some of the spur of the moment responses that get passed around here...."

I have not yet found a library in my area (New Jersey) that has any of the ST magazines you mentioned. I can't even find one ST book in a library or a bookstore. Under the circumstances, this net is the best place that I expect to get informed answers to technical questions.

I wasn't going to comment on this thread, but since others are, I thought I might as well, too. I agree with those who have stated that the one way direction of info from Usenet to Genie is not fair. There is a two way mail capability with Compuserv and with MCI Mail, why shouldn't there be a two way capability with Genie...if they want it to be just for mail, fine...if they want to get more than just that, then they should give more, too.
The thing is--I like Genie. I gave up my Compuserv membership when they instituted a monthly charge (that really made me mad, considering they had enlisted my help previously to write to the Congress and voice my objection to an "access" charge...then after Congress did not impose an access charge, they went and instituted what was essentially an access charge to me, only they get to pocket all the $$s!), but it is much to their credit that they allow a two-way exchange of mail. I hope that anything done with Genie will be a "two-way street" as well!

From: paulm@ccicpg.UUCP
Message-ID: <51989@ccicpg.UUCP>
Source record: 245317

Well it seems that the LHARC is going to take over the atari archiving
world. I for one use a UNIX system for posting and recieving news
and binaries. I uudecode, and unarc on the unix system and examine
the stuff before going through the expense of going home, making a
LONG DISTANCE call to work and download the stuff. If LHARC is to be
the new standard (which I can see the benefit in smaller archives) I'd
like to get the source so I can port it to our UNIX system.
If the source is protected (which it seems to be) then I don't think
I'll be downloading any more files unless I know what to expect in them.

I hope that the source is available!
I think that the majority of readers on the net here are on UNIX machines
and would also like to get LHARC on thiers also.

Just my $0.02 worth.

After giving this topic some serious thought, here is my opinion.
I agree with the previous poster who stated that we either have 2-way
communication with GEnie or nothing at all. I think this would be fair,
where-as one-way communication is not fair at all. If two-way communication
is not installed or the USENET->GEnie uplink isn't removed I'd be willing
to cast an official vote (what ever that means :-) against the uplink.

[ ]
>Now, anyone who is on GEnie and reads this can decide they would rather
>pay a different provider of service. For example, in Seattle there are at
>least three companies that will provide Usenet access for a price.

Isn't only a matter of time before the NIXPUB listings are posted to
any/all of the GEnie conferences? They already appear on Compu$erve
and many uses on our local public access site here in New York
actually got information about the site from commercial services
as well as from publications they had to pay for.

Isn't it true that once a user spends a few hours downloading files
fromm a service he/she has to pay $5/hr to use and then discovers that
the same files can be downloaded form a public access site for a mere
$5/month, the thought would occur to that user that said files could
be more easily and quickly obtained using less $$?

I formerly worked with a lawyer whose personal reputation as well as
that of his law firm was being bandied about in "American Lawyer"
(also known as the "Inquirer" of the legal profession) and,
surprisingly, he was not, in the least bit, dismayed when he read the
articles and, in fact, he said "as long as they spell my name and the
firm's name correctly, it doesn't bother me at all - any publicity is
good publicity!"

Now, the question, who, if anyone or, what, if any corporation, could
ever control the information flowing through UseNET? They could filter
it, and edit it but as long as users can dial in to public access
sites they can't stop it or control it.

From: nelson@kodak.UUCP
Message-ID: <2239@kodak.UUCP>
Source record: 245320

Several posters have said words to the effect "Is GEnie that tapped out that they must raid USEnet?"

Ihe link wasn't GEnie's idea ... it was Dave Small's. And the idea was dissemination of information. Not to financially reward GE or Dave Small, or anyone else.

Oftentimes, the "Net's" postings are the best source of information on some subjects. I believe Dave's only intent was to spread the wealth of good, hard-to-otherwise-find, information with a segment of Atari ST owners who would be otherwise unable to access the information.

There's a lot of legal mumbo-jumbo which at this point prevents a true two-way link. Maybe someday in the future, the problem can be overcome.

But in the interests of keeping good information flowing to Atari owners who aren't in a position to access the "Net", I don't see why we should prevent them from reading our postings, wherever they may be able to access them - here or on GEnie.

Standard disclaimers apply.

In article <1989Dec21.041439.24056@murdoch.acc.Virginia.EDU> gl8f@bessel.acc.Virginia.EDU (Greg Lindahl) writes:

>One thing I did ask Dave Small to clarify, though, was GEnie's
>compilation copyright. Obviously they cannot claim a compilation
>copyright on the compilation of comp.sys.atari.st articles, so they
>will be unable to stop GEnie subscribers from downloading all the
>c.s.a.st articles and putting them up on BBSes and whatnot.

This is the part that concerns me the most. According to an author who specializes in books on copyrights:

``The matter of Dave violating or not violating the law is totally up to USENET, not the attorney general. You see, these laws are not enforced unless someone cries "fowl". I assume USENET does not mind if their messages are reproduced and put on another system.

If USENET doesn't mind, then there is no violation, because they have essentially licensed the use of their messages for other systems. Technically, all BBS' messages are protected under law from reproduction, IF the system states that access to the system is conditional (ie: use of passwords). Remember, an authored work is protected under copyright. Each message is the property of the owner of the BBS. It doesn't matter if the BBS contains programs, messages, or "books", they are protected under copyright unless the author/owner claims they are public domain.

Sure, it's wierd, but it's the LETTER of the law. However, you know as well as I do, it would be stupid to enforce for just messages.

I'm not saying Dave is a crook. I happen to like his products and his magazine articles. I'm just saying USENET could get him. I'm saying this to perhaps inform him, not to threaten him.

-- Richard Kelsch

P.S. How do I know all of this? Well, I spent 3 years researching computer law and talking to about every type of lawyer you can think of, so I can write my book. My book is called "HACKING: What's Legal & What's Not". It's for sale at E. Arthur Brown Company.''

It certainly does seem unethical for a network such as GEnie to upload, basically, public domain messages and then place an anthology copyright on them. In fact, maybe the restrictions will become even greater when

one considers the overall effect of GEnie's legal system. What about non-profit BBS's which have read-only nodes established with Usenet? They may become liable to *GEnie* who owns the copyright ...I am not saying that is the way it is, but that is the way it may become.

Regardless, the current GEnie-Usenet link does NOT represent an exchange of information: it is a hoarding of information. Two things must happen for this to become an exchange: there must be a free flow of messages between the two parties, all messages must carry a permission to reprint, and the receiving party may not copyright messages from the donor, or all messages must be placed in the public domain.

>(Computer/Model Railroad Interface), as now reprinted in Bruce Chubb's
>"How to Build a Universal Computer Interface". I know the port can be
>written to, otherwise how do you set all those nice clock carts? :) I

nope. its a read only port. hence the Atari name: ROM Cartridge Port. :-)

but you can develop ways of tricking the cartridge port to allow you to
do a write, which is basically how the clock cards are set on the ST. an
easy way of doing this is decoding a read from any address in, say the
$FA0000 range to be a 16 bit write to the cart port. thus, whatever address
with $FA in the upper 8 address bits can be turned into a write pulse,
(ROM4 is the strobe that's generated by the mmu i think) and use the
lower 16 bits of the address bus as the fudged data bus. not too pretty but
it works great.

(the addresses are off the top of my head, and may be wrong. mebbe someone
else can verify for me)

steve@thelake.uucp writes:
What is wrong with GEnie making the data available?
Is it that GEnie makes a profit? ...
Is it that GEnie charges for access to the data? ...
Is it that GEnie somehow prevents free access to the data? ...

None of these are the problem. Well, perhaps the 3rd, in a way.

Portal, the WELL, and a few dozen fee-based, NIXPUB-advertised sites all charge somehow, usually by the hour or month. So does UUNET, though I believe that UUNET is still formally a non-profit entity. (I could be wrong, though; I haven't thought about it much for quite a while.) So charging per se is not the problem, nor is the profit they gain via charging.

The problem is that they are not sharing back with the rest of us. As Steve Bellovin said in a note to me last March, one should "hold out for symmetry -- arrangements where they get the Usenet feed, but don't feed back, aren't cricket." (For those [few, I hope] who might be unaware, Steve is one of those responsible for the original shell-script-based implementation of what we now call Usenet, back in 1979.) UUNET exists for the express purpose of getting people to share; people on Portal and the WELL can always post. Not so with GEnie.

That is the problem - that they do not, cannot, share. All other things about them would make them a more-or-less ordinary net.citizen, but the lack of even the _potential_ for reciprocation is what makes the link undesirable. From what we've been told about the link, GEnie has absorbed Usenet postings into its "anthology copyright" (thereby, of course, making their copyright highly suspect as to its validity).

Also, as Brad mentioned, the lack of an email link is a really serious problem. Individuals on the other side of the gateway can't be reached at this point. Only by broadcasting to the Known Universe (of comp.sys.atari.st) can any single person be found on the opposite side of the gateway, no matter which side any given user is on. This is not a good idea on the Usenet. Standing in a crowded room and trying to have a private conversation with someone 30 yards away by shouting at one another is, shall we say, suboptimal. You wouldn't want to do it at the office, you wouldn't want to do it at a party, and you shouldn't do it on electronic networks. It would have been far preferable to build an email gateway first, and only then implement a news gateway.

If the link must stay (and I wish it would either go away or convert to 2-way), it is imperative that an email gateway be built immediately, without weird, hackish addressing schemes using extra fake headers and so forth. This can be done, and it's not even difficult, at least from this Internet side. (The amount of support from the GEnie side that would be required, I can't even guess.)

Message-ID: <1989Dec21.201152.4270@gpu.utcs.utoronto.ca>
Source record: 245327

I have the following problem. I have a Mega 4 ST with a dead internal disk drive. Fortunately, my hard disk autoboots, so I am not out of business, but I occasionally like to play a game which has to boot from a floppy disk (Falcon). Is there a way to get the Atari to think that an external drive is drive A? I tried installing the external drive in the place for the internal one, but it just spun and didn't boot. The connectors look the same for both, but the small connector (power?) had to be plugged in the other way around because the indexing slot was in a different place on the external drive. Since the light came on I presume that it was getting power ok.

So, does anybody have any ideas for what to do while waiting for the drive to be fixed? If someone has figured out how to get Falcon to run from a hard disk, that would be nice, too.

Barry

4507. Lynx protocol

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 21:03:18 UTC
From: tjm@nsscb.UUCP
Message-ID: <1180@nsscb.UUCP>
Source record: 245331
Cross-posted to: rec.games.video,sci.electronics,comp.sys.atari.st

Atari, expectedly, isn't forthcoming w/ any decent technical info
on the Lynx, specifically the ComLynx port, so now I turn to the world's
most secret pool of knowledge: you people on the Net!
I'd like to find out just how the heck data is sent over this thing.
The connector looks like an RCA mini phono plug, with 3 distinct areas,
check out below:

```
_____________ _
\------/ \
| | >
_____________/------\_/
```

I assume one section is transmit, one receive, and finally a signal
ground. I'm going to start my Lynx w/ California Games, which allows for
2 players, hook it up to an analyzer, and see if I can determine where transmit,
receive, etc. are coming from, and what the protocol is. I'm obviously making
the assumption this is a serial link, but I can't think of anything else
that'll make sense (which may just be my inexperience in this area, since
this type of hacking isn't my normal arena). If anyone has any ideas, insights,
warnings, ANYTHING, please let me know! There's scads of potential locked up
in this thing and I want to start getting at it!!!!

Thanks hugely,

Tim Murphy

I just purchased my 1040 ST , oh, about a year ago, and I can affirm
that it only came with Atari BASIC. Now, I hesitate to call Atari
basic an actual language, but I suppose you can technically call it
that. As for paying for such a thing...Ick! Anyone who wants to
program on their computer is bound to go and purchase a programming
language of their own, so when you get right down to it, it isn't
necessary to include a programming language with the computer. I
would have liked to have received a little bit more documentation on
the machine then I got, though. That little tan booklet they give you
covers the basics rather lightly, it would be nice to know more about
the machine without having to buy a book somewhere else.

There is no legal restriction to who may connect to USENET, therefore there is no binding vote that can restrict who may so connect. Further, since there is no legal restriction to who may connect to USENET, there can be no legally recognized distinction between sites. Thus site restriction messages in notices of copyright are legally meaningless. Yet further, there is no general information flow restriction that can be legally enforced for any site or group of sites.

But beyond those mere matters of legality and ethics (which refute the information stoppee's at every turn). Ask yourself this simple question. How long do you think GEnie users will sit still with not being able to post to the messages they can read from USENET?

4513. re: Usenet-->GEnie

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 23:34:20 UTC
From: karl@es56.UUCP
Message-ID: <8912212334.AA24630@es56.escd.uucp>
Source record: 245337

Why does everyone have such a problem with forwarding Usenet messages to Genie? There are already other services out there that provide access to Usenet messages for a fee. Not everyone has access to Usenet through their place of work.

No one will be forced to pay Genie for access to Usenet messages.

If anyone posting to Usenet doesn't like the idea of people having to pay, then they can choose not to post.

The beauty of Usenet is that it is difficult for anyone to force their form of tyranny on anyone else.

That is my two cents worth. Copy me directly on any replies -- I am waiting by my mailbox with a bucket of cold water.

4514. GEnie uplink is shut down..

Newsgroup: comp.sys.atari.st
Date: 1989-12-21 23:57:02 UTC
From: dsmall@well.UUCP
Message-ID: <15158@well.UUCP>
Source record: 245338

After receiving mail on some concerns people have had with the
USENet -> GEnie uplink, I've gone ahead and shut it down. It won't be back
up unless those concerns are resolved to everyone's satisfaction.

Concerns raised included --

Would GEnie be a 2-way site? Many did not want to see information
going only one way. I agree; it should be 2-way. I will say it's necessary
to show the potential such a link has before it could be developed from its
present kludge to a good link; that's now been done.

Would there be e-mail exchange? This is not a big technical problem,
and I think it needs to be done, as many notes said.

Would GEnie put some sort of anthology copyright on the notes? I
very much don't want that, and neither did several other people. Obviously
we can't have that.

Most of the writers were in favor of the link *provided* there be
no copyright hassles, no for-profit on my part, and that there be email and
a 2-way link -- in other words, GEnie become a regular site. I see their
point and agree.

I've found in working with organizations that one example can be more
effective than thousands of words (the old writer's adage of, "show, don't
say".) As soon as everyone gets back from holiday vacation, I can show GEnie
management the benefits for everyone in such an information exchange, with
the present; many GEnie people very much want to be part of the Net. While
I don't speak for GEnie, I have hopes that something can be worked out that
will be satisfactory for everyone. The WELL and PORTAL, both of which I'm on,
do charge for USENET access, but I consider that entirely fair; they have
equipment and staffing costs, and aren't really gouging anyone. I think
it'd be a good thing if we could GEnie to operate in the same fashion.

There were concerns that the volume of notes back from GEnie would
stress the net. I don't want that, and I don't want a thousand "How do I beat
Level 7 on Dungeon Master" notes on the Net, either.

Finally, a few writers missed the text on the original note where
I said that I make no profit on these notes; the (not large) royalties made
on the GEnie Gadgets support area are all donated to non-Gadgets volunteers
who maintain the place. I am not allowed to divulge royalty rates, but this
is a really low amount of money -- hardly some sort of "gold mine".

Overall, I'm sorry for the misunderstanding; looking over my original
note, I can see I wasn't too clear on my intent, which was working towards
bringing GEnie into the Net two-way, with email, without copyright problems.

I hardly want to be sneakernetting messages the rest of my life (*sigh!*), it gets old real fast.

A few writers mentioned some hassles with Compuserve; I am completely unfamiliar with that story. Ditto with BIX.

Anywho, look, it's the holidays, and we all have a lot better things to do than worrying about this. I think the GEnie people I've talked to (who seem pretty sane) will see the potential for *mutually* beneficial information exchange; the link won't reopen until these concerns are worked out to everyone's satisfaction (that means, you'll see it here before anything happens, so there's a chance to discuss it).

If I've offended anyone, my apologies; it certainly wasn't my intention to do so. I wanted to demonstrate that the technology to link nets in a good way was here, not cause any fuss or trouble.

I very much appreciate those who took time to write email explaining points I hadn't thought of (e.g., anthology copyright). Several notes spoke highly of Richard Stallman and the FSF; getting to talk with Richard at length was one of the highpoints of Hackers for me, and I know a good deal about the FSF. (He certainly doesn't get much good press in the computer trade journals -- most don't even stop to *listen*). What can I say ... I'm a card carrying EMACS user.

So to recap, many users raised points I feel are completely valid, had not thought of, and I've responded by dropping the link until such time that it's resolved in an acceptable way. (That means acceptable to you, not to me, ok?)

I'm very pleased with the number of people who agree that GEnie as a site is a good idea, provided it's a full, two-way information exchange. The idea of information exchange is alive and well. I also appreciate those who took the time to write before doing some sort of public primal scream; in my experience since '76, screaming on nets feels good, but it's the quiet and calm voices that get things done.

It's time to go Christmas shopping here. We here wish you all a happy and safe holiday, and our best wishes for the new decade!

-- thanks, Dave / Gadgets by Small

p.s. I'll keep you informed of anything that happens relating to this link; however, don't expect rapid action -- you know how bureaucracies are. Also, everyone's off for the holidays in any event.

4515. Re: Res Changing (really terminate handler)

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 01:18:20 UTC
From: apratt@atari.UUCP
Message-ID: <1912@atari.UUCP>
Source record: 245339

neil@cs.hw.ac.uk (Neil Forsyth) writes:
> [Bulk of question deleted.]
>So we put in a terminate handler at vector 0x102 [...]
>Can we call the XBIOS safely from here?

Yes. I wrote an off-the-cuff article "all about terminate handlers"
on GEnie, then asked John Townsend to post it here. I don't know if he
has, but among other things, it says you can make BIOS and XBIOS calls
but not GEMDOS calls.

I didn't follow the recent discussion on Chaos Strikes back. I gather that it lives up to expectations from Dungeon Master which I haven't played yet (I have it from a good source that I'm getting this for X-mas).
But, I thought I saw some discussions about a bug in Chaos...

Could some kind soul please summarize to me? I had to go through my info-atari digest quickly as I was low on disk space. Now, I can't look it up.

Thanks in advance.
Marcelino Bernardo

>to that information - for a price. Usenet offers the same but the price
>is different. In my case, a company that I own part of foots the bill for
>providing Usenet services to employees as well as feeds to other
>companies. Other companies provide Usenet access for money.

A one way link is simply unfair. Two, way I have no objections to... But,
others may. Let me make a fairy tale example. Suppose some chap runs a
pay BBS somewhere's, and also has Net access. Lets say he grabs all the
goodies, places them on his BBS and charges people to see the info. Is that
fair? If I post info/solutions whatever the case may be, I post it for the
public... free of charge. I do not see GEnie calling anyone of us, more so
the companies that foot usenets bills offering "a slice of the pie".
I see no offers of "free exchange" of any GEnie info. In fact its been said
that GEnie applys copyrights to info/files etc. So, if I post a code stub,
or function lets say, and it ends up on GEnie it is copyrighted by them?
This is america, while the word "free" may have went through some changes
in 200 years, it does not mean "free to those who can pay". And, esentially,
that is what we have here.

4520. Improving this newsgroup

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 04:38:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <8912220809.AA29701@ucbvax.Berkeley.EDU>
Source record: 245344

I accept Marcelino Bernardo's statement about the inadequacies of the glossy ST press when it comes to real technical information. My reference to a library included things like the Abacus and Sybex books as well as source codes to true public domain programs.

Many of the questions asked here, however, do not fall into the category of technical information. A number of them are from beginners who might do well to read Ralph Turner's Help Key column in ST Informer or his "Atari ST Book".

Those questions that are of technical nature, such as the one about ringing the bell from GEM, oftewn receive rather terse answers that take a lot of work to implement. It would be nice to see these as more extended articles and to have these archived somewhere.

The Atari community being what it is, we also see a number of cries for help coming out of utter darkness. The newsgroup serves a valuable function in giving these people a community that they can belong to.

One difference between the 8-bit days and modern (ST) times seems to be that programming has become more complicated and people are less willing to share their knowledge openly. Of course in those days we really didn't have "developers" because Atari was just a game machine. Nowadays we see oodles of "public domain" software but very little source code.

Ken Badertscher sometimes seems to feel that the only programmers worth talking to are the ones who are initiated into the Masonic Lodge by paying the fees and learning the secret handshakes.

Atari needs every bit of help it can get. Every program that actually gets written and that does what it is supposed to do is one more reason to buy Atari. Information that will help accomplish this should be disseminated as widely as possible. This newsgroup is one way of doing that and it could become a truly valuable resource if we could put some more punch into the discourse.

> I hear there is revision 2.3 available ? Where did you get it ?

In Germany, You get it from Weide in Hilden. V.2.3 does not seem to differ much from 2.2. In fact, it comes with the docs for 2.2. The version is nearly 2 years old. I don't think it is worthwile to upgrade from 2.2.

In February, the Absoft people wrote me they were working on an extended version of the complier including NAMELIST. Has anyone heared if this version has been released?

BTW: does anyone have informations on the state of Fortran 8x? Has it been released finally or will be x.ge.10 ?

I don't know about on the ST, but I have a vague recollection that some implementations will accept a '/' or a '+' to force continuation on the next line.

-Don't flame me if I'm wrong, I'm just trying to help...

Have a good Christmas all,

4527. Populous probs

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 15:45:55 UTC
From: jonathan@hcr.uucp
Message-ID: <1989Dec22.154555.11166@hcr.uucp>
Source record: 245351

I know this was discussed some time ago, but I recently purchased Populous -- neat looking game, incidentally -- but it doesn't load properly. The demo works quite tantalizingly (?) but the actual game never loads. I've checked my floppy rotation speed, and it's 299: pretty much bang on. I've got an ancient 520 (1 Meg) and a DS drive.

Basically what I'm asking is: is there a hope for me, or do I try to return the game?

A plague on EA and all their descendants for their nutso copy protection...

4528. Re: Res Changing

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 16:15:33 UTC
From: kbad@atari.UUCP
Message-ID: <1913@atari.UUCP>
Source record: 245352

Neil asks if there are magic negative-offset line A variables which can be stuffed with appropriate values to fool GEM if an application changes res.

The answer is: No.

The line A variables are essentially the BSS of the VDI. The AES, on the other hand, has no published variables. Never had 'em, never will. So you can diddle with line A variables all day long, but the AES will still be working in the original resolution when it's time to show a menu, or draw a window, or put up an alert box.

Derek Mui is very wise in the ways of the AES, and when he says there is no way, legal or illegal... believe him!

4529. v09INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 16:22:33 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <35010@grapevine.uucp>
Source record: 245369
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 9, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, please send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
much means arc and zoo. If you want to use a nifty new archiver, make the
source code available to the public (posting to comp.sources.atari.st is
```

fine.)

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v09INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v09i081: crayemu -- Run Cray-3 programs 30% faster

identifies this as the 81st binary article in Volume 9. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v09i041: stvme -- Turn cartridge port into a VMEbus part04/18

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 9, Issue 80
Archive-name: free

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

volume3/sttar Unix-style TAR utility
volume3/chekbook/part01 Checkbook manager
volume3/chekbook/part02

volume3/filespy Text file viewer
volume3/astro18/part01 Version 1.8 of astronomy program
volume3/astro18/part02
volume3/astro18/part03
volume3/d110edit D110 (MIDI synth) patch editor
volume3/shadopat.11/part01 Patch for Double-Click "shadow" program
volume3/shadopat.11/part02
volume3/shadopat.11/part03
volume3/shadopat.11/part04
volume3/dcfrmt30 DC Floppy Formatter 3.0
volume3/dcfrmt30 DC Format disk formatter v3.0
volume3/fsck Filesystem consistency check/repair
volume3/risk/part01 Game: take over the world
volume3/risk/part02
volume3/risk/part03
volume3/risk/part04
volume3/dcstuf09 DC Stuffer -- load more than 6 desk accs
volume3/nlqps2 Near-letter-quality printing (w/ font editor)
volume3/gstlink Faster linker for GST object files
volume3/arcgsh14/part01 Version 1.4 of graphical shell for ARC
volume3/arcgsh14/part02
volume3/vkill2/part01 New version of virus killer
volume3/vkill2/part02
volume3/vkill2/part03
volume3/tess Game: Beyond the Tesseract (adventure game)
volume3/mx2v230/part01 Multitasking kernel with utilities
volume3/mx2v230/part02
volume3/mx2v230/part03
volume3/mx2v230/part04
volume3/mx2v230/part05
volume3/gulam/part01 Command line interpreter and editor
volume3/gulam/part02
volume3/gulam/part03
volume3/gulam/part04
volume3/newword/part01 Desk accessory text editor
volume3/newword/part02
volume3/newword/part03
volume3/leolife The game of Life
volume3/limiter Limit uppermost hard disk device letter
volume3/sel_prog Miniature shell for launching programs
volume3/stdcat40/part01 Version 4.0 of disk catalogging system
volume3/stdcat40/part02
volume3/stdcat40/part03
volume3/gulam405/part01 Version 1.03.04.05 of GULAM shell
volume3/gulam405/part02
volume3/gulam405/part03
volume3/gulam405/part04
volume3/gulam405/part05
volume3/passm Logic circuit (PAL) assembler
volume3/sc_bin/part01 Sozoban C compiler binaries

volume3/sc_bin/part02

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: October 13, 1989

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, a new archive program called "zoo" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others. Unfortunately, you can't unpack a zoo archive with arc, or vice versa.

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its archives.

Using Binaries -3-

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the

archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know

about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

4532. Re: USENET -> GEnie uplink now working

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 17:09:10 UTC
From: steve@thelake.UUCP
Message-ID: <1122891109106332@thelake.UUCP>
Source record: 245353

In article <34975@grapevine.uucp>,
koreth@panarthea.ebay.sun.com (Steven Grimm) writes ...

>... The only way I'd support this would be if someone would write a
>quick newsgathering/reading program for the ST, and put it up in GEnie's
>program section. UUPC will mostly work as a base for this.

My UUCP system (thelake) runs under TOS on a 520ST with a memory upgrade and a homebuilt hard drive, and it handles news. There are many software combinations that can put an ST on the net. I'll describe the one I'm using at the moment.

A couple of years ago, Dale Schumacher (dal@syntel.mn.org, of dLibs fame) hacked together a UUCP mailer called UUMAIL. It has some shortcomings, but it's quite servicable and easy to set up. I think there are eight or ten Minnesota sites currently using it. Many are fed comp.sys.atari.st repackaged into mail messages by a daemon program at stag.UUCP.

About six months ago, I got interested in building the tools to put "real news" on the ST. With some advice from Dale and John Stanley, I wrote an rnews program for UUMAIL that can process batched (not compressed) news, and a postnews program that creates RFC1036-compliant headers and pops them into a text editor. About the same time, John wrote a really nice program called UUREADER that organizes mail and news messages into a tree (unlike Un*x systems, all this software works out of one big spool directory). Kent Schumacher rewrote his UUVIEW file pager to work with UUREADER. Although the resulting combination seems to have entered a phase of endless beta-testing, it does work pretty well.

There are other irons in the fire, too -- and I expect that Smail and C News eventually will be implemented under TOS, perhaps with multitasking extensions, as well as under ST-Minix. I'm not directly involved in those projects, so I'll leave it to the iron-tenders whether they want to explain the status of their projects. I mention it only to assure people that even though a lot of users are going to latch onto Unix as soon as it and the TT are available, the mad hackers of the world aren't going to abandon TOS.

There are, of course, other solutions. Beckemeyer sells a multitasking UUCP package that may or may not handle news; STadel BBS does UUCP and news; bill@meadow.UUCP said some months ago that he has a working implementation. There may be others.

The real impediment to net access is not software, but rather finding a newsfeed. Some of the people who have posted the most flamage on this topic work for big commercial operations like AT&T and Eastman Kodak. Free

this, free that, etc. (I'm eagerly awaiting my free phone service and film processing.) Perhaps those sites are willing to pass out UUCP connections and newsfeeds like candy at Christmas. Send them e-mail, not me. :-)

>(Falcon). Is there a way to get the Atari to think that an external drive is
>drive A? I tried installing the external drive in the place for the internal
Disconnect the cable from the internal drive and then swapp the "drive select A" and "drive select B" wires on either the floppy round connector on the back of the ST or on the round floppy connector going into the external drive. You can get the signal names and pin numbers from the back of the users manual which came with the ST. If know what your doing enough to swap the wires in the right place then you can do it without having to disconect the internal drive. If you leave the internal drive connected and swap the lines in the wrong place then you'll end up with both drives "driving" the ST at the same time.

Too bad about your floppy drive...

>So, does anybody have any ideas for what to do while waiting for the drive
>to be fixed? If someone has figured out how to get Falcon to run from a
>hard disk, that would be nice, too.
>
>Barry

All you need to do to run Falcon off your hard drive is to copy the floppies. It runs with no trouble, as long as you run the startup program from your AUTO folder. (Can't have *anything* else in memory. Kind of a drag, sometimes, coldboots are inconvenient...)

Actually, it's not *quite* that simple, if you want a convenient setup. Falcon doesn't specify any directory pathnames when it looks for its data files, so all necessary files must be located in the default (or "current working") directory. When programs run from the AUTO folder, the default directory is the root directory of the boot device/partition. Obviously you don't want to clutter the root directory of your hard drive with a lot of junk, you'd like to have the Falcon files stored in a subdirectory. (Like, D:\games\falcon, as an arbitrary example... }-)

The solution I use is two-part. First, Falcon *must* be started from an AUTO-boot. So, I have two AUTO folders on my hard drive. I have to rename the one I want to use to "AUTO", then reboot, to get things going.

I stick all the Falcon files in a subdirectory. In my Falcon AUTO folder, I have a 3 line program that calls Dsetdrv() and Dsetpath() to set the default path to my Falcon directory, then Pexec()s FALCON.PRG.

This works for Falcon 1.0, 1.1, and Operation Counterstrike. I keep Falcon 1.1 and Operation Counterstrike in d:\games\falcon nowadays, and select which to start with the AUTO program.

Falcon takes about 3 seconds to load on my Mega 4. It's quite nice, not having to deal with inserting additional floppies & such to play a game... Also, you don't need the code-wheel when you boot from the hard drive. (I hated the damn thing anyway!)

Last note - I have a sneaking suspicion, if I grabbed TopDown and installed it, I wouldn't have to worry about loading Falcon from the AUTO folder. The Falcon loader program is non-relocatable, which is why you can't have much else in memory when it starts up. It also won't run with the ICD boot code, because they try to use the same memory space.

>like to get the source so I can port it to our UNIX system.
>If the source is protected (which it seems to be) then I don't think
>I'll be downloading any more files unless I know what to expect in them.
>
>I hope that the source is available!
>I think that the majority of readers on the net here are on UNIX machines
>and would also like to get LHARC on thiers also.

I have the source for LHARC. I haven't bothered doing anything with it yet.
It's 80% 8086 assembler. Even the C source code is full of ASM compiler
directives. Most of the comments are in Japanese, for a Kanji character
set, and show up as weird diacriticals on an ST display. I doubt any
printer would like them very much.

I haven't seen very much of anything archived with LHARC, which is why
I haven't been too eager to look at it. Is there really that much demand
for it? Maybe a show of hands (}-)) for people saying "yes, I've used
it, I like it" ? I've seen discussion of LHARC on GEnie, they weren't too
thrilled with it because the ST version was slow, buggy, and incompatible
with the PC version. I think that's changed recently, with a new ST version,
but I haven't paid it too much attention.

I'm still waiting for SEA to send me the ARC 6.02 sources. I sent 'em a floppy
months ago, a few messages on CI$, made a few phone calls and left messages
that way, and now I'm in limbo, waiting, waiting,
waiting... Needless to say, I'm somewhat perturbed at them. They just sent me
a copy of their newsletter, which mentions the Atari ST and Unix versions of
ARC, (as well as all the other systems it's been ported to) but no credit to
the respective authors, or even any indication that the work was done by
outside people. (To be fair, they don't blatantly claim it as their own, either.
Just mention the existence of such, not how it came to be...)

Message-ID: <937@uhnix2.uh.edu>
Source record: 245359

Graham Thomas writes about an auto window topper for the desktop...

Graham,

I wrote such a desk accessory over a year ago, and I found several problems when using this at the desktop and in programs.

Of course I do know more about the machine now, but these are what I found back then:

At the desktop:

The window would come to the top, but the OS wouldn't change the directory pat so you had 'weirdness' do to that.

Any program previously selected in the active window became deselected when the new window was automatically topped. Therefore, you couldn't copy very effectively, or do something like a 'show info' because the file would be deselected before you got to where you were going...

I did sorta change it such that if you had the right mouse button down it wouldn't auto-top, but whats the point? That's more work...

In programs:

The window became topped, but unfortunately the bottom window was still the active one (or so the program thought).

In a word proccessor, this is kinda funny, because your cursor and block highlights are no where correct for the current window, but rather aligned with the bottom window...

All in all, I thought it was a neat idea, but it turned out to be pretty useless (at least back then). Maybe if I get the chance, I'll look into it again...

is rather small)

>-> It's time to announce that there is now a working uplink
>-> from USENET to GEnie.
>
>I object to this ONE WAY transfer of information.

Sigh. We just did this with Brad's r.h.f group. There was a four
month flak about him gatewaying jokes onto GEnie. The net effect
to Usenet was zero, presumably GEnie users got something out of it.

No one person can say ``this will stop NOW!'' If you feel
strongly, put something in your .signature file like:

``Redistribution to GEnie prohibited''.

This prevents YOUR postings from being propagated to GEnie. If a lot
of people do this, it will send a message to GEnie. If a lot
of people don't do it, it will send a message to USENET.

4540. Re: GEnie uplink is shut down..

>I've gone ahead and shut it down. It won't be back
>up unless those concerns are resolved to everyone's satisfaction.

Everyone implies unanimity -- one disenting voice would therefore be enough to kill it.

Why don't you rephrase it, "it won't be shut off unless EVERYONE wants it shut off."

Your selection of one sentence over the other is arbitrary.

> Many did not want to see information going only one way.

Tough cookies. You shouldn't let people brow beat you. Doing the right thing does not always win you popularity contests. Sometimes you have to be a moral/ethical leader rather than a follower. This selfish group of USENET whiners is in desperate need of a model to emulate. You have the credibility to be that model.

> Would GEnie put some sort of anthology copyright on the notes?

Come on, this is a joke, right? I mean I expect a little legal ignorance on the net, but this is hilarious.

>no for-profit on my part

Caving in to those socialists out there, ehy? Are you going to give up making a profit on other areas of your life to please them also? And why is "profit" always defined in green-backs? Do not all the users of USENET and GEnie profit? If they didn't wouldn't they quit using those services. But back to green-backs. No one has answered my question about why telephone companies, computer companines, modem companies and software companies can all make money off USENET sites and GEnie can't.

You guys are being completely arbitrary -- you cannot justify your arguments.

> I don't want a thousand "How do I beat Level 7 on Dungeon Master" notes
> on the Net, either.

What has this got to do with anything? What is this, Small's version of the Canadian Content laws?

>If I've offended anyone, my apologies;

I should be offended by your whimping out and leaving the GEnie user in the information poor house. But they are the ones really hurt by your caving in to the selfish USENET whiners.

>acceptable way. (That means acceptable to you, not to me, ok?)

Hey, your off to a bad start if you are trying to please me. Remember

>--
> $ Chris Dreyer St. Gall Graduate School for Economic and $

It *should* be the point.

First of all, I agree *in principle* with the complaints about
GEnie using USEnet articles for profit and not reciprocating.
This posting is an attempt to represent the other side of the
coin...the side (I'm guessing) that David Small saw when he
proposed this uplink to the GEnie community.

I've been on GEnie, I still am on GEnie, and I see the kind of ST (and other)
information that is on there...and I feel that USEnet info is far
superior. The conversation threads make more sense, I get a lot of good
technical info, etc. GEnie postings consist mostly of non-technical
non-informative conversations....there are the odd exceptions, like the
RT discussions that Small holds, etc.

Let's face it, USEnet is a community of profession CS people, Engineers
and scientists - as well as students and graduate students in those
areas...GEnie consists mostly of home hobbiests, business professionals,
and (generally) non-technical types.

It seems to me there *would* be a benifit to the Atari community by allowing
USEnet info to go wherever it is needed.

In addition, there are 10's of 1000's of people who can *not* get access
to USEnet, would you deny them our info/rumors/conversations/etc?

Source record: 245364

Well, I was annoyed at first at providing info to a profit organization, but think of it this way: the Net is a *free* information source. Would you object to genie loading on other free info sources, such as pamphlets from the US govt, transcripts of press talks, written works out of copyright, etc? The point is that the info published here is FREE to everyone, and that INCLUDES corporations, governments, and places that charge for making this info convenient to their clientele.
Remember, they are charging not for the info itself, but for making the information available in one place to the users who are interested or who may not HAVE another way of getting to this source.
I have access free but my company pays an access fee (I believe, and it would be the same for genie). If my company wanted to pass this cost on to the employees who use the service, would that be wrong?

Disclaimer: I do not use Genie, nor do I work for Genie, nor do I know anyone who is in any way related to Genies, Djinn, Efreets, etc.

4544. summary on ICD autoboot problems

Newsgroup: comp.sys.atari.st
Date: 1989-12-22 23:22:23 UTC
From: parker@vlsic2.vlsic2.ti.com
Message-ID: <103527@ti-csl.csc.ti.com>
Source record: 245365

I earlier posted a message asking about problems I was having with the ICDBOOT.PRG and trying to disable the autoboot from the hard-drive. Thanks to everyone who replied and with their help and some luck of my own, I have managed to solve it sort 0f...

With my ST (1040 with TOS 1.4), the following sequence would allow the ST to boot completely from the floppy disk, ie. not using the AUTO folder of the hard drive boot partition.

DO a cold boot, and wait for the Floppy drive light to come on and then go off again. Now press and hold down Ctrl/Alt/Shift until the hard drive light flashes on an goes off. Now release the keys and the computer will continue to boot reading the floppy.

One more thing to note. If you have ICDBOOT.PRG in the AUTO folder of your floppy, it will be read no problem, but the computer then goes to hard drive and installs whatever accessories are there for a hard-drive boot.
If you want to come up with the accessory arrangement on your floppy, the easiest thing is to remove ICDBOOT.PRG from your floppy AUTO folder and run in manually after you have booted. You can then access your hard drive no problem.

I'm sure there are more elegant fixes than this, but... I also had several people say just get SUPERBOOT or G+PLUS, etc., and forget about it.
Probably good advice.

Anyway, there is the summary of what I discovered.

Thanx again,

james parker

>-> exchange possible between these networks; [...]

In this case, the maximum is not enough to allow the minimum.

>I object to this ONE WAY transfer of information. Dave talks about the
>*exchange* of information. This is not an *exchange*, it is a one-way
>transfer of Usenet information. I object to the rape and plunder
>(*for profit*) of Usenet! A summary of Usenet, or perhaps ``this is the
>latest from Usenet'' (1 or 2 articles follow), is acceptable. This wholesale
>plunder of Usenet is not.

I must second this opinion. Unless the 'article' link is both ways,
forget it.

>-> I wanted to let you know to prevent invading anyone's privacy.
>-> [...] If someone has a real need not to have their notes forwarded to
>-> GEnie, I will be happy to put a "filter" on to prevent it by request; [...]

Thanks Dave. It would have been genuinely dishonest to make this
link and not tell anyone... but I would have preferred discussion before
the event, not after. Oh, well, at least we get to discuss it now.

>I think this should be changed to ``only take articles from Usenet if a
>person sends Dave his *approval*''. Why should I have to trust Dave to remove

>my articles? What if he misses one? What if my mail can't get through?...

If the link doesn't go away as I want it to, I think this is an acceptable alternative. Post only what has specific permission to post.

(If you read this Dave, This is the ONLY one of my postings which I wish to go to GEnie. NO OTHERS may. Attempted mail to follow.)

>I also object most strenously to Dave limiting MY access to information by
>scaring away Usenet posters who don't want the kind of publicity GEnie
>offers. Usenet is supported FREELY by a conglomeration of machines (each
>company covering a bit of the expenses) and I object very, very much to
>GEnie profiting from other sites' generousity.

I'm afraid I don't understand this statement. Publicity?

>-> It seems to me like a benefit for everyone involved, especially
>-> if/when 2-waymail gets going.

No objections, only encouragement for a mail link (both ways, of course). Dave, there is a mail link to CompuServe, but I don't have any details. Mail is fundamentally different than posting. It is an exchange between 2 people, not 2 organizations.

>-> [...] other areas on GEnie are
>-> expressing great interest in having a USENET uplink. Basically, folks,
>-> USENET is perceived as the place where the people who know what they're
>-> doing post notes.

But have any USENET groups expressed interest in having their group uplinked to GEnie? Have any USENET groups even expressed interest in a 2 way link to GEnie. If USENET is preceived as the place for those who know their stuff, why did those others get GEnie accounts instead of accounts on public USENET machines? I know of only 3 (portal, madnix, and macc), but there must be many other machines out there on which anyone can get an account.

>Does this mean that soon *all* Usenet groups are going to be appearing on
>GEnie? I hope we can stop this before it gets out of hand!

Agreed. Stop this now.

>-> Why do it? Because a long time ago, on the CERL site on PLATO, a
>-> person named Sherwin Gooch, ex-PLATO, ex-Atari, and now with Apple,
>-> introduced me to the hacker ethic and freedom of information exchange as
>-> its primary goal. (No, not illegal exchange, you know what I mean). [...]

Sounds like a defferent hacker ethic than what I was raised on... I don't follow any of that crap they fed me when I was younger.

>-> If anyone feels this is wrong, I'll be more than happy to listen and
>-> if convinced, drop the link. [...]

I think you're getting an earful of what we think.

>Write Dave Small and voice your objections TODAY, before it's too late and
>Usenet becomes GEnie (and you have to pay through the nose for what was
>formerly free)!

Sorry. Emotional argument of this type doesn't cut it. I don't believe
that USENET will cease to exist because of this link, but it won't help
it any either.

>-> Well, enough said. I hope this leads to good things -- GEnie users
>-> getting good information on time, for instance.

Dave, you are known to us as a doer of good things. Your reputation is
impeccable, at least in your business dealings. I believe that you
intended to do good by this, but I believe more strongly that,
ultimately, this will do no good for those who are generating the
information that you wish to pass along, instead doing good for persons
having no real connection with the originator.

>The more Usenet becomes publicized, the greater the danger of someone in
>political power becoming ``concerned''. Perhaps concerned enough to pass
>legislation like that currenly up for review in New York: a sysop must
>validate each and every *message* that is posted to his BBS and must also
>guarantee privacy of the message and guarantee that the message NOT appear
>on any other service.

Bad news to me. Blast this and other similar legislation, except for
privacy of private email. Also unenforcable, as no sysop can guarantee
that no person ever will download a message and upload it somewhare
else. Make the originator responsible for their postings, not the
sysops.

>Is there anything (legal?) that we can do to stop this link? In general,
>are there any ``net rules'' for this type of thing? Is GEnie in any danger
>by uploading Usenet articles wholesale?

I hope that Dave will understand our sentiments and close down the link
until such time as the Net Gods can pass judgement. I would think that
any postings which specifically say that their information may not be
distributed for profit would be incorrect for uplinking, as GEnie would
be profitting from their posting to USENET. This pretty well leaves out
any of the binaries and sources groups, as well as most of the code
fragments in postings. As Dave does not profit, he should be in no trouble.
Who will monitor every message to be certain which may be distributed and
which may not be? That is what it would take to ensure copyright
compliance.

4546. Malloc on 2.5 Meg 1040stf - help needed

Newsgroup: comp.sys.atari.st
Date: 1989-12-23 00:25:56 UTC
From: hans@duttnph.tudelft.nl
Message-ID: <1055@dutrun.UUCP>
Source record: 245367

I think I'll need help on this one...
I recently upgraded my 1040 stf to 2.5 Mb using a kit by Weide
(although this is not a hardware problem). I found that one of
the programs I use intensively (turbo c linker) won't make full
use of the extra memory. The reason is the following:

This linker uses gemdos call 0x48 (Malloc) at least twice for
each file read. It appears that this call can only be issued
some 300 times, after which it fails, regardless of the amount
of free memory. This problem does not occur on a Mega ST !
Maybe it is only present in early gemdos versions ? (I bought
the 1040stf in March, 1987).

Right now, my workaround is to link from the desktop, without
ramdisk, turbodos, etc. I'm cooperating in a large project,
so I really could use a solution. Can anybody help me ?

Anyway, merry Chistmas everybody !

Hans

4547. Re: GEnie uplink is shut down..

Newsgroup: comp.sys.atari.st
Date: 1989-12-23 02:31:08 UTC
From: karl@giza.cis.ohio-state.edu
Message-ID: <KARL.89Dec22213108@giza.cis.ohio-state.edu>
Source record: 245368

logajan@ns.network.com writes:
You shouldn't let people brow beat you. Doing the right
thing does not always win you popularity contests.

Some of us would contend that Mr Small is doing precisely the right thing by shutting it down until it fits into the overall environment properly, both technically and politically. His initial implement-ation fit under neither consideration, and he now understands why.

Sometimes you have
to be a moral/ethical leader rather than a follower. This selfish group of USENET whiners is in desperate need of a model to emulate. You have the credibility to be that model.

I don't whine for anybody, Mr Logajan, nor am I in need of a moral or ethical role model. Name-calling accomplishes startlingly little.

Further, with as much respect as I can muster for Mr Small, he does not (yet) have the credibility for such things. He said himself that his implementation of things was not exactly up to par, and that he doesn't even know how such matters as email addressing are managed. His suggestions for how to implement an email gateway are, to be blunt, naive. What he requires is experience; that's all. If he re-does the link correctly, he'll get that experience. And then he'll have the credibility, and will have earned the respect of those who are concerned about the care with which such things are implemented.

No one has answered my question
about why telephone companies, computer companines, modem companies and software companies can all make money off USENET sites and GEnie can't.

You appear not to have been reading very closely. Quite a few of us have agreed quite readily that there is no reason GEnie shouldn't make a profit, given especially precedents in the form of Portal and others. Many of us disagreed only with the imbalance of the link, not its existence or the profit to be made from it.

I should be offended by your whimping out and leaving the GEnie user in the information poor house.

Might it occur to you that he may face somewhat more disagreeable users on the GEnie side, and that turning the link off is quite the opposite of "wimping out?" That he will now have to face them to say, "I had to turn it off because it needs to be redesigned properly?" I daresay he's got quite a bit of work ahead of himself; he's not wimping out in the least.

Your predilection toward name-calling completely eradicates any
argument you might have had.

--Karl

Thanks to all those who responded to my request
for information leading to wordlists.

Both Austin Code Works of Austin Texas and
Moby Words by Illumind of Monterey, CA.
were suggested with about equal enthusisam.

Given the lists from each of the companies
run about the same price, I opted for Illumind's
MOBY WORDS.. a 530,000 word list.. or about
twice as large as the one from Austin Code Works. .

Other products I'd like to buy in the future
include a phonetic listing and a parts of
speech library... All offered by Illumind.

The disks arrived in MS-DOS 720k format at my request
since i have a 1040ST... all i had to do was load
them onto my hard drive and run the files through
compress -d .. and there they were.... all 6.5 MBytes!

Thanks for pointing me in the right direction.

Source record: 245376

In article <15097@well.UUCP> dsmall@well.UUCP (David Small) writes:
| It's time to announce that there is now a working uplink
| from USENET to GEnie.
| ... The link is one way. GEnie makes its living selling information
| bases to the public, and doesn't want them downloaded and distributed freely.

It sounds to me like you could be on the verge of making an
important contribution to expanding this news group.

However, I would prefer to have GEnie allow two-way exchanges.
Perhaps if the GEnie people see that they can benefit from the
inclusion of the mesages, they will reciprocate and allow their
users to respond to this group as well.

I know that my contributions are small, but (in my humble opinion),
I think they are positive. Somehow it rankles to think that someone
else is taking my work, freely given, and translating it into a profit.
Moreover, they are imposing their own form of restriction by imposing
an "anthology copyright" which some folks interpret (incorrectly, I
think) as restricting them from passing it on.

Well, the GEnie-Usenet link is down. So much for all the doom-and-gloom-sayers in news.misc who figured that Usenet is too disorganized to accomplish anything. I'd say we were pretty successful (this time).

Some of you might be interested in the events that led me to post about Dave Small's idea in such a strongly-worded way. Also, it is my only chance to ``talk'' to Dave directly since he's not answering his mail (or is it just my mail :-) No surprise there.

I had known about the Usenet-GEnie link for several days before it was actually announced. When I was first told it existed (not many details were given) and I thought the link was a great idea. It presented another place to send news. After all, isn't the purpose of Usenet to be a free-flow of information, spreading as much information, around to as many sites, as possible?

What I didn't know then was that the Usenet news being placed on GEnie was being covered by their copyright (or at least the GEnie people figured the news was now copyrighted). I discovered this fact the day of Dave's ``the link is up'' posting. In a discussion about a friend trying to obtain several of my Usenet postings from the Usenet-uplink area of GEnie, GEnie customer service people threatened to ``sue'' any site found posting news that GEnie had received from Usenet *after* GEnie had received it ('cause the Usenet news now ``belonged'' to GEnie).

Before all you amateur copyright lawyers send follow-up flames, let me assure you that I realize the ridiculousness and unenforceabililty of this situation. GEnie *can't* copyright something that's already in the public domain. (And I probably got stuck talking to a tired, over-zealous GEnie representative, rather than an ``informed'' person.) But, the confusion surrounding this situation on GEnie's part was enough to get me worried.

Next I received some reliable information that Dave was on the verge of licensing the ``link technology'' to GEnie. If we didn't act very fast to convince Dave to rethink the link, it wouldn't matter if *his* atari newsgroup-GEnie link were shut down, 'cause GEnie would be busy draining (and copyrighting) the rest of Usenet. (And Dave, Mark Booth did NOT give me this information, so you can start talking to him again.)

Next, Dave's ``the link is up'' posting carried the tone of `the link is carved in stone, the only thing that I'll change is whether individual's postings are removed'. After careful consideration of all the events, I was convinced me that I had to spurred me to strike in the quickest, hardest manner I could.

I believed I didn't have much time to waste with gentle, ``let's think about this guys'' letters. Sorry my strongly worded posting irritated Dave, but it had the desired effect very quickly: mobilize as many people as possible to convince Dave to re-think the link. While I knew that many of you would post loud, angry responses, I knew that many more would write quiet, well-reasoned responses (showing *both* sides of the argument) in answer to my posting. I believe my ``inciteful'' posting put many, many more reasoned responses in Dave's mailbox than if I had written an easily-ignored, calmly-worded appeal to the net. I wanted to spur as many people to respond as possible, and I think I was successful.

That's not to say I was just in this ``battle'' to raise the cry and then leave. No sir. I was prepared for the long haul. Dave actually surprised me when he withdrew the link so suddenly after only a few days of protest. His first posting led me to believe that the link would be here for a long time no matter what.

So now I don't have to write to the management of GEnie, and I don't have to organize petitions, and I don't have to appeal to sites feeding GEnie to stop. There was even a movement to change news sending software so that it attached ``copylefts'' to *whole batches* of news, thus preventing GEnie from using many, many postings.

Richard Stallman and the Free Software Foundation must be commended for coming up with, and organizing the execution of, that last idea. I'd also like to thank Richard for placing the FSF's lawyers at my disposal. I'm very happy I didn't need to use them.

I'd like to thank Dave for giving the net the best Christmas present we could ever have wanted: peace for the present and hope for the future.

I'd like to go on record as saying I'm NOT against sites that make a profit from Usenet, nor do I have many problems with read-only sites. I do, however, have serious problems with any site that tries to copyright my (or anyone's) postings and prevent the dissemination of information.

I'd like to work with Dave to make the GEnie-Usenet link viable and useful (for both sides). If Dave declines my offer (and I expect he will :-) then I hope he at least posts his link ideas for the net for discussion *before* implementation. It would be

even better if he accepted the help and support of the many, many knowledgeable people who volunteered it this week.

Well, that's all I have to say on the topic. The rest of you can continue this discussion (as I know you will). Don't let it degenerate into too much name-calling. :-)

Merry Christmas and Happy New Year to everyone (even you, Dave :-)

I think the reason is just simple economics from Atari's point
of view. The ST has had a much better selling rate in the European
market; therefore, the demand for additional hardware and software is
higher. Logically, Atari is going to spend most of its advertising
and distrubution dollars where the demand is. This is unfortunate for
US ST owners, but the company needs to do what it can to survive.

As Steven Grimm says, my posting about the STE was a concentrate of a German article, meanwhile I HAVE signed something as an official developer. What bothers me there is: Alan Pratt talked about the risk of making errors when I reveal secrets. As Atari hasn't published technical material for non-developers does that mean that all technical books about Atari ST are either illegal, or that they are produced by hackers who have disassembled programs??? If the latter, isn't THERE a chance of errors popping up that could have been avoided with some help from Atari Corp.?

Hehehehehehe....

On a more serious note. If anyone is aware of comp.unix.wizards and their respective net.worlds, they have stated for quite sometime that they would like to get entirely rid of comp.other.worlds entirely for the sake of savings of groups of bandwidth & so everyone can "really" get things done. Usenet in itself in "original conception" was to be a place to extend everyone's unixsex abilitys. And, for quite sometime they argued back & fro about trying to ax all other non-pertenant newsgroups alltogether. Sort of a comp.apocalypse of sorts. (hehehe).

Sources to LHARC on the IBM are readily available on any half-inept IBM
BBS. I have heard mention that the ST version is incompatible. If this is
the case, someone should port the PC source instead of creating confusions
between the two (the MAC has it too I think). I have glazed over the sources
on several occasions (and to be honest, the "idea" itself of
Lempel->Ziv->Huffman coding is a natural, so obvious its funny it wasnt
discovered quite some years back) and do believe it could be sped up, and
could get better compression yet (although not "drastic") by using a
run-length-encode after the huffman squeeze. Since it's just bufferin'
a byte of output bits, then writing the byte out, it'd be nothin' to buffer
"more" bits before the output, and RLE the bits. MANY storage devices
(that have any sorta brains about em') do exactly that, in hardware. Since
LHARC is already slow (due to it's iterative nature and semi-efficient trees)
whats a few seconds more?. And as I stated, I do beleive LHARC in itself can
be sped up. While using arrays for tree's is fast on access times, it is not
in insertions and deletions. I beleive a "pre-formed" dynamic tree ala'
pointers couls speed it up (and some other tiny items).

From: dsmall@well.UUCP
Message-ID: <15199@well.UUCP>
Source record: 245384

I'm writing this (brief) note to help bring the discussion to the close.
The USENET-> GEnie link is down and will stay down until many, many things
are cleared up, like 2-way access, email, etc. I've posted a fuller
explanation
of my intent and what happened .. which I can sum up with, *sigh* ... in the
"link is down" note.

I wanted to do this to hopefully cap the discussion; it's about
something that no longer exists. Ever since I got the first batch of email
teling me of the problems with the idea, I shut the thing down, and it's
stayed off since, okay?

Now can we please get back to a discussion of Chaos Strikes Back?

The base note, SIGH!, discusses Genie's anthology-copyright on USENET notes.

Diane, I would appreciate it if you would stop discussing a HYPOTHETICAL thing -- GEnie attempting to place an anthology copyright on USENET notes -- in such "guilty until proven innocent" tones.

The entire USENET<-> Genie link is *experimental*. If the management there was not VERY flexible and open to new ideas, it wouldn't be there at all. I fully expect to be able to drop them a line after they get back from holidays, and come back to the newsgroup here with the assurance they will do no such thing. I'll even get 'em to sign it in blood.

Look, they WANT this to work out! Not to leech profits, not for base motives, but to provide their users with services. Anyone who thinks that at $6/hr GEnie is ripping people off has never run a mainframe plus nationwide telephone access service -- it's cheap. I have found GEnie willing to support EXTREMELY experimental and new ideas in RoundTables, that won't make money (if at all) for years.

They're in trying, Diane, and you're in here poisoning the water, telling us what Dark and Evil things await.

Diane, if they try *ONCE* to put an anthology copyright on USNET notes, I'll have nothing more to do with them. There, you can hold me to it.

Now would you PLEASE let there be a little "innocent until proven guilty" here in this link discussion? I know USENET has been burned by CIS and BIX (I know *now*, not 4 days ago); but give GEnie a chance -- and me, too, huh?

I'm very tired of paranoid views of large companies always being profit-mongering evil entities, out to stamp out anything good in the world. Such stuff belongs in tired propaganda.

I strongly support Moreau's call for a Unix version. I run a BBS on a
Unix system with archives on a PC with a huge drive. Both zoo and arc
formats are supported by all three OS's, but LHARC is creating lots of
problems for me. It should not be used for a group like this unless it
can run on all machines through which the code is likely to pass.

4566. awk port for ST

Newsgroup: comp.sys.atari.st
Date: 1989-12-24 17:53:01 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5152@blake.acs.washington.edu>
Source record: 245390

```
I grabbed awk.ttp from the net many months back..
and have used it successfully for string matching
and manipulation...

Last night i wrote a couple of quick dot.g scripts
in gulam using awk to produce some quick reports
for my student records which included integer addition.
The scripts are very straight forward with a simple loop.
I am not sure if the problem is in the conditional or what.

Here are the two awk scripts:

due.awk
-------

BEGIN { FS = "\t"
printf("%-15s %4s \n\n", "STUDENT", "DUE")
}
{ printf("%-15s %4d \n", $1, $2)
total = total + $2
}
END { printf("\n-%15s %4d \n", "TOTAL DUE" , total) }

owe.awk
-------

BEGIN { FS = "\t"
printf("%-15s %4s \n\n", "STUDENT", "OWED") }
{
if ( $2 > $3 ) {
printf("%-15s %4d\n", $1, $2 - $3 )
total = total + ($2 - $3)
}
}
END { printf("\n%-15s %4d \n", "TOTAL DUE", total) }

If I pass a file such as this to the awk scripts:

Abdul 125 0 15 60 weird
Nadily 100 0 15 72 gorgeous
Mark 125 0 15 12 no comment
....
etc

Where field $2 is the amount DUE and $3 is amount PAID...
```

I should get the same results with both due.awk and owe.awk.
On the ST, owe.awk yields a total that is greater by
a value equal to the first line $2 field. I inserted
print statements to find the error.. I thought i was
not understanding the way awk searches for patterns on
a line by line basis... but when i uploaded it to BSD..
it worked straight forward and gave correct results.

IS there a problem(s) with AWK.TTP , or am i misunderstanding
something in my code? I'd much rather be able to write
short dot.g scripts for quick things like this than have
to compile C code or open a spread sheet etc..

Thanks ..

-kevin

4567. Public Apology to Dave Small

Newsgroup: comp.sys.atari.st
Date: 1989-12-24 18:12:59 UTC
From: canada@crash.cts.com
Message-ID: <980@crash.cts.com>

Apology to Dave Small

It has come to my attention that some people have associated my remarks about the GEnie-Usenet link with the character of Dave Small. This was never my intention. The GEnie-Usenet link and Dave Small and his company, Gadgets By Small, are completely different entities and should not be lumped together. What you may think of the link definitely should not change your opinion of Dave or Gadgets. I feel that Dave Small and Gadgets By Small are invaluable to the Atari and Usenet communities and are very, very generous.

Dave gives away a great deal of information, goods, and services to the Atari and Usenet communities and Dave should be valued and praised for his commitments and achievements. Dave has contributed greatly to the Atari community in the true hacker spirit, and it is unfortunate that GEnie's handling of the link cast the shadow of doubt on this. I am now informed that Dave was not aware that any representative of GEnie would try to copyright Usenet material. If he had been aware, he would have never implemented the link.

I regret the personal distress that my posting (and the various responses it generated) has caused Dave Small. I ask all of you who took the time to write Dave to oppose the link, now write him showing your support and appreciation of Dave, personally, and of Gadgets.

Message-ID: <25340@cup.portal.com>
Source record: 245392

There is an excellent DA called cardfile available on GEnie, and probably other systems including BBSes. It has only one defect which is that it doesn't allow space for the new (long) Zip codes. It has a separate field for first name, last name, middle initial, title, company, address, home phone work phone and a couple of comments fields. It allows for filtering on the basis of any string in any field on the basis of all records that have any of the chosen field strings or those that match all of them. If you don't have access to it, and or others would like it I'll UUENCODE and post it here.

>Kevin Clendenien states that Apple computers (he
>also mentioned another brand) need Apple peripherals and that they cost much
>more than Atari ST peripherals. I don't know if you've looked at the Apple
>side of things lately, but this just isn't true.

Yes it is....

>First of all, Apple computers (specifically Mac's) don't need to use Apple
>peripherals. Maybe you're not aware that there are more third party peripheral
>suppliers for Macs than for ST. Just look in any Mac specific magazine
>and you'll be surprised to find how many brands of hard disks (internal and
>external), back-up tape drives, graphics display cards and monitors and
>floppy drives are available for the Mac. There are also alternatives to
>Apple Laserwriter and Imagewriter.

Find a 3rd party Apple floppy drive that is totally compatible with the
Apple drives, and I'll show you a snowball that survived a trip through
hell....

Sure there are alternatives to the Imagewriter, but the I-writer is the
most used. Ergo, it is the most supported by software.

>Second point. Apple peripherals from third party suppliers are priced
>at least the same as Atari ST peripherals. In some cases, they are even
>cheaper on the Mac than on the ST. For example, look at hard drive prices.

Let us not forget that the Mac has the SCSI board ST users need built
in. For the IIgs and other Apples, you spend $120 for this board.

>Quantum has an ad for a 20 Meg hard disk for $499 (Atari Explorer). You could
>buy a larger drive for the Mac for the same price (Cutting Edge: 20 Meg - $439.
>30 Meg - $499). External floppy drive for the ST costs $149 (this is the
>cheapest I've seen). An equivalent Mac floppy drive costs the same. Of course
>memory is also cheaper on the Mac.

Tell that to my friend who bought a new 3.5 inch Apple drive. The
retail price is $400! I spent about $100 building one for myself. As
for hard disks, I built one for my father's 1040...a 20 meg Seagate,
Adaptek, and ICD host adapter for $350. Beat that on a Mac.

>It seems to me that the only thing cheaper on the Atari ST is the computer
>itself. I have a bare 1040STF at home and a new Mac IIci with loads of stuff
>at work.

No kidding. Atari planned it to be less expensive.

In my little bits of hardware hacking on the ST, I've found it to be a
VERY versatile computer. I can add IBM drives, generic power supplies
(as this Lambda 12A supply shows....my drives are connected to it too),
and joe-schmo printers and modems. I have STANDARD ports for these.
The Mac has those dopey 8-pin Apple plugs. I can even open up my ST.
That damn Mac has those recessed Torx screws. PLUS, I can have color
AND monochrome on my machine.

Date: 1989-12-25 04:41:40 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <25347@cup.portal.com>
Source record: 245394

Marcelino Bernardo asked about a "bug" that had been reported in "Chaos Strikes Back", the sequel to Dungeon Master...

I'd meant to reply to the original message which reported this "bug", but unfortunately didn't have time, at the time...

The "bug" involved the apparent inability to use Fireballs at a certain location in the Dungeon, specifically at the top of a staircase, while facing hordes of nasty blue "Ant-Men"...

Definately NOT a bug... what's happening is that the first "square" at the top of the stairs contains a "spinner" which only affects thrown magic, like fireballs and poison missiles. If you hurl a MON fireball, you'll be able to hear it explode somewhere off to the left where it's reflected.

This forces you to use your weapons against the first group of four Ant-Men, then IMMEDIATELY move forward onto that space. (If you don't move quickly, the next group of Ant-Men will occupy the space, and you're stuck in the same situation as before) THEN you can use your magical missile weapons with their normal terrible effect...

There are many such "invisible" spinners in Chaos Strikes Back... just anothe example of the added challenge the sequel brings to the game...!

Sorry, this isn't "pick on Dan Scott" week, really... but...

>in article <25126@cup.portal.com>, Bob_BobR_Retelle@cup.portal.com says:
>
>> Consider that the *cheapest* IBM clone board comes *socketed* for easy mem
>> expansion to the maximum RAM the system can utilize...

>However, the *cheapest* IBM clone still only knows about 640K of memory
>max (8086 based here). Without an *EXPENSIVE* memory board in one of the
>card slots and some driver software 640K is all you'll ever get to use.

Missed the point again, Dan...

The point is, even a $59 IBM clone board can afford to provide you with the
sockets to add RAM up to *its* maximum capacity, while Atari Corp is too
cheap to install the $1.00 worth of sockets to give Atari owners expandabilit
to the maximum RAM capacity of their systems.

Maybe that's changing, now that we're seeing the promise of the use of
SIMMs for expansion... if it happens, that could be one of the best things
Atari has done in five years...

Greg Lindahl says, about Atari's making two different Mega PC boards..

>Maybe it doesn't cost them more? Do you know anything about manufacturing?
>I sure don't...

About PC board manufacturing..? Yes, I do know about PC board manufacturing.

> ... And so I try to avoid showing my ignorance in public by
>bashing Atari on topics that I don't know anything about.

Oh well, guess we won't be hearing from Greg anymore on this topic.. how about anyone else who's been involved in designing PC boards, or etching them, or the processes of automated drilling and parts insertion.. can anyone think of a reason why it would be more cost effective to take ONE part which serves an identical purpose in TWO products, and redesign it so it only works in one of them, thus requiring TWO separate parts, lower production volumes on each, and separate inventories..?

Sigh... Greg Lindahl says, about Atari forcing customers into deadend machines..

>You are obviously wrong on 2 counts:

>1) Then Atari would have not put SIMMs onto the STE

Wake up, Greg... Atari made the changes to the Mega ST2, to enforce their policy of non-expandability something like *TWO YEARS* ago..

Putting SIMMs into STEs has nothing to do with a business decision made that long ago (and incidentally won't help Mega owners at all).

>Leave your silly conspiracy theories at home.

Did I call it a "conspiracy"..? I call it "business"... Atari's way of enforcing their brand of short-term greed on their customer base. Their stated policy on memory upgrading makes it clear why they did it.

Again, maybe the use of SIMMs in *new* products heralds a new era in Atari/customer relations... we'll see...

Message-ID: <25354@cup.portal.com>
Source record: 245400

(Sorry, Dave.. you knew I'd have to have something to say, right...?)

My feelings about a one-way GEnie link to UseNet..?

UseNet is UseNet, and GEnie is GEnie... one has a reputation for being
a technically oriented, well informed source of information, and the other
has let its reputation slide to being a "K-Mart" for cheap downloads.

Even if it was CIS or BIX who was involved, everyone here has to realize that
a commercial venture will now be making money from every article, message
and comment you may post here, without giving anything in return.

Of course the GEnie management has been receptive..! While Dave may not
make any money from the deal, remember that $5.40 of every hours reading
of your messages goes directly into the pockets of people like Neil Harris
and Bill Louden (gaak). And naturally, under their "compilation copyright,"
they aren't going to allow anything to flow the other way, even if it wasn't
for the load that would impose on the network.

If you want UseNet style information, come to UseNet... if you want
<giggle> <tee hee>, go to GEnie...

BobR

(sorry... no offense intended toward K-Mart...)

Rob DeMillo mentions:
>In addition, there are 10's of 1000's of people who can *not* get access
>to USEnet, would you deny them our info/rumors/conversations/etc?

In actual fact, I'm accessing UseNet right now through Portal, a *two way*
access point into UseNet for anyone who doesn't have access through
a University or company.

For a *flat rate* fee of $10 a month, plus about $1 an hour for PC Pursuit,
I can have two way access to UseNet...

So it's not true that GEnie subscribers can't get UseNet info...

4579. Re: Copyrights and Commercial Networks and Usenet

Newsgroup: comp.sys.atari.st
Date: 1989-12-25 08:26:35 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <25356@cup.portal.com>
Source record: 245253

Sigh... I was hoping someone else would tackle this one...

The information provided by Dianne Barlow Close' cooespondent, Richard Kelsch was very good, and goes right to the heart of the matter..

Unfortunately, it was interpreted slightly wrongly..

First of all, the correct term is "Compilation Copyright".

This is the way you protect a new collection of existing works, such as a collection of stories, sheet music, artwork, whatever... including "Newsnet" messages.

The works within the compilation may already be covered by copyright, or they may be in the Public Domain. The Compilation Copyright applies only to the collection, not to the individual works.

Thus, while Beethoven's music is in the Public Domain, you could NOT copy the sheet music that appears in a newly printed book which is covered by a Compilation Copyright.

Every time you sign onto GEnie (or CompuServe or Delphi or any of the other commercial information services), you see a (C)opyright notice. You may never notice it, or pay any attention to it, but what it's saying is that everything that appears on your screen from that point on until you disconnect, belongs to GEnie and may NOT be copied. That includes Public Domain programs that have been uploaded to their databases, messages from other users, transcripts of conferences, *everything*.

Now, here's what most people don't understand... GEnie is NOT saying that they own a copyright on, say, Charles F. Johnson's PINHEAD program, which he released as shareware.. they ARE saying that they own the COPY that appears on GEnie, under their "Compilation Copyright" and that you may NOT copy it and pass it on anywhere else. If you get a copy from Charles, fine.. you can upload it anywhere you please, but not the copy you get from GEnie.

Pretty silly, right..? How can they tell the difference between the two? Obviously they can't, and in all practicality the compilation copyright is practically unenforcable. CompuServe found that out when they threatened some BBS operators who were stupid enough to publicize that they had the "latest from CompuServe" in their downloads. Where the GEnie copyrig would be enforcable would be material which obviously originated on the service in the first place.

So, yes, GEnie is claiming a copyright over your UseNet messages which appear on GEnie, and no, it has no practical effect on anything.

A side note, Dave Small would be bearing the brunt of ANY legal actions. Because of the fine print in their contracts, GEnie practically CANNOT be sued for anything. The individual little guys have to pay it all.

BobR

4580. Re: GEnie uplink is shut down..

Oh well.. my ST was down for surgery for a few days, and I see I've come in late, so everyone ignore my previous few postings on the subject (I'm sure you will)...

What I'm surprised that no one has suggested throughout all of this is that GEnie just bite the bullet and become a UseNet site. Portal has been mentioned several times in the discussion, but Portal is a paying member of UseNet and has full two-way access. The way GEnie was doing it was by getting in "the backdoor", for free.

There would be no "flood" of GEnie material, as only messages specifically posted to UseNet (as with Portal) would appear on the newsgroups.

However, it would take money to set up as a UseNet site, and it would take software to handle the newsgroup feeds. That would take a bit more selling than just offering them something for free.

4581. Usenet messages on CIS, GEnie

Newsgroup: comp.sys.atari.st
Date: 1989-12-25 09:46:29 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <2327@sactoh0.UUCP>
Source record: 245255
Cross-posted to: comp.sys.atari.st,rec.arts.anime

Hmm. Alot of traffic on comp.sys.atari.st screaming, pleading, apologizing, etc, about the posting of Usenet articles on GEnie.

From what I have read, a majority of the posters disliked the idea very strongly, that Usenet messages appear on a pay service, that is, a one-way link- Usenet on GEnie, but nothing from GEnie to Usenet.

I understand that someone in rec.arts.anime compiles messages (edited? unknown.) and uploads it to CompuServe's Japanimation forum's downloads section, as "Usenet Digests". Now, as I understand it, noone there has said anything about it. So the users in r.a.a. apparently does't mind that their messages have to be "paid for" and downloaded from CIS.

When I was on CIS, I used to see the files, but due to the size of them (usually around 32k) I never dloaded them. (read: $$$) But when I found out there was a local public access to Usenet, I switched and use this system exclusively.

Now the users in r.a.a. apparently feel that the availability of anime information should be passed around, and it is my impression that c.s.a.st users do not want Usenet appearing on any pay service.

Hello World.

A question about Chaos Strikes Back. I was under the impression that you were to get a piece of that metal (corbite, was that how it was spelled?) from each section of the dungeon (figher, ninja, wizard, priest). Now, I am in the fighter level and I think I've covered everthing except for this one locked door that the hints insist is opened by this opal key. I can find no key hole. NONE! I am going nutso trying to figure it out. To give you a point of reference, this is just after that room with all those little guys in it that look like dwarves or something out of Star Wars.

As a side note, partially concerning this Genie thing, I am sure while there are a lot of people complaining about uplink, we all realize how valuable David Small is to the ST community. Three Cheers.

>is, a one-way link- Usenet on GEnie, but nothing from GEnie to
>Usenet.

This is a long standing problem and we've been wrestling with
it on BIX. If I can blow our horn a bit, at least on BIX we *care*
about how people feel about moving messages from Usenet to BIX.
I've shared messages from 'rec.arts.anime' with some specific people
on BIX, but I've only made general postings of things on special
occasions and usually with specific approval by authors. You people
must realize that there are specific *commercial* Usenet nodes
around, don't you? Actually, I've long felt that it was improper to
post *anything* on the Net which was not FULLY PUBLIC DOMAIN. This
has nothing to do with legality, but simply a recognition that the
Net exists because the NODES PAY FOR IT. Since every node contributes
effectively to everyone else on the Net, how can you justify stopping
anyone on the net from making the fullest possible usage of anything
that you post to it? If you've been following 'comp.os.os9' you'll
know that *every* program I have posted to Usenet which was my own
work over the years has been declared fully public domain. Nor do
I restrict any other postings I make which are my own work (not that
most people care about whether I declare my opinion messages as
public domain or not :-).

Despite this, we have specific permission on BIX to carry
the 'risks' stuff, thanks to the Net moderator. Furthermore, we
are acting as a network node for the Citadel network under the efforts
of Jefferson Software.

So that's my stand: 1. I have not been porting to BIX from Usenet
en masse for the BIX public, 2. I do not feel people are right to
complain about the practice of using these messages on the commercial
systems.

But this leaves me with a problem: If people are doing this on
Compuserve and Genie, then BIX may be at a competitive disadvantge
because I've been the "good guy". So maybe I should change my practice
and start posting a digest of 'rec.arts.anime' on BIX? I don't know.
How do you people feel about this?

Cheers! -- Jim O.

I'm still working my way through the original dungeon and have a request for help. I am on level 7, just past the place where you find the Vorpal Blade. I am in a locked corridor with 3 doors. One of them I opened with magic, but a transporter keeps me from entering it. I have been told that if my players drop enough equipment, they can run fast enough to avoid the transporter. I have not been able to do this. I have my guys down to about 9 lbs of stuff each, and they still can't make it. The real bad news is I am experiencing a bug that prevents me from dropping any more equipment. When I drop another piece, that game hangs. Is this a documented bug?

I do have several save disks, back further in the game. Is their a limit to the number of objects in a room? Can I drop stuff further back and then retrieve it later? Am I f**ked?

Any help gladly received!!

> GEnie just bite the bullet and become a UseNet site.

Even the most vocally antiGEnieans have suggested precisely that.

> Portal has been
> mentioned several times in the discussion, but Portal is a paying member
> of UseNet and has full two-way access. The way GEnie was doing it was
> by getting in "the backdoor", for free.

Paying member of Usenet? Paying whom? Not me. I may forget my phone number
sometimes, but I wouldn't forget a check from Portal. No siree. It doesn't
work that way.

Usenet is NOT a physical network. Usenet is NOT a legal entity. Usenet
does NOT have a corporate existence.

To be on the network, you don't have to pass muster with any sort of
screening committee. There isn't one.

You don't buy a license. You don't have to get a node number. Usenet is
not the Internet, nor is it Fidonet, nor is it run by the government or by
universities or even corporations. It's just something that happens, by
consensus: Site A agrees to exchange messages with site B. Site B agrees
to exchange messages with sites C, D and E. If Site A doesn't like Site E
appearing on the network, it can decline to participate in the network. It
has no authority to forbid Site E from joining.

> There would be no "flood" of GEnie material, as only messages specifically
> posted to UseNet (as with Portal) would appear on the newsgroups.

That's up to the site (GEnie).

> However, it would take money to set up as a UseNet site, and it would take
> software to handle the newsgroup feeds. That would take a bit more selling
> than just offering them something for free.

Usenet software is free. Usenet news standards are quite simple and
well-documented. If I can figure it out, I'm sure it's intelligible to
General Electric, one of the world's largest industrial corporations, and
its data-networking subsidiary (of which GEnie is a minor component).

Everybody, PLEASE, before you get all worked up in a dither and start flapping your arms, take the time to bone up on the network. Read the postings in news.announce.newusers. Go to the library and read Harry Henderson's excellent article on Usenet in the Waite Group's "Tricks of the Unix Masters." Read news.misc and news.admin for awhile. Do your homework. Keep the flames in the fireplace.

Is the Net designed as a means of information exchange? If so then so be it. Surely a one-way link is better than no link at all. I spend well over 75% of my Net time passing information between the other services I am on and the Net and its not fun. The fault lies not with GEnie and other pay services, but rather the Net itself. If the Net is truely set up to facilitate information exchange then its impossible for it to be 'raped' for information sinec that is its only reason for existance right?

Peter Szymonik

The distinction between the Net and GEnie and other pay services goes far beyond the price aspect. Face it, there are things which you can get from an on-line service which the Net does not provide (and never will due to its structure.) I don't mean to knock the Net, just to point out that it is very different from other services. I can get all the free news I want from radio and television, but there is a reason why I BUY magazines like The Economist. Surely you would agree that all information is NOT free, you get what you pay for.

Just to echo Dave's words, GEnie has been *exteremely* receptive to new ideas and newsgroups on their system. Two years ago I and a few other veteran wargamers had a vision of creating a large newsgroup of board wargamers and starting some Play-By-E-Mail games. GEnie was very helpful in getting us starting and giving us a chance to prove that the people were out there to support our idea. Two years later we have a thriving Diplomacy and Wargaming Category with industry support from ever major game manufacturer and have hundred of regular readers - I know of NO other service that would allowed us this opportunity and taken this chance.

Source record: 245263
Cross-posted to: comp.sys.atari.st,rec.arts.anime

mfolivo@sactoh0.UUCP (Mark F. Newton) writes in article <2327@sactoh0.UUCP>:

| Hmm. Alot of traffic on comp.sys.atari.st screaming, pleading,
| apologizing, etc, about the posting of Usenet articles on GEnie.
|
| From what I have read, a majority of the posters disliked the idea
| very strongly, that Usenet messages appear on a pay service, that
| is, a one-way link- Usenet on GEnie, but nothing from GEnie to
| Usenet.

My own understanding of the whole matter (this from reading about it in the news. groups) was that David Small, of Gadgets by Small (which produces among other things a Mac emulator for the Atari ST) had implemented a Usenet-Genie link, one-way. That it was one-way irritated some users, but that Genie claimed to have a copyright on the articles once they had received them was the final straw.

To put this in concrete terms, if my site received this message I'm replying to after Genie got their hands on it, I would be (by Genie's claim) breaking copyright law. Posting a public reply with attribution (such as this message is doing) from another message could also get me in trouble with the Genie copyright claim.

Obviously, this was an absurd claim, but it was the official position that Genie was taking. Therefore, a few people mobilized to have Dave Small shut down that link, so that they could discuss out all the ramifications of the link first.

| I understand that someone in rec.arts.anime compiles messages
| (edited? unknown.) and uploads it to CompuServe's Japanimation
| forum's downloads section, as "Usenet Digests". Now, as I
| understand it, noone there has said anything about it. So the users
| in r.a.a. apparently does't mind that their messages have to be
| "paid for" and downloaded from CIS.

I've seen this as well, but I'm not sure what to make of it. Compuserve is indeed a pay service, and technically they're charging people money on files part of which are culled from rec.arts.anime. However, they're not attempting to claim it as their own under copyright, as Genie was doing. People that download it are free to redistribute it, as far as I know.

| When I was on CIS, I used to see the files, but due to the size of
| them (usually around 32k) I never dloaded them. (read: $$$) But
| when I found out there was a local public access to Usenet, I
| switched and use this system exclusively.

```
|
| Now the users in r.a.a. apparently feel that the availability of
| anime information should be passed around, and it is my impression
| that c.s.a.st users do not want Usenet appearing on any pay
| service.

Yes, but don't forget, many people have to pay for their Usenet accounts,
so that invalidates that opinion right away. I'm certain that it was the
copyright issue that had people campaigning against the Usenet-Genie link.
As I recall, they were talking about forcibly placing "copylefts" :-) in
the UUCP batching software, which would render many articles useless for
Genie's purposes...

Don't jump to conclusions Paul. This does not seem too likely to me.
I tried that program on a file that was posted a couple of months ago.
It was a disaster.

> I for one use a UNIX system for posting and recieving news
> and binaries. I uudecode, and unarc on the unix system and examine
> the stuff before going through the expense of going home,
> making a ... call to work and download the stuff.

I agree and sympathize with the writer here. I do much the same thing.

However, I would insist that a program be significantly better before
we switch to it. It takes a lot of effort to bring a large body of
users on line to the use of new software. Readers may recall that
I asked about ZOO and whether or not it was really better. I am convinced.
It does offer significant improvement over ARC, and now use both ZOO
(and ARC) on three systems.

Now, I ask, can anyone speak up for LHARC ? Is it really any better
than ARC ? I can testify that it is harder to use! I doubt if
it is better than ZOO. If I am right about this, perhaps we should
just let it lie in peace.

With all the discussion (to me, whining) about how "easy" it is to expand IBM memory as opposed to the Mega, (blah blah blah), I have one thing to say.

Why do you need megabytes upon megabytes of memory, if you use a computer in a home environment? Do you really need 93 Terabytes to do word processing?

I have a Mega 4, and for home purposes, it is sufficient. And even for small business use, 4Mb is certainly enough to drive laser printers.

Do some people really know how much memory 4Mb is? Most small businesses get by with 640k, maybe even 1Mb (which most IBMs only use less than 640k in their programs). I mean, 4000kb is not enough?

About not being able to expand the Mega 2, has someone from Atari responded to my posting about the 2Mb expansion kit from Atari? To reiterate, I once worked at an Atari dealer, and we had a couple of these 2Mb expansion boards that plugged into the expansion bus. Since I had a Mega 4, you couldn't plug it in, but we never sold one to any Mega 2 owners. With all this talk about more memory, is this expansion board still available from Atari?

For home use, and small business use 4Mb is certainly enough. And if you *really* need more capacity, then the TT is for you. (Although you need to go to Europe to get one)

Gee whiz...

All this bashing (will it ever end? Do they have this on
c.s.amiga??)

Let's see, business can change a design anytime they want, due to a
number of reasons, like perhaps a better design, less expensive to
make, etc. So what if Atari uses two separate board designs? Who
care? Why waste our time (and money) crying about the little
things?

SIMMs? Maybe again, Atari has gotten better pricing on memory chips
with SIMMS rather than DRAMS.

WHO CARES??? Why are you crying about why someone uses a
particular type of memory chip? Does it *really, really* matter
that my 4 Megabytes are DRAMS, and an STE uses 1Mb in SIMMs???

Yes, I would like to add the UCSD p-System (or as its current vendor, Pecan Software, prefers to call it the "Power System").

I run it all the time (under NeoDesk), and am in the process of developing GEM libraries for UCSD Pascal.

Last I heard they had even developed a NEW p-machine interpreter for it that will permit access to the entire memory space (not just 64K + codepool as the old one did). But I don't know for sure... I am still using the old one.

I had this problem using MWC. There is a real Malloc() call to get space
for malloc() to distribute. Since there is a real limit on how many
times you can call Malloc, I found that
MWC has a variable that changes the size of the chunk each Malloc() asks
for. I find the free space, divide it by 32, and tell malloc to ask for
that much each time it does a Malloc(). (in MWC the variable is
_aclicksize).

[Let me start by saying that while this reads like a flame of Diane,
that it isn't. It is a flame against a much larger group, not just one
person. Diane's note was just a convienent starting point. --- dlm]

in article <966@crash.cts.com>, canada@crash.cts.com (Diane Barlow
Close) says:
> Next I received some reliable information that Dave was on the
> verge of licensing the ``link technology'' to GEnie. If we
> didn't act very fast to convince Dave to rethink the link, it
> wouldn't matter if *his* atari newsgroup-GEnie link were shut
> down, 'cause GEnie would be busy draining (and copyrighting) the
> rest of Usenet. (And Dave, Mark Booth did NOT give me this
> information, so you can start talking to him again.)

Very interesting. I talk to Dave far more than most people and I
NEVER heard anything about his "licensing the ``link technology''. I
suspect that your "source" wasn't as well informed as he/she thought.

> That's not to say I was just in this ``battle'' to raise the cry
> and then leave. No sir. I was prepared for the long haul. Dave
> actually surprised me when he withdrew the link so suddenly after
> only a few days of protest. His first posting led me to believe
> that the link would be here for a long time no matter what.

Dave withdrew the link since he was SURPRISED that so many
people were against it. Especially since he had said he was working on
it in the past and no one complained. So he went ahead and set up a
simple pass though to GEnie, announces it and suddenly was the target of
lots of attacks. Given that why shouldn't he take the easy way out and
shutdown? Remember he thought he was doing something people would
approve of.

And where in the first posting did he say the link was going to
stay up no matter what? (I believe you are reading what you want to
into his note.)

I happen to think that a Usenet to GEnie link, either one or
two way is a bad idea. Mainly because of the high S/N ratio on the
commercial nets like GEnie (at one time or another I've used all of
them). But if such a link goes up I'm not going to worry about it.
I'm already on several of the commercial nets, having what I say here
also posted there doesn't change things very much.

I am very surprised at how many people treated this. People
are now using this as a way of bragging that they were ready to fight

the battle till the bitter end. And how if it hadn't been for them that Usenet would have been ruined. Almost sounds like they (and there are lots of people in that "they") need the PR in order to join the "net gods".

This all could've been handled, politely, with a few email messages to Dave telling him why he was wrong to setup a one way link to GEnie. He does read and answer his mail. (It does take awhile, his mail/news feed adds at least 1 day, and often 2 days, each directtion.) Instead there was a wild attack with no attempt to try milder measures.

Oh well, maybe it was just time for a good flame war and Dave was just the easiest target.

>public domain or not :-).

As Managing Sysop of the SF & Fantasy Roundtable on GEnie, I had to respond
to the implied remarks above regarding GEnie.

The SFRT has never carried any Usenet material that I did not explicitly
clear with the author or moderator beforehand. I am very respectful of
the personal rights of the Usenet authors. If and when a Usenet gateway to
GEnie is available, the policies I apply to it will depend a great deal on
how the gateway is technically implemented

Quite frankly, I really don't NEED 1E6 new messages coming in over the
net. I've already got more message traffic than I can handle just from
the regular users. A lot of my users would like an EMAIL gateway, and
I'd be all for that.

> But this leaves me with a problem: If people are doing this on
>Compuserve and Genie, then BIX may be at a competitive disadvantge
>because I've been the "good guy". So maybe I should change my practice
>and start posting a digest of 'rec.arts.anime' on BIX? I don't know.
>How do you people feel about this?

Do you really think you're going to get a consensus on this? You could ask "Should I go around killing babies?" on Usenet, and you'd get opinions on every side of the spectrum. Frankly, Usenet is it's own worst enemy, because it is almost impossible to reach consensus of any kind on non-binary decisions.

If you want to port over the message traffic here, it's between you and the users here. For the moment, I've I consider it more effort than it's worth compared to the more interesting projects I'm working on. I MAY contact folks about individual articles of merit, but that's between me and the author, and the rest of the net has no say in the matter.

Can someone tell me the numeric Internet address for panarthea.ebay.sun.com?
I have the address 192.9.203.56 but that doesn't work. I looked in the
NIC database and panarthea.ebay.sun.com is not listed there.

Thanks in advance.

4603. Pagestream 1.8 and the HP Paintjet Color Printer

Newsgroup: comp.sys.atari.st
Date: 1989-12-26 22:09:34 UTC
From: rcd@cbnewsj.ATT.COM
Message-ID: <3032@cbnewsj.ATT.COM>
Source record: 245277

I've been using Pagestream 1.8 with the HP Paintjet printer for a few days now. This combination has opened up a completely new dimension in ST computing for me: high-resolution color desktop publishing.

Pagestream can import all resolutions of Degas and Neochrome files, and print them with their color palettes intact. It can even import IFF format files containing Amiga ILBM/HAM pictures with hundreds of colors, and they come out in their full spectral glory at 90 dpi. At this resolution the Paintjet offers up to 330 colors using a 2 x 2 dot dithering scheme per pixel.

With Pagestream, you can also draw object-oriented drawings, and assign each object a color from the default set (which includes colors like cyan, etc). Although you will not see the full range of these colors on screen (you can map only a couple of them in medium-rez), they will print out correctly and brilliantly on the Paintjet. Thus, creating purple triangles, orange pentagons, and complicated grouped objects in color is a breeze.

Pagestream also has fantastic text capabilities, since it uses outline fonts and comes with a set of serif, sans serif, and artistic fonts. Needless to say, text can be assigned colors as well.

Summary: for the ST, this is one heck of an impressive color DTP system.

P.S. If you would like to see good-quality color printouts of any of your ST files (Degas, Neo or IFF format), send me email (rcd@mtqua.att.com).

I have no affiliation with Softlogik or HP other than as a user of their products.

Rana Dutt PALINDROME: Doc, note I dissent. A fast never

> Subject: Unexpandable megas

> Why do you need megabytes upon megabytes of memory, if you use a
> computer in a home environment? Do you really need 93 Terabytes to
> do word processing?

Gee, I wasn't aware that home use was synonymous with word processing. My 'home computer' does DTP, CAD & half a dozen other fun & serious things. As soon as I can snarf a color monitor you can add image processing and animation to the list. 93 Terabytes doesn't sound too bad.

> I have a Mega 4, and for home purposes, it is sufficient. And even
> for small business use, 4Mb is certainly enough to drive laser
> printers.

Nobody said anything about going beyond 4 megs. I'd like to get there in the first place.

> Do some people really know how much memory 4Mb is? [stuff deleted]
> I mean, 4000kb is not enough?

Hmm. Seems to me that not too long ago 1/2 meg was considered 'wopping'. Could it be that in another 4 years even 4 megs will seem small? You betcha.

> About not being able to expand the Mega 2, has someone from Atari
> responded to my posting about the 2Mb expansion kit from Atari?

> this expansion board still available from Atari?

'Someone from Atari' has responded. It seems that the kit isn't made by Atari but a 3rd party. Details anyone?

> For home use, and small business use 4Mb is certainly enough.

For now perhaps. What happens when huge displays, long animations, digitized sound and multitasking become the norm?

> And if you *really* need more capacity, then the TT is for you.
> (Although you need to go to Europe to get one)

Oh, the old 'buy another computer' upgrade. 8-P Only now we have to go to Europe to get it. I wonder how many Atari owners are that dedicated? Fortunately, I don't think that's the way it's going to turn out (at least

I hope not).

4610. LDW vs ANALYZE

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 06:40:10 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5164@blake.acs.washington.edu>
Source record: 245284

Can anyone provide pros and cons of LDW and ANALYZE?
I bought ANALYZE three years ago when it was $134.00...
I started using it this week... saw it in the stores for
$34.00. The program can save files in 123 format..
and seems to have a fairly good predefined set of
built-in formulas. For my home business puproses,
the program is plenty powerful.. my only complaint is
the SLOW scroll rate .. OUCH! ... Is this typical
of spreadsheets?... is LDW POWER acceptable?
I use RANGE NAMEs in ANALYZE to get me to cells
rather immediately.. however, it would be nice to be able
to scroll 15 cells away and not have enough time to grind
coffee or drink another bottle of wine.

4611. Re: spreadsheets

Newsgroup: comp.sys.atari.st

If you are looking for a godd spreadsheet for Atari:
drop VIP (it's just too slow) and buy LDW Power. It's fast and easy.
Lotus compatible (both commands and format) and very powerful.
It can use GDOS to make very good printouts of sheet and graphics.

Lately there has been much discussion about how to have a character
string constant in a C program. Many C experts have debated on this.

Well, should I presume it is another evidence of the so-called "high
portability of the C programming language" and of its "high time saving
efficiency" ? ;-) ....

It is just another unsecurity of C.

4619. Need help w/5 1/4" drive

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 16:16:29 UTC
From: jensen@cod.NOSC.MIL
Message-ID: <1732@cod.NOSC.MIL>
Source record: 245293

I have been trying to install a 5 1/4" floppy drive on my 1040ST. I think I have done everything that I have seen mentioned in this newsgroup. I removed the termination resistor pack (and replaced it with 1 K-ohm resistors) and replaced the drive select pullup resistor with a 1 K-ohm. I also buffered the drive select and side select lines coming from the sound chip.

The computer now recognizes the external drive at boot-up, and seems to be able to read existing files written on other machines, but does not reliably write or format a disk.

I borrowed a friend's external 3 1/2" disk just to check that the computer signals are there, and it worked just fine with no problems writing or formatting.

Any help in solving this problem would be greatly appreciated.

> Add Mark Williams' CSD (source level debugger) to the list of
> software incompatible with TOS 1.4. It comes up with something like
> "TOS version dated 04061989 unknown" and terminates.
>
I think you mean DB not CSD. (At least my CSD does not do this).

MWC db plays with tos data that was 'private' in tos 1.0.
Afterward, tos 1.1 and on have a formal table of pointers to this info.

Some one at MWC got carried away and coded it roughly as:

```
if(tos1.0) {
there is no table , rough it;
}
else if(tos 1.1)
goto ok;
else if(tos 1.2)
goto ok;
else
goto h..l;
```

Use a binary editer to look for the date string of the releases and patch
the latest one to what tos1.4 uses [hint: change offset 0x1a0d from 22 to 6;
change offset 0x1a0e from 87 to 89]. Then db will work. Sort of.

It corrupts the system clock, and the console and memory are screwed
until you reboot.

Isn't nice when the OFFICIAL developer software is not compatible with 1.4,
AND MWC claims that it is.

4621. Simple (I hope) PageStream 1.8 Question

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 16:32:29 UTC
From: jensen@cod.NOSC.MIL
Message-ID: <1733@cod.NOSC.MIL>
Source record: 245295

I have been unable to reproduce what appears to be a very simple text effect with PageStream 1.8, and would appreciate help in finding out what I am doing incorrectly.

The manual gives an example of a text object which is duplicated numerous times with a small x and y offset to create a 3-dimensional effect. The instructions say to change the attribute of the topmost copy to "outline" so that it will appear white with the other copies forming a shadow.

When I do the above, the outlined copy appears to be "clear" so that the background copies show through, i.e., the effect doesn't work. After several tries it appears that I just don't know how to make an object "opaque white", so that it obscures other objects behind it. I have tried to change the "fill" parameters, but am apparently not putting together the correct combinations. Can someone please straighten me out? (I'm sure it's trivial.)

4622. CORRECTION: TOS 1.4 Incompatibility; Bad Source Archives?

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 17:07:50 UTC
From: steveg@SAIC.COM
Message-ID: <8912271707.AA05281@SAIC.COM>
Source record: 245296

See what you get when you type before you think?

It was the "db" debugger, NOT "csd" that doesn't know
how to deal with TOS 1.4. I just got off the phone with
Mark Williams' Co., and they say they're aware of the problem
and are working on an update. They also said that while csd
runs, some weirdness might occur - no details on what kind of
weirdness.

BTW: I haven't used MWC for a while, and encountered this problem while
trying to compile the source code in the mandlbx1.arc file from the unindexed
directory at erminator (35.1.33.8). It appears to be missing at least one .h
file, and has a few (so far) minor bugs. For example, numerous variables are
defined and never referenced, and I've encountered at least one misspelling
of a variable. Is this the state of most source code archives? Has anyone
already fixed this code? Would anyone be interested in a repost if I manage
to get it working? (It's (yet another) Mandelbrot set plotting program).

Just this past week, I finally got my Mega2 upgraded to 4megs and
TOS 1.4. My mega2 was bought in April of this year and according to
my dealer(who's now out of business *sigh*), was a part of the first
shipment with the kludgy blitter fix and the more IBM compatible internal
drive. My board had all the lines to the empty ram sockets intact. I just
want to say to everyone that there is hope for us Mega2'ers and lets just
check ours first before we get too scared.

I also want to add thanks to Andy Cassino for the ls373 warning, Greg
Lindahl for pointing me to a person who could do the upgrade, KenB
for TOS 1.4 (there are so many little things that make all worth
it) and BobR for all those Dungeon Master hints...

ps. Why does it feel like defeating Lord Chaos was a happier achievement
than getting my diploma???

Regarding board changes. It is probably quite common for manufacturers
to change the physical board
designs in products.

I know (have seen with my own two eyes) that there were at least two
totally different versions (in terms of
layout of chips etc) of 520/1040STf(m) motherboards -- and I've heard of
at least one more version. The
two boards were totally different - RAM and ROM location, CPU location, etc.

I doubt Atari changed the Mega 2 layout to purposely cripple it. That
makes no sense at all. The Mega 2
layout was probably changed to fix something, to make use of different
but functionally same parts, or to
decrease manufacturing costs.

4625. Another Tos 1.4 incompat.

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 19:29:56 UTC
From: mjv@iris.brown.edu
Message-ID: <23735@brunix.UUCP>
Source record: 245299

After getting TOS 1.4 installed into my Mega2, I tried a rather nifty game I've borrowed from a friend called Warlock by InfoGrames and published by ThreeSixty Software. Well it seems to do some illegal reading of joystick and button. The keyboard movement still works so I guess you could still play it(but its not worth.)
Oh well, not a bad game but it won't be missed.

Message-ID: <533@bdt.UUCP>
Source record: 245300

I'm not going to get into the poliical and ethical questions about
the GEnie to Usenet connnection, but I will point out that there is
an (almost) free way for anybody to read *and post* to comp.sys.atari.st
using the Beckemeyer Development BBS at (415) 452-4792. Using
PC Pursuit this is available for a pretty low fee -- I'm sure less
than what it costs to read the messages on GEnie. I don't make
a red cent from it -- nobody does except the phone company and
whatever Comm. service you use. This *costs* me money to run.
It takes up my disk space, my modem, my time, and my CPU. I do
it as a service to my customers and to the ST comunitity -- I also
do it because I *like* to do it. This stuff about indirect profits
because of "good will" is nonsense -- heck I'm not even smart enough
to figure out how to "write it off"!

Anyway all this talk about "no other way to access Usenet" is baloney.
If people really want to access Usenet, there are better ways than on
GEnie, IMHO, of course.

>and would have to agree to keep them informed of what I was using the
>information to develop, so that they could ask me to stop if it
>interfered with their own internal or contracted-out development.

I find this appalling! Please, people, if you've had this experience,
send me mail and I'll direct it to some people here. I never knew that
becoming a developer meant Atari would try to stop you from doing
something! (I can understand them letting you know what they're up
to, to save you duplicating their effort, but not actually telling you
to stop!)

My appalled condition is personal, not corporate. For all I know, this
might be Atari policy. It is *certainly* Atari policy to let the
subsidiaries do whatever they want, but we can make suggestions.

4628. Excerpt of a letter to Dave Small

Newsgroup: comp.sys.atari.st
Date: 1989-12-27 19:52:26 UTC
From: logajan@ns.network.com
Message-ID: <1989Dec27.195226.5401@ns.network.com>
Source record: 245152

Dave,
...
Actually, my public postings -- well I should know better -- but I suppose I would do them again at the same "level" of intensity. I mean, I saw you do something that looked good, and then saw a bunch of people dump on that and then I saw you back down -- too quickly for my tastes. I admit a high level of frustration in seeing progress rolled back -- it is worse psychologically than never having acheived the progress in the first place.

I've been on this net and others with my "individualist" brand of politics, so I get hate mail practially every other day. You have to realize that people tend to overstate their emotions when they write -- that people can accidently sound cold and heartless in their writing, even when that is not their intention. Even those who are intentionally abusive are usually much more so in the written word than in person or even on the phone. Interactive written communication is just not most people's normal mode of interaction, and so they are unskilled in the most difficult aspect of it -- diplomacy.

I certainly fall into that same problem. So my whole point is that you should heavily discount the "fire" in our postings, and try to pick out the ideas (if any) that are sprinkled here and there within and between the abuse. Also a word of warning -- any posting that you make that takes a strong position could be (and probably has been) taken to be more negative and personal than you ever intended. Readers aren't practiced in reading the work of us unskilled writers, either. It is all a vicious cycle unless you restrict yourself to blowing sun-beams.

I must say however, your postings have been models of diplomacy -- it is just that I pick into the hidden or unintended consequences (out of habit from my usual mode of debate) of otherwise innocent looking statements. There are just some people that diplomacy is wasted on, and I happen to be one of them.

All I am trying to say is that you shouldn't take any of my stuff personally, even if it is clear that it can be taken no other way. It is not intended personally, it is intended as an unmerciful examination of actions and arguments. I do not harbor ill will toward you or toward most of the people I trade insults with -- it just seems to be an inescapable part of having diverse opinions. But no one ever gets killed!

From: Dave_Ninjajr_Flory@cup.portal.com
Message-ID: <25425@cup.portal.com>
Source record: 245153

I had Analyze for a while and liked some of it but dropped it for the very same reason I dropped VIP, to slow. LDW is by far the fastest commercial spreadsheed I have seen for the ST. It loads 123 files and has a program on disk to convert its saved files to 123 format. I wouldn't call myself a power user, I don't use Macros at all, but I have used LDW on an almost daily basis for over a year, with never a problem. The only spreadsheet I like better is Excell, which I run as a Mac.

>"TOS version dated 04061989 unknown" and terminates.

My copy of CSD works just fine under TOS 1.4. It came with my version 3.0 update quite awhile ago. The version of csd.prg as returned by the MWC "version" utility is
e:\src\csd\csd\1988\4\11\14\51

I did have the problem you describe, not with CSD but with DB, the machine-level debugger. I fixed it by patching the executable to accept TOS 1.4, and it seems to work fine. I don't know why it was checking the TOS version in the first place. Maybe they were just being conservative about new versions of TOS for which the code had not been tested.

>are lots of people in that "they") need the PR in order to join the
>"net gods".

I hardly think this was the motive or the attitude of those who posted "energetic" responses. I think people are compelled to write about an issue they feel strongly about. Is that surprising?

> This all could've been handled, politely, with a few email
>messages to Dave telling him why he was wrong to setup a one way link
>to GEnie. He does read and answer his mail. (It does take awhile, his
>mail/news feed adds at least 1 day, and often 2 days, each directtion.)
>Instead there was a wild attack with no attempt to try milder measures.

Why is posting a public message (in itself) impolite? And why is it that you think people are being rude by describing the potential consequences of Dave's actions (wrong or no)? I just don't see what's wrong with public discussion. No one said "Dave Small is a damn jerk" or "Dave Small is trying to rip us off". In fact, most of the discussion was about GEnie's policies, not Dave. Dave was just caught in the middle because he was nice enough to try to do something good for the ST community.

> Oh well, maybe it was just time for a good flame war and Dave
>was just the easiest target.

This is unfair. Just because some of us disagree (and perhaps disagree very strongly) with Dave Small, you assume that we were flaming him. Do you think I`m flaming _you_ right now? I hope not.

I really hope Dave didn't get the impression that we (comp.sys.atari) think he's a rotten guy. If I recall correctly, NO ONE said he was.

I'm posting this question for somebody who doesn't have access to the net.

Has anybody heard about MONOGRAM. They had a program called "Dollars&Cents" or something like that. My friend is happy with the program but doesn't seem to be able to get his printer to work with it. When he tries to use the printer the ST hangs or something. Anybody out there has ever used this program and might be able to help? I'd appreciate.

Also I posted a question on scanners a few weeks ago (for that same person). Didn't have TOO many answers.

Come on guys, are you gonna help a poor lonely ST user out there in New Mexico who doesn't even have access to the net.

My. How lucky we are here in Massachusetts... Especially this time of year :-) (What's worse, not having access to the net and be the only ST user within 100 miles or have your hot water pipes freeze and burst?...)

Happy New Year all.

> sparked my curiousity; is there no legal way I can stop GENIE from
> copyrighting MY material if I post it on USENET?

Don't panic. You don't lose a thing.

A compilation copyright covers only the compilation. It does not remove a public-domain work from the public domain, nor does it infringe on your rights as author of a message (whatever that means -- since you're making public utterances, your rights to control their redistribution are pretty shaky).

An analogy may be helpful.

Let's imagine that you and I are both professors at Harvard University. We get in a loud argument on the steps of the library about the invasion of Panama.

We are so brilliant in our debating that we attract the attention of a wandering reporter for the New York Times, who takes extensive notes.

Later we renew our debate in a Usenet conference. One of the Times' several computer-literate reporters sees the exchange.

Eventually both our spoken and our written words are quoted at length in a Times story. The Times is protected by copyright and by an army of highly paid lawyers.

There is nothing we can do to prevent the profit-making Times from quoting us. There is nothing we can do to prevent the Times from claiming a copyright on the reporter's story. There is nothing we can do to prevent the Times from selling that story to the client newspapers of the New York Times News Service, thereby indirectly making even more profit on our brilliant debate.

However, there also is nothing the Times can do that could restrict us from reusing our brilliant words (perhaps we write books about our glorious encounter), nor is there anything the Times can do to prevent the New York Post or the Harvard Crimson from obtaining a transcript of our debate and publishing it.

There *is* something the Times can do if you, I or a third party clips the Times article and reprints it verbatim without permission, since it owns the reporter's work.

Disclaimer: Although, as an editor, I deal with issues such as these every day, I am neither lawyer nor judge. Even a lawsuit without validity can be expensive. Your mileage may vary.

4639. Music Composition Program Summary

Newsgroup: comp.sys.atari.st
Date: 1989-12-28 15:39:18 UTC
From: ROEDERT@ARIZVM1.BITNET
Message-ID: <8912290801.AA26701@ucbvax.Berkeley.EDU>
Source record: 245163

To begin, I would like to thank all of those who replied to my original request about scoring programs for the ST. To recap, I asked for recommendations about a good composition program that would produce good printed output, with sound output optional.

By and far, the largest number of replies I received recommended Hybrid Arts EZ-Score Plus. The output on 24-pin printers is good, and the program has the ability to play back through the sound chip or MIDI. Since this program can be had for around $100 US, it is probably the one I'm going to get.

Another recommendation was the ScoreST Music DTP program in the Jan. 1990 issue of Start. Since I receive Start, I tried it out. It seems to be quite useful, though it has no playback capability. However, I have not been able to get really good printouts from this program, though I'm still working on modifying the printer driver. This program is definately the cheapest, though.

The other recommendation made was from Take Control in England, and the name of the program is Music DTP. It was highly recommended, but seems a bit pricey for me.

That about covers it. Again, thanks to those who replied!

4640. USEnet on GEnie...a followup

Newsgroup: comp.sys.atari.st
Date: 1989-12-28 16:51:47 UTC
From: rjd@cs.brown.edu
Message-ID: <23792@brunix.UUCP>
Source record: 245164

Here's an interesting sidenote:

I was on GEnie last night, attending the Atari ST RT discussions.
(Every Wednesday night at 10:00 pm EST). I brought up the
USEnet->GEnie transfer topic. Most people didn't know it
existed, and those that did were *glad* that it stopped.
It seems that the USEnet messages were saturating the Atari ST
section. (Too much info, too fast.) People found they
couldn't keep up, even for the few days (hours?) it was operating.

This makes sense. When I was administering a UUCP site a year
ago, we'd get about 5 MBytes/week of USEnet articles. comp.sys.atari.st
is one of the more voluminous sections...I wonder if GEnie took
that into account. :) Probably started filling up their disk space.

I use D&S. it comes with GDOS 1.0, but is not compatible with it.
Printing suddenly came to life when I get GDOS 1.1 with another program.

So, either find GDOS 1.1, or try G+ (whatever), the gdos replacement.

one last time... just to clear up some points.

I have two versions up for anonymous FTP from xanth.cs.odu.edu.
One version is a zip, the other is a compressed and tarred directory
of the files AFTER they have been unzipped. I used a UNIX unzip since
I didnt have unzip for the ST. Although I THOUGHT .zip files were
self extracting archives. Nevertheless, there are two versions for FTP.

Steve Yelvington writes:
>There is nothing we can do to prevent the profit-making Times from quoting
>us. There is nothing we can do to prevent the Times from claiming a
>copyright on the reporter's story.

>However, there also is nothing the Times can do that could restrict us
>from reusing our brilliant words

Although I agree with this, my original posting on the subject was confined to the question of whether specific site distribution restrictions were enforceable. Here I would use an alternate analogy, that of a broadcast TV station that wishes to prohibit people on odd sides of the street from viewing their transmissions. Clearly such site restrictions are laughable and could never be enforced, practially or legally. Broadcasting over the airwaves or over USENET is, in principle, the same thing. If you want to narrow cast to preserve your right of distribution selection, you have to find means other than standard TV channels or USENET newsgroups.

> Even a lawsuit without validity can be expensive.

Agreed. Fortunately there are remedies to that also.

4646. 520 ST upgrade to 2.5 Meg

Newsgroup: comp.sys.atari.st
Date: 1989-12-28 21:04:35 UTC
From: gdr@PacBell.COM
Message-ID: <31728@pbhya.PacBell.COM>
Source record: 245170

I am trying to get my 520 upgraded. I am not too familiar with the innards of my machine, and after talking with some dealers I am even more confused.

1) Can the ease of upgrading the memory be dependent on which version of TOS I am running, or are these entirely separate issues?

2) One dealer says it will take three weeks, another says it takes an hour (and his cost is better too.) However, after 6 weeks the chips are not in yet. Other dealers confirm that the chips are hard to get. There is no dealer in the S.F. Bay Area that can do the work *now*, mainly because the chips are not available. Is this normal?

3) One dealer said that in January there will be a board that will accept plug-in memory chips. Is this really true? Will it really be in January (1990)?

4) Where can I get the chips, assuming I will have to get them myself, and dealers don't have them?

5) What sorts of things can go wrong during this procedure, and how can I test it afterwards? (I assume by reading & writing to the highest memory location???) I am conversant in assembler if the answer to this requires such.

It's been 4 solid months since the
Dusseldorf "announcement" of the TT
on August 25th, 1989.

Today is more than 30 days beyond the ATARI policy
of Show and Deliver. Can anybody in
Europe tell us non-Europeans that
you have indeed purchased a TT from
a dealer?

-kevin
ramsiri@blake.acs.washington.edu

PLEASE.. NO WARS on this one.. this is an
honest to goodness simple question.

4649. DEGAS pics to bitmaps?

Newsgroup: comp.sys.atari.st
Date: 1989-12-29 09:15:58 UTC
From: pa2027@sdcc13.ucsd.edu
Message-ID: <5838@sdcc6.ucsd.edu>
Source record: 245173

Ok, I'm new to software development on the ST, and I want to do
something fairly basic, but essential.
How do I convert a saved DEGAS pic or block and then convert it to a
bitmap so I can blit it around in C? Should I use DEGAS or some
other graphics program? Are there PD programs out there that will
convert a pic to data that I can load into memory?
Currently I'm using MWC.. how does Laser C compare? What is the
best
C compiler currently for the ST?

Anyway, any response via e-mail or posting to any of these questions
would be greatly appreciated!

thanks in advance!

A third party, eh? The box had the Atari logos and the board itself
had "Atari" etched into it...

> > And if you *really* need more capacity, then the TT is for you.
> > (Although you need to go to Europe to get one)
>
> Oh, the old 'buy another computer' upgrade. 8-P Only now we have to go to
> Europe to get it. I wonder how many Atari owners are that dedicated?
> Fortunately, I don't think that's the way it's going to turn out (at least
> I hope not).
>

Oh, but I am not wrong in my opinion that if you really need that
kind of computer, you should get one (TT). I distinctly remember
hearing that attitude about "why should I get an ST, when I
expanded my 800XL to 1Mb..." Similar arguments, in regards to "I
can do about what an ST does..." or something like that.

Not to denigrate the 8bit owners, but the ST can do alot more,
faster, better than an 8bit, and I am sure the same holds true that
a TT or ATW can do alot more faster, better than even my Mega 4.

I mean, it would sure look nice, but at the moment, I don't need,
say, multitasking. I just run a Mega 4 and 1040 side by side. Not
to mention my 800XL churning away on the side. (All I need is a
network)

Even now, the Macintosh has been pretty much eclipsed by the
Macintosh II family, and 286 machines have given way to 386
machines, that are about to be pushed aside by 486 jobbies...
(My opinion, on the surface) If only Atari could get the ball
rolling with the STE and TT here in the US, I feel that they would
replace the current ST line in a couple of years. (or would they,
considering the fierce devotion of American Atari ST owners?)

Does anyone out there know what object type the root of a menu is? Every silly book I have always starts out "then you run your resource program". I'm one of them assembly people who hates header files, and I'd like to include my object trees directly in the program. I've had success with other object types, but I can't find this one anywhere.

On a related note, does anyone have a working example of the function vro_copy? I can't seem to get it to do anything. My trials will make the call, and return, but nothing happens on the screen. I'm pretty sure I have the vdi stuff set up correctly (even the type of copy), but I'm stumped on this one. Lucky I wrote my own...

>get.
>
>Another recommendation was the ScoreST Music DTP program in the Jan. 1990
>Timothy Roeder
>

I bought Ez-Score Plus a couple of years ago. THe menus and options look promising.. but the quality of output I found was rather unacceptable on my Epson 24 pin. ALso, the version I had gave you 3 staves only.. that version was very buggy...
i made a list 3 pages long of very disturbing bugs or "features" of the program. Supposedly, a newer version was to support 6 staves... (This is extremely paltry this day and age.) I inquired for several months.. but no updates seemed to materialize. The playback feature is spartan... not a sequencer at all.. which is no problem if you simply want to hear straightforward playback... but there were strange timing problems .. pauses.. accelerandos and decelerandos inadvertant... Unless the program has improved.. you should LOOK at others before you buy... i GAVE my program to a friend who never uses it.

It may in fact be the "best" for $100... my suggestion is that, if this is so, save your money and get something more useful.

Music processors are like word processors.. you buy six different ones before you find one you like... and then, it's never perfect.
Keeps the future bright :-)

4653. Memory exapnsion & TeX/LaTeX

Newsgroup: comp.sys.atari.st
Date: 1989-12-29 17:10:34 UTC
From: mwjester@wsucsa.uucp
Message-ID: <9788@wsucsa.uucp>
Source record: 245177

2 somewhat related questions:

1. I would like to expand the memory of my 1040ST to 2 or 4 Mbytes. Is there a memory expansion board that is particularly good (reliable, well-engineered)? If so, where can I get it, and what will it cost me?

2. I recently ftp'ed TeX from terminator.cc.umich.edu, and would like to get it running on my ST (the reason for question #1). I'm assuming that I can use style files downloaded from our local VAX - what about fonts? If anyone has TeX running on his/her ST, would that/those person(s) tell me what works well in terms of subdirectories, shell setups, etc.? Is it possible to run TeX from the desktop using SETENV?

Feel free to Email any replies; I'll summarize and post if there is interest.

Max Jester

Source record: 245178

Can someone suggest a relatively simple upgrade kit to get my ST up to
2.5 meg or 4 meg?
(I got the RF shielding off my ST finally and saw that there were two rows for
ram chips. I guess this means if I fill (soldier in sockets for, etc.) the
second row with 512Kbit chips, I'll have 2.5 meg, or if I desoldier the 16
256Kbit chips and replace everything with 1Megbit chips I'll get my 4 Meg?
However, I'm not up to that at the moment (especially if any trace cutting is
involved))
Send mail to me, if anyone else is interested I'll mail him (generic 3rd person
singular pronoun) a summary or if enough people are interested, I'll post a
summary to the net.

From: dsmall@well.UUCP
Message-ID: <15252@well.UUCP>
Source record: 245181

The base note (sigh) once again talks about USENET->Genie. It says
that GEnie will copyright the USENET notes.

I have high hopes that they won't. Maybe I'm wrong. I've put in front
of them the well-written objections people here have, and asked if we can't
work something out. I'll let everyone know what I hear, good or bad.

But it seems plainly silly to try to copyright something that's
spread across the country USENET style, grass-roots.

Sure, Genie is into it for connect time, as is CIS, BIX, Portal,WELL,
etc.

Again, I have heard *nothing* that says that GEnie would try to
copyright the notes -- and I am trying to get them to say they won't.
In my opinion it is in their best interests not to.

So please go easy on the "Genie is Darth Vader" image, okay?

Let's wait and see what they do before judging them. Heck, they
bent the rules for me during the Data Pacific / Gadgets fiasco,and supported
me,and ended up doing well. I think they're capable of doing it again.

Let's not prejudge; let's wait and see.

Gosh, well I have designed PC boards and etched them. But the reason
that I'm not claiming an expert opinion is this:

Maybe the second design was so much cheaper that it saved money
despite the lower production volume and separate inventories?

If you have an expert answer for this question, you must be an
accountant that works for Atari. Since you aren't...

4659. Re: USEnet on GEnie...a followup

Newsgroup: comp.sys.atari.st
Date: 1989-12-30 06:45:53 UTC
From: dsmall@well.UUCP
Message-ID: <15253@well.UUCP>
Source record: 245183

The basenote describes the GEnie Wednesday night conference and the mention of the USENET, err, discussion there.

Rob, the comp.sys.atari uplink to GEnie has barely been mentioned in the ST area. Remember, it's in a *completely* different area,the Gadgets RT, which is like a whole nuther newsgroup. It certainly wasn't flooding the ST area; it couldn't,it was in the Gadgets area. We kept it well under control in the Gadgets Category 10 all by itself.

GEnie has awesome disk space -- they just don't delete notes. There's stuff on there going back for years.

Anyway, I'm sure you had good motives, and just wanted to clear this up lest someone unfamiliar with GEnie think we were wreaking havoc inthe Atari ST RT ... nope, just one category, of 14 or so, in the Gadgets area.

4662. Changing Rez: What we _really_ want to know

Newsgroup: comp.sys.atari.st
Date: 1989-12-30 19:17:48 UTC
From: dmb@TIS.COM
Message-ID: <8912301917.AA19200@TIS.COM>
Source record: 245186

A bit of summary for those just tuning in:

I asked if you could change rez without the Bios. Atari's Derek Mui
said "No."

Then Neil Forsyth asked if you could restore the desktop resolution
from within a function installed at GEM process termination vector 0x102.

Allan said:

Yes. I wrote an off-the-cuff article "all about terminate handlers"
on GEnie, then asked John Townsend to post it here. I don't know if he
has, but among other things, it says you can make BIOS and XBIOS calls
but not GEMDOS calls.

Then Ken said:

Neil asks if there are magic negative-offset line A variables which can be
stuffed with appropriate values to fool GEM if an application changes res.

The answer is: No.

[AES has no published variables so you can't tell it about res changes]

Derek Mui is very wise in the ways of the AES, and when he says there
is no way, legal or illegal... believe him!

And now (me):

We believe! We believe!

OK, OK, we know you can't tell AES and GEM about the rez change. But
suppose we _don't care_ about GEM and AES and we just want the VDI/line A
to work correctly. My problem isn't with GEM or AES, but rather with the
VT52 emulator. Here's the scenario:

1) Run program from (medium rez) GULAM.
2) In program, change rez to low. AES is screwed. I don't care.
3) Process termination occurs. I switch back to medium rez
without the Bios.
4) GULAM thinks the screen is only 40 columns wide. Bummer.

Although Allan says you can call the Bios from within a routine installed
as process termination handler (at 0x102), I sure couldn't. Adding the
single line

```
Setscreen(-1L, -1L, 1);
```

causes my program to crash horribly.

The point is, I just want to be able to duplicate the functionality of Setscreen without calling the Bios. Either that, or I'd like to find out what the secret is to calling Bios routines at process termination.

Ideas?

Thanks,
Dave Baggett
(dmb@TIS.COM)

P.S.> Could some kind soul please repost the "all about terminate handlers" article here? Thanks.

At last, a local dealer actually admits that the 1.4 roms exist, but he wants to charge me $180 (CDN) for the set, installed. They are refusing to sell me the roms at a reasonable price so that I can install them myself. Heck, I installed the 1.0 roms myself, what could be so difficult about the new ones that requires dealer installation? Are the pins bent into a corkscrew to avoid problems with the CHEAP sockets and thus require some special insertion tool?

Can I buy them from somewhere else, ie. mail order, etc.?

4665. Aerco 4 Meg ram upgrade boards

Newsgroup: comp.sys.atari.st
Date: 1989-12-30 22:06:10 UTC
From: johna@van-bc.UUCP
Message-ID: <131@van-bc.UUCP>
Source record: 245189

Does anybody have any information on how to add 1 Meg chips to the Aerco "easieST" solderless ram upgrade for a 520? The literature that came with the board claimed that the board would hold up to 4 Meg, but neglected to state how the extra ram should be added to the sockets provided. Since I could not afford the 1 Meg ram chips when I bought the kit, I didn't bother finding out how it was done.

I tried the most obvious method of plugging the chips into the extra sockets in the orientation implied by the dimple on the sockets themselves. This resulted in the ram test program insisting that I had 2.5 Meg, but I wound up with 3 partial images of everything on the screen. The ram check program would crash with several bombs, the number of bombs not repeatable. Just for the fun of it, I removed all but one of the extra chips, and had exactly the same results. Now how robust can the power-up memory check (not test) be if it will find ram on the basis of one bit being set?

Any hints anybody? Do I have to toss the board (it was ~ $250 back in 1987) and buy a different one? For a little extra info, my ST has sticker saying it was made in 7 1985.

Does Aerco still exist? They have not replied to a letter I sent them on October 31 (I think that two months should be ample time to reply).

Welcome to the last posting of "The List" in the 1980's. Thanks to
Roland Waldi, 7 new formats have been added. At Roland's suggestion,
standard filename extensions are now listed as well.

Minor changes have been made to the DEGAS Elite description. (Color
animation delay was incorrect.) Additionally, I've discovered some
unpleasant caveats with compressed DEGAS Elite pics which are now
documented.

New formats include:

GEM Bit Image, Image, Doodle, STAD, Imagic Film/Picture, Art Director, IFF

Please take a look at these new ones and report any glaring problems.

Happy new year!

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is color register zero (background), last word is color register 15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each palette entry, since a few programs store special information there (most notably Art Studio).

The Formats

<NEOchrome> *.NEO

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (usually " . ")
1 byte unused (?) (usually either 80 hex or 0)
1 byte color animation limits (4 most significant bits are left/lower limit; 4 least significant bits are right/upper limit).
1 byte color animation enabled? High bit set if yes.
1 byte color animation speed and direction
x = 0 means animation stopped

```
x < 0 means colors cycle to the left (decreasing)
x > 0 means colors cycle to the right (ascending)
Number of vblanks between cycles is |x| - 1
19 longs reserved for expansion
16000 words picture data (screen memory)
-----------
32128 bytes total

<NEOchrome Animation> *.ANI

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click both mouse buttons in the eye of the second R in the
word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
--------
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
```

4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words 128 - animation channel delay in 1/60's of a second. [0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a second.)

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (not used)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the highest
order bit plane of scan line zero, followed by the data for the next lower
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the highest order bit plane of scan line one, followed by the data for
the next lower order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being decompressed.

o Whenever a control command is encountered, bytes are stuffed
in this buffer.

o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

<Tiny> *.TNY (any resolution)
*.TN1 (low resolution)
*.TN2 (medium resolution)
*.TN3 (high resolution)

Several people have reported sightings of mutated Tiny pictures that
do not follow the standard format, so let's be careful out there. What
is described here is the format that David Mumper's original
TNYSTUFF.PRG produces.

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies

the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides medium resolution pictures into four parts.

<Spectrum 512> *.SPU

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)> *.SPC

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).
Yes, it is hideously complex.

<Art Director> *.ART (low resolution only)

16000 words picture data (screen memory)
16 words palette
15 * 16 words 15 more palettes for animation

32512 bytes total

<C.O.L.R. Object Editor Mural> *.MUR (low resolution only)

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Doodle> *.DOO (high resolution only)

16000 words picture data (screen memory)

32000 bytes total

<Animatic Film> *.FLM (low resolution only)

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)

```
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse (change direction)
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<GEM Bit Image> *.IMG

2 words upper left x,y of bit image
2 words lower right x,y of bit image
1 word device page width
1 word device page height
1 word device pixel width in microns
1 word device pixel height in microns
1 word NBITSPPXL, (bits per pixel, planes, for color information)
7 words reserved (0)
--------
32 bytes total for header

? bytes data

Format of data

Run-length packet:
+0 [1] run length (1..127)
+1 [1] color index (1..255)

Extended packet:
+0 [1] -1 (opcode, $FF)
+1 [1] extended run length (i.e. *128 pixels)
+2 [1] color index

Raster packet:
+0 [1] -2 (opcode, $FE)
+1 [1] NPXL, # of pixels in stream
+2 [..] packed color indices [NPXL*NBITSPPXL bits]

Raster-run packet:
+0 [1] ? (opcode)
+1 [1] pattern repeat count
+2 [1] NPXL, # of pixels in stream
+3 [..] packed color indices
```

<Image> *.IMG

1 word version number of image file
1 word length of header in words [8]
1 word number of color planes
1 word pattern length in bytes [2]
1 word pixel width in 1/1000 mm
1 word pixel height in 1/1000 mm
1 word line width in pixels
1 word number of lines
----
16 bytes total for header

? bytes data

For each byte x in the data section,

x = 0 Pattern/scanline run.
Read the next byte, n (unsigned).

If n > 0 then:
Read a number of bytes equal to the "pattern
length" word in the header. Repeat this
pattern n times.

If n = 0 then:
Scanline run. Data for the next scanline
is to be used multiple times. Read the
following record:

1 word unused (?) [255]
1 word number of times to use
next scanline data

The data for the next scanline follows,
compressed normally.

x = 80 (hex) Uncompressed bit string. The next byte
determines the number of bytes (?) to use
literally. The literal data bytes follow.

otherwise Monochrome run. The value of x determines
what to draw. The high bit specifies the color.
The low 7 bits, taken as an unsigned quantity,
specify the length of the run (the number
of pixels to draw).

<STAD> *.PAC (high resolution only)

4 bytes "pM86" (vertically packed) or "pM85" (horizontally packed)
1 byte id byte
1 byte pack byte (most frequently occuring byte in bitmap)
1 byte "special" byte
----
7 bytes total for header

? bytes data

The data is encoded as follows. For each byte x in the data section:

x = id byte Read one more byte, n. Use pack byte
n + 1 times.
x = "special" byte Read two more bytes, d, and n (in order).
Use byte d n times.
otherwise Use byte x literally.

<Imagic Film/Picture> *.IC1 (low resolution)
*.IC2 (medium resolution)
*.IC3 (high resolution)

4 bytes "IMDC"
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
1 word date (GEMDOS format)
1 word time (GEMDOS format)
8 bytes name of base picture file (for delta compression), or zeroes
1 word length of data (?)
1 long registration number
8 bytes reserved
1 byte compressed? (0 = no, 1 = yes)

If compressed {
1 byte delta-compressed? (-1 = no, > -1 = yes)
1 byte ?
1 byte escape byte
}
----
65 bytes total for header (68 bytes if compressed)

? bytes data

Compressed data may be either stand-alone or delta-compressed (relative
to the base picture named in the header). Delta compression involves
storing only how the picture differs from the base picture (i.e., only
portions of the screen that have changed are stored). This is used to
to encode animated sequences efficiently.

Compressed data, stand-alone:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 2, use the next byte n times.
If n = 1, keep reading bytes until a
byte k not equal to 1 is encountered.
Then read the next byte d.
If the number of 1 bytes encountered is o,
use d (256 * o + k) times. I.e.,

```
if (n == 1) {
o = 0;
while (n == 1) {
o++;
n = next byte;
}

k = n;
d = next byte;

Use d (256 * o + k) times.
}
else {
d = next byte;
Use d (n) times.
}

x != escape byte Use x literally.

Compressed data, delta compressed:

For each byte x in the data section:

x = escape byte Read one more byte, n. (n is unsigned).

If n >= 3, use the next byte n times.
If n = 1, do the same as for n = 1 in
stand-alone compression (above).
If n = 2, then set n = next byte.
If n = 0, end of picture.
If n >= 2, take n bytes from base
picture.
If n = 1, do the same as for n = 1
in stand-alone compression (above),
but take (256 * o + k) bytes from
base picture.

x != escape byte Use x literally.

<IFF Format> *.IFF

4 bytes "FORM"
8 bytes form chunk: 1 long = length (8)
4 bytes = ID ("ILBM")
4 bytes "BMHD"
20 bytes BMHD chunk: 1 long = length (20)
(BitMap 1 word = x width (pixel)
HeaDer) 1 word = y height (pixel)
1 word = x-offset (pixel)
1 word = y-offset (pixel)
1 byte = # bitplanes
1 byte = mask (0=no, 1=impl., 2=transparent,
3=lasso)
1 byte = compressed (1) or expanded (0)
```

```
1 byte = 0
1 word = transparent color (for mask=2)
1 byte = x-aspect
1 byte = y-aspect
1 word = page width
1 word = page height
4 bytes "CMAP"
3n+8 bytes CMAP chunk: 1 long = length (3n + 8 for n colors)
(Color 3 words = R,G,B color 0
MAP) ...
3 words = R,G,B color n
4 bytes "CRNG"
8 bytes CRNG chunk: 1 long = length (8)
(Color 1 word = 0
RaNGe) 1 word = animation speed
1 word = active (1) or inactive (0)
4 bytes "BODY"
? bytes body chunk: picture expanded/compressed

Format of body data

An expanded picture is simply a bitmap. The compressed data consists
of records of single control bytes followed by data.

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= -1 Use the next byte -x + 1 times

The (decompressed) body data appears in the following order:

line 1 plane 0 ... line 1 plane 1 ... ... line 1 plane m
[line 1 mask (if appropriate)]
line 2 plane 0 ... line 2 plane 1 ... ... line 2 plane m
[line 2 mask (if appropriate)]
...
line x plane 0 ... line x plane 1 ... ... line x plane m
[line x mask (if appropriate)]

The FORM chunk identifies the type of data:

"ILBM" = interleaved bit map
"8SVX" = 8-bit sample voice
"SMUS" = simple music score
"FTXT" = formatted text (Amiga)

Note:
The R,G,B ranges of AMIGA and ST are different (AMIGA 0...15, ST 0...7),
as is the maximum number of bitplanes (AMIGA: 5, ST: 4).

Animation speed of 16384 means 1 full rotation in 1/60's of a second.

<MacPaint>
```

Word has it that this is wrong. Someone please send me an accurate description!

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
83 longs reserved
} (total 160 longwords for header)
< 51200 bytes compressed bitmap data

< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a control byte followed by one or more data bytes. The meaning of the control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white, 1 = black.
